ROYAL ACADEMY. 1887. ALF COOKE, LEEDS.

## HIS FÊTE DAY.

*From the picture by Frank W. W. Topham, R.I.*

# THE LEISURE HOUR.

rary,
AN 11 1893
DETROIT, MICH.

## THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN, AUTHOR OF "THE HOUSE OF THE WOLF," ETC.

HE STOPPED ME BY A GESTURE OF STERN COMMAND.

### CHAPTER I.—"HÉ, SIRE ANE, HE!"

ON the boundary line between the two counties of Warwick and Worcester there is a road very famous in those parts, and called the Ridgeway. Father Carey used to say—and no better Latinist could be found for a score of miles round in the times of which I write—that it was made by the Romans. It runs north and south along the narrow spine of the country, which is spread out on either side like a map, or a picture. As you fare southwards you see on your right hand the green orchards and pastures of Worcestershire stretching as far as the Malvern Hills. You have in front of you Bredon Hill, which is a wonderful hill, for if a man goes down the Avon by boat it goes with him—now before, and now behind—a whole day's journey, and then stands in the same place. And on the left hand you have the great Forest of Arden, and not much besides, except oak-trees, which grow well in Warwickshire.

I describe this road, firstly, because it is a notable one, and forty years ago was the only Queen's highway, to call a highway, in that country. The rest were mere horse-tracks. Secondly, because the chase wall of Coton End runs along the side of it

for two good miles; and the Cluddes—I am Francis Cludde—have lived at Coton End by the Ridgeway time out of mind, probably—for the name smacks of the soil—before the Romans made the road. And thirdly, because forty years ago, on a drizzling February day in 1555—second year of Mary, old religion just re-established—a number of people were collected on this road, forming a group of a score or more, who stood in an ordered kind of disorder about my uncle's gates and looked all one way, as if expecting an arrival, and an arrival of consequence.

First, there was my uncle Sir Anthony, tall and lean. He wore his best black velvet doublet and cloak, and had put on with them an air of huge importance. This increased each time he turned, staff in hand, and surveyed his following, and as regularly gave place to a "Pshaw!" of vexation

FIRST, THERE WAS MY UNCLE, SIR ANTHONY, TALL AND LEAN.

and a petulant glance when his eye rested on me. Close beside him, looking important too, but anxious and a little frightened as well, stood Father Carey. The priest wore his silk cassock, and his lips moved from time to time without sound, as though he were trying over a Latin oration—which, indeed, was the fact. At a more respectful distance were ranged Baldwin Moor, the steward, and a dozen servants; whi'e still further away lounged as many ragamuffins—landless men, who swarmed about every gentleman's door in those times, and took toll of such abbey lands as the king might have given him. Against one of the stone gate-pillars I leaned myself—nineteen years and six months old, and none too wise, though well grown, and as strong as one here and there. And perched on the top of the twin post, with his chin on his knees, and his hands clasped about them, was Martin Luther the fool.

Martin had chosen this elevated position partly out of curiosity, and partly, perhaps, under a strong sense of duty. He knew that, whether he would or no, he must needs look funny up there. His nose was red, and his eyes were running, and his teeth chattering; and he did look funny. But as he felt the cold most his patience failed first. The steady, silent drizzle, the mist creeping about the stems of the oak-trees, the leaden sky, proved too much for him in the end. "A watched pot never boils!" he grumbled.

"Silence, sirrah!" commanded my uncle angrily. "This is no time for your fooling. Have a care how you talk in the same breath of pots and my Lord Bishop!"

"*Sanctae ecclesiae!*" Father Carey broke out, turning up his eyes in a kind of ecstasy, as though he were knee to knee with the prelate—"*te defensorem inclytum atque ardentem—*"

"*Pottum!*" cried I, laughing loudly at my own wit.

It was an ill-mannered word, but I was cold and peevish. I had been forced to this function against my will. I had never seen the guest whom we were expecting, and who was no other than the Queen's Chancellor, Stephen Gardiner, but I disliked him as if I had. In truth, he was related to us in a peculiar fashion, which my uncle and I naturally looked at from different standpoints. Sir Anthony viewed with complacence, if not with pride, any connection with the powerful Bishop of Winchester, for the knight knew the world, and could appreciate the value it sets on success, and the blind eyes it has for spots if they do but speckle the risen sun. I could make no such allowance, but, with the pride of youth and family, at once despised the great Bishop for his base blood, and blushed that the shame lay on our side. I hated this parade of doing honour to him, and would fain have hidden at home with Petronilla, my cousin, Sir Anthony's daughter, and awaited our guest there. The knight, however, had not permitted this, and I had been forced out, being in the worst of humours.

So I said, "*Pottum!*" and laughed.

"Silence, boy!" cried Sir Anthony, fiercely. He loved an orderly procession, and to arrange things decently. "Silence!" he repeated, darting an angry glance first at me and then at his followers, "or I will warm that jacket of yours, lad! And you, Martin Luther, see to your tongue for the next twenty-four hours, and keep it off my Lord Bishop! And, Father Carey, hold yourself ready—"

"For here Sir Hot-Pot cometh!" cried the undaunted Martin, skipping nimbly down from his post of vantage; "and a dozen of London saucepans with him, or may I never lick the inside of one again!"

A jest on the sauciness of London serving-men was sure to tell with the crowd, and there was a great laugh at this, especially among the landless men, who were on the skirts of the party, and well sheltered from Sir Anthony's eye. He glared about him, provoked to find at this critical moment smiles where there should have been looks of deference, and a ring round a fool where he had

marshalled a procession. Unluckily he chose to visit his displeasure upon me.

"You won't behave, won't you, you puppy!" he cried. "You won't, won't you!" and stepping forward he aimed a blow at my shoulders, which would have made me rub myself if it had reached me. But I was too quick. I stepped back, the stick swung idly, and the crowd laughed.

And there the matter would have ended, for the Bishop's party were now close upon us, had not my foot slipped on the wet grass and I fallen backwards. Seeing me thus at his mercy, the temptation proved too much for the knight. He forgot his love of seemliness—and even that his visitors were at his elbow—and, stooping a moment to plant home a couple of shrewd cuts, cried, "Take that! Take that, my lad!" in a voice that rang as crisply as his thwacks.

PERCHED ON THE TOP OF THE POST WAS MARTIN LUTHER THE FOOL.

I was up in an instant; not that the pain was anything, and before our own people I should have thought as little of shame, for if the old may not lay hand to the young, being related, where is to be any obedience? Now, however, my first glance met the grinning faces of strange lackeys, and while my shoulders still smarted, the laughter of a couple of soberly-clad pages stung a hundred times more sharply. I glared furiously round, and my eyes fell on one face—a face long remembered. It was that of a man who neither smiled nor laughed; a man whom I recognised immediately, not by his sleek hackney or his purple cassock, which a riding-cloak partially concealed, or even by his jewelled hand, but by the keen glance of power which passed over me, took me in, and did not acknowledge me, which saw my humiliation without interest or amusement. The look hurt me beyond smarting of shoulders, for it conveyed to me in the twentieth part of a second how very small a person Francis Cludde was, and how very great a personage was Stephen Gardiner, whom in my thoughts I had presumed to belittle.

I stood irresolute a moment, shifting my feet and glowering at him, my face on fire. But when he raised his hand to give the Benediction, and the more devout, or those with mended hose, fell on their knees in the mud, I turned my back abruptly, and, climbing the wall, flung away across the chase.

"What, Sir Anthony!" I heard him say as I stalked off, his voice ringing clear and incisive amid the reverential silence which followed the Latin words; "have we a heretic here, cousin? How is this? So near home too!"

"It is my nephew, my Lord Bishop," I could hear Sir Anthony answer, apology in his tone; "and a wilful boy at times. You know of him; he has queer notions of his own, put into his head long ago."

I caught no more, my angry strides carrying me out of earshot. Fuming, I hurried across the long damp grass, avoiding here and there the fallen limb of an elm or a huge round of holly. I wanted to get out of the way, and be out of the way; and made such haste that before the slowly-moving cavalcade had traversed one-half of the interval between the road and the house I had reached the bridge which crossed the moat, and, pushing my way impatiently through the maids and scullions who had flocked to it to see the show, had passed into the courtyard.

The light was failing, and the place looked dark and gloomy in spite of the warm glow of burning logs which poured from the lower windows, and some show of green boughs which had been placed over the doorways in honour of the occasion. I glanced up at a lattice in one of the gables—the window of Petronilla's little parlour. There was no face at it, and I turned fretfully into the hall—and yes, there she was, perched up in one of the high window-seats. She was looking out on the chase, as the maids were doing.

Yes, as the maids were doing. She too was watching for his High Mightiness, I muttered, and that angered me afresh. I crossed the rushes in silence, and climbed up beside her.

"Well," I said ungraciously, as she started, hearing me at her shoulder—"well, have you seen enough of him yet, cousin? You will, I warrant you, before he leaves. A little of him goes far."

"A little of whom, Francis?" she asked simply.

Though her voice betrayed some wonder at my rough tone, she was so much engaged with the show that she did not look at me immediately. This of course kept my anger warm, and I began to feel that she was in the conspiracy against me.

"Of my Lord of Winchester, of course," I answered, laughing rudely—"of Sir Hot-Pot!"

"Why do you call him that?" she remonstrated in gentle wonder. And then she did turn her soft dark eyes upon me. She was a slender, willowy girl in those days, with a complexion clear yet pale—a maiden all bending and gracefulness, yet with a great store of secret firmness, as I was to learn. "He seems as handsome an old man," she con-

tinued, "as I have ever met, and stately and benevolent, too, as I see him at this distance. What is the matter with you, Francis? What has put you out?"

"Put me out!" I retorted angrily. "Who said anything had put me out?"

But I reddened under her eyes; I was longing to tell her all, and be comforted, while at the same time I shrank with a man's shame from saying to her that I had been beaten.

"I can see that something is the matter," she said sagely, with her head on one side, and that air of being the elder which she often assumed with me, though she was really the younger by two years. "Why did you not wait for the others? Why have you come home alone? Francis" (with sudden conviction), "you have vexed my father! That is it!"

"He has beaten me like a dog!" I blurted out passionately; "and before them all! Before those strangers he flogged me!"

She had her back to the window, and some faint gleam of wintry sunshine, passing through the gules of the shield blazoned behind her, cast a red stain on her dark hair and shapely head. She was silent, probably through pity or consternation; but I could not see her face, and misread her. I thought her hard, and, resenting this, bragged on with a lad's empty violence.

"He did; but I will not stand it! I give you warning, I won't stand it, Petronilla!" and I stamped, young bully that I was, until the dust sprang out of the boards, and the hounds by the distant hearth jumped up and whined. "No! not for all the base bishops in England!" I continued, taking a step this way and that. "He had better not do it again! If he does, I tell you it will be the worse for some one!"

"Francis," she exclaimed abruptly, "you must not speak in that way!"

"BE SILENT, SIR!" AND THIS TIME I WAS SILENT.

But I was too angry to be silenced, though instinctively I changed my ground.

"Stephen Gardiner!" I cried furiously. "Who is Stephen Gardiner, I should like to know? He has no right to call himself Gardiner at all! Dr. Stephens he used to call himself, I have heard. A child with no name but his godfather's: that is what he is, for all his airs and his bishopric! Who is he to look on and see a Cludde beaten? If my uncle does not take care—"

"Francis!" she cried again, cutting me short ruthlessly. "Be silent, sir!" (and this time I was silent). "You unmanly boy," she continued, her

face glowing with indignation, "to threaten my father before my face! How dare you, sir? How dare you? And who are you, you poor child," she exclaimed, with a startling change from invective to sarcasm—"who are you to talk of bishops, I should like to know?"

"One," I said sullenly, "who thinks less of cardinals and bishops than some folk, Mistress Petronilla!"

"Ay, I know," she retorted scathingly—"I know that you are a kind of half-hearted Protestant—neither fish, flesh, nor fowl!"

"I am what my father made me!" I muttered.

"At any rate," she replied, "you do not see how small you are, or you would not talk of bishops. Heaven help us! That a boy who has done nothing and seen nothing, should talk of the Queen's Chancellor! Go! Go out, you foolish boy, and rule a country, or cut off heads, and then you may talk of such men—men who could unmake you and yours with a stroke of the pen! You, to talk so of Stephen Gardiner! Fie, fie, I say! For shame!"

I looked at her, dazed and bewildered, and had long afterwards in my mind a picture of her as she stood above me in the window bay, her back to the light, her slender figure drawn to its full height, her hand extended towards me. I could scarcely understand or believe that this was my gentle cousin. I turned without a word and stole away, not looking behind me. I was cowed.

It happened that the servants came hurrying in at the moment with a clatter of dishes and knives, and the noise covered my retreat. I had a fancy afterwards that as I moved away Petronilla called to me. But at the time, what with the confusion and my own disorder, I paid no heed to her, but got myself blindly out of the hall, and away to my own attic.

It was a sharp lesson. But my feelings when, being alone, I had time to feel, need not be set down. After events made them of no moment, for I was even then on the verge of a change so great that all the threats and misgivings, the fevers and agues, of that afternoon, real as they seemed at the time, became in a few hours as immaterial as the dew which fell before yesterday's thunderstorm.

The way the change began to come about was this. I crept in late to supper, facing the din and lights, the rows of guests and the hurrying servants, with a mixture of shame and sullenness. I was sitting down with a scowl next the Bishop's pages—my place was beside them, half-way down the table, and I was not too careful to keep my feet clear of their clothing—when my uncle's voice, raised in a harsher tone than was usual with him, even when he was displeased, summoned me.

"Come here, sirrah!" he cried roundly. "Come here, Master Francis! I have a word to speak to you!"

I went slowly, dragging my feet, while all looked up, and there was a partial silence. I was conscious of this, and it nerved me. For a moment, indeed, as I stepped on to the daïs I had a vision of scores of candles and rushlights floating in mist, and of innumerable bodiless faces all turned up to me. But the vision and the mistiness passed away, and left only my uncle's long thin face inflamed with anger, and beside it, in the same ring of light, the watchful eyes and stern impassive features of Stephen Gardiner. The Bishop's face and his eyes were all I saw then; the same face, the same eyes, I remembered, which had looked unyielding into those of the relentless Cromwell and had scarce dropped before the frown of a Tudor. His purple cap and cassock, the lace and rich fur, the chain of office, I remembered afterwards.

"Now, boy," thundered Sir Anthony, pointing out the place where I should stand, "what have you to say for yourself? why have you so misbehaved this afternoon? Let your tongue speak quickly, do you hear, or you will smart for it. And let it be to the purpose, boy!"

I was about to answer something—whether it was likely to make things worse or better, I cannot remember—when Gardiner stayed me. He laid his hand gently on Sir Anthony's sleeve, and interposed. "One moment," he said mildly, "your nephew did not stay for the Church's blessing, I remember. Perhaps he has scruples. There are people nowadays who have. Let us hear if it be so."

This time it was Sir Anthony who did not let me answer. "No, no," he cried hastily—"no, no; it is not so. He conforms, my lord, he conforms. You conform, sir," he continued, turning fiercely upon me, "do you not? Answer, sir."

"Ah!" the Bishop put in with a sneer, "you conform, do you?"

"I attend mass—to please my uncle," I replied boldly.

"He was ill brought up as a child," Sir Anthony said hastily, speaking in a tone which those below could not hear. "But you know all that, my lord—you know all that. It is an old story, to you. So I make, and I pray you to make for the sake of the house, some allowance. He conforms; he undoubtedly conforms."

"Enough!" Gardiner assented. "The rest is for the good priest here, whose ministrations will no doubt in time avail. But a word with this young gentleman, Sir Anthony, on another subject. If it was not to the holy office he objected, perhaps it was to the Queen's Chancellor, or to the Queen?" He raised his voice with the last words and bent his brows, so that I could scarcely believe it was the same man speaking. "Eh, sir, was that so?" he continued severely, putting aside Sir Anthony's remonstrance and glowering at me. "It may be that we have a rebel here instead of a heretic."

"God forbid!" cried the knight, unable to contain himself. It was clear that he repented already of his ill-timed discipline. "I will answer for it that we have no Wyatts here, my lord."

"That is well!" the Chancellor replied. "That is well!" he repeated, his eyes leaving me and roving the hall with so proud a menace in their glance that all quailed, even the fool. "That is very well," he said, drumming on the table with his fingers; "but let Master Francis speak for himself."

"I never heard," said I, boldly—I had had a

moment for thought—"that Sir Thomas Wyatt had any following in this country. None to my knowledge. As for the Queen's marriage with the Prince of Spain, which was the ground, as we gathered here, of Wyatt's rising with the Kentish folk, it seems a matter rather for the Queen's grace than her subjects. But if that be not so, I, for my part, would rather have seen her married to a stout Englishman—ay, or to a Frenchman."

"And why, young gentleman?"

"Because I would we kept at peace with France. We have more to gain by fighting Spain than fighting France," I answered bluntly.

My uncle held up his hands. "The boy is clean mad!" he groaned. "Who ever heard of such a thing? With all France, the rightful estate of her Majesty, waiting to be won back, he talks of fighting Spain! And his own grandmother was a Spaniard!"

"I am none the less an Englishman for that!" I said; whereon there was a slight murmur of applause in the hall below. "And for France," I continued, carried away by this, "we have been fighting it, off and on, as long as men remember; and what are we the better? We have only lost what we had to begin. Besides, I am told that France is five times stronger than it was in Henry the Fifth's time, and we should only spend our strength in winning what we could not hold. While as to Spain—"

"Ay, as to Spain?" grumbled Sir Anthony, forgetting his formidable neighbour, and staring at me with eyes of wonder. "Why, my father fought the French at Guinegate, and my grandfather at Cherbourg, and his father at Agincourt! But there! As to Spain, you popinjay?"

"Why, she is conquering here," I answered warmly, "and colonising there among the newly-discovered countries of the world, and getting all the trade and all the seaports, and all the gold and silver; and Spain, after all, is a nation with no greater strength of men than England. Ay, and I hear," I cried, growing more excited and raising my voice, "that now is our time or never! The Spaniards and the Portuguese have discovered a new world over seas.

'A Castilla y á Leon
Nuevo mundo dió Colon!'

say they; but depend upon it every country that is to be rich and strong in the time that is coming must have part in it. We cannot conquer either Spain or France; we have not men enough. But we have docks and sailors, and ships in London and Fowey, and Bristol and the Cinque Ports, enough to fight Spain over the great seas, and I say, 'Have at her!'"

"What next?" groaned Sir Anthony, piteously. "Did man ever hear such crackbrained nonsense?"

But I think it was not nonsense, for his words were almost lost in the cry which rang through the hall as I ceased speaking—a cry of English voices. One moment my heart beat high and proudly with a new sense of power; the next, as the shadow of a cloud falls on a sunny hillside, the cold sneer on the statesman's face fell on me and chilled me. His set look had neither thawed nor altered, his colour had neither come nor gone. "You speak your lesson well, lad," he said. "Who taught you statecraft?"

I grew smaller, shrinking with each word he uttered; and faltered, and was dumb.

"Come," he said, "you see but a little way; yet country lads do not talk of Fowey and Bristol! Who primed you?"

"I met a Master Sebastian Cabot," I said reluctantly at last, when he had pressed me more than once, "who stayed awhile at a house not far from here, and had been Inspector of the Navy to King Edward. He had been a seaman seventy years, and he talked—"

"Too fast!" said Gardiner, with a curt nod. "But enough, I understand. I know the man. He is dead."

He was silent then, and seemed to have fallen suddenly into thought, as a man well might who had the governing of a kingdom on his shoulders.

Seemingly he had done with me. I looked at Sir Anthony. "Ay, go!" he said irritably, waving me off. "Go!"

And I went. The ordeal was over, and over so successfully that I felt the humiliation of the afternoon cheap at the price of this triumph; for, as I stepped down, there was a buzz around me, a murmur of congratulation and pride and excitement. On every Coton face I marked a flush, in every Coton eye I read a sparkle, and every flush and every sparkle was for me. Even the Chancellor's secretaries, grave, down-looking men, all secrecy and caution, cast curious glances at me, as though I were something out of the common; and the Chancellor's pages made way for me with new-born deference. "There is for country wits!" I heard Baldwin Moor cry gleefully, while the man who put food before me murmured of "the Cludde bull-pup!" If I read in Father Carey's face, as indeed I did, solicitude as well as relief and gladness, I marked the latter only, and hugged a natural pride to my breast. When Martin Luther said boldly, that it was not only Bishop could fill a bowl, it was by an effort I refrained from joining in the laugh which followed.

For an hour I enjoyed this triumph, and did all but brag of it. Especially I wished Petronilla had witnessed it. At the end of that time—*Finis* as the books say. I was crossing the courtyard, one-half of which was bathed in a cold splendour of moonlight, and was feeling the first sobering touch of the night air on my brow, when I heard some one call out my name. I turned, to find one of the Chancellor's servants, a sleek, substantial fellow, with a smug mouth, at my elbow.

"What is it?" I said.

"I am bidden to fetch you at once, Master Cludde," he answered, a gleam of sly malice peeping through the gravity of his demeanour. "The Chancellor would see you in his room, young sir."

### CHAPTER II.—IN THE BISHOP'S ROOM.

THE Chancellor was lodged in the great chamber on the southern side of the courtyard, a room which we called the Tapestried Chamber, and in which tradition said that King Henry the Sixth had once slept. It was on the upper

floor, and for this reason free from the damp air which in autumn and winter rose from the moat and hung about the lower range of rooms. It was, besides, of easy access from the hall, a door in the gallery of the latter leading into an anteroom, which again opened into the Tapestried Chamber; while a winding staircase, starting from a dark nook in the main passage of the house, also led to this state apartment, but by another and more private door.

I reached the antechamber with a stout heart in my breast, though a little sobered by my summons, and feeling such a reaction from the heat of a few minutes before as follows a plunge into cold water. In the anteroom I was bidden to wait while the great man's will was taken, which seemed strange to me, then unused to the mummery of Court folk. But before I had time to feel much surprise, the inner door was opened, and I was told to enter.

The great room, which I had seldom seen in use, had now an appearance quite new to me. A dull red fire was glowing comfortably on the hearthstone, before which a posset stool was standing. Near this, seated at a table strewn with a profusion of papers and documents, was a secretary writing busily. The great oaken bedstead, with its nodding tester, lay in a background of shadows, which played about the figures broidered on the hangings, or were lost in the darkness of the corners; while nearer the fire, in the light cast by the sconces fixed above the hearth, lay part of the Chancellor's equipment. The fur rugs and cloak of sable, the saddle-bags, the despatch-boxes, and the silver chafing-dish, gave an air of comfort to this part of the room. Walking up and down in the midst of these, dictating a sentence at every other turn, was Stephen Gardiner.

As I entered the clerk looked up, holding his pen suspended. His master, by a quick nod, ordered him to proceed. Then, signalling to me in a like silent fashion his command that I should stand by the hearth, the Bishop resumed his task of composition.

For some minutes my interest in the man, whom I had now an opportunity of scrutinising unmarked and at my leisure, took up all my attention. He was at this time close on seventy, but looked, being still tall and stout, full ten years younger. His face, square and sallow, was indeed wrinkled and lined; his eyes lay deep in his head, his shoulders were beginning to bend, the nape of his neck to become prominent. He had lost an inch of his full height. But his eyes still shone brightly, nor did any trace of weakness mar the stern character of his mouth, or the crafty wisdom of his brow. The face was the face of a man austere, determined, perhaps cruel; of a man who could both think and act.

My curiosity somewhat satisfied, I had leisure, first to wonder why I had been sent for, and then to admire the prodigious number of books and papers which lay about, more, indeed, than I had ever seen together in my life. From this I passed to listening, idly at first, and with interest afterwards, to the letter which the Chancellor was dictating. It seemed from its tenor to be a letter to some person in authority, and presently one passage attracted my attention, so that I could afterwards recall it word for word.

"I do not think"—the Chancellor pronounced, speaking in a sonorous voice, and the measured tone of one whose thoughts lie perfectly arranged in his head—"that the Duchess Katherine will venture to take the step suggested as possible. Yet Clarence's report may be of moment. Let the house therefore be watched if anything savouring of flight be marked, and take notice whether there be a vessel in the Pool adapted to her purpose. A vessel trading to Dunquerque would be most likely. Leave her husband till I return, when I will deal with him roundly."

I missed what followed. It was upon another subject, and my thoughts lagged behind, being wholly taken up with the Duchess Katherine and her fortunes. I wondered who she was, young or old, and what this step could be she was said to meditate, and what the jargon about the Pool and Dunquerque meant. I was still thinking of this when I was aroused by an abrupt silence, and looking up found that the Chancellor was bending over the papers on the table. The secretary was leaving the room.

As the door closed behind him, Gardiner rose from his stooping posture and came slowly towards me, a roll of papers in his hand. "Now," he said tranquilly, seating himself in an elbow-chair which stood in front of the hearth, "I will dispose of your business, Master Cludde."

He paused, looking at me in a shrewd, masterful way, much as if—I thought at the time, little knowing how near the truth my fancy went—I were a beast he was about to buy; and then he went on. "I have sent for you, Master Francis," he said dryly, fixing his piercing eyes on mine, "because I think that this country does not suit your health. You conform, but you conform with a bad grace, and England is no longer the place for such. You incite the commonalty against the Queen's allies, and England is not the place for such. Do not contradict me; I have heard you myself. Then," he continued, grimly thrusting out his jaw in a sour smile, "you misname those whom the Queen honours; and were Dr. Stephens—you take me, Master Malapert?—such a man as his predecessors, you would rue the word. For a trifle scarce weightier Wolsey threw a man to rot six years in a dungeon, boy!"

I changed colour, yet not so much in fear—though it were vain to say I did not tremble—as in confusion. I had called him Dr. Stephens indeed, but it had been to Petronilla only. I stood, not knowing what to say, until he, after lingering on his last words to enjoy my misery, resumed his subject. "That is one good and sufficient reason—mind you, sufficient, boy—why England is no place for you. For another, the Cluddes have always been soldiers; and you—though readier-witted than some, which comes of your Spanish grandmother—are quicker with a word than a thought, and a blow than either. Of which afterwards. Well, England is going to be no place for soldiers. Please God, we have finished with wars at home. A woman's reign should be a reign of peace."

I hardened my heart at that. A reign of peace, forsooth, when the week before we had heard of a bishop burned at Gloucester! I hardened my heart. I would not be frightened, though I knew his power, and knew how men in those days misused power. I would put a bold face on the matter.

He had not done with me yet, however. "One more reason I have," he continued, stopping me as I was about to speak, "for saying that England will not suit your health, Master Cludde. It is that I do not want you here. Abroad, you may be of use to me, and at the same time carve out your own fortune. You have courage, and can use a sword, I hear. You understand—and it is a rare gift with Englishmen—some Spanish, which I suppose your father or your uncle taught you. You can—so Father Carey says—construe a Latin sentence if it be not too difficult. You are scarcely twenty, and you will have me for your patron. Why, were I you, boy, with your age and your chances, I would die Prince or Pope! Ay, I would!" He stopped speaking, his eyes on fire. Nay, a ring of such real feeling flashed out in his last words that, though I distrusted him, though old prejudices warned me against him, and, at heart a Protestant, I shuddered at things I had heard of him, the longing to see the world and have adventures seized upon me. Yet I did not speak at once. He had told me that my tongue outran my thoughts, and I stood silent until he asked me curtly, "Well, sirrah, what do you say?"

"I say, my Lord Bishop," I replied respectfully, "that the prospect you hold out to me would tempt me were I a younger son, or without those ties of gratitude which hold me to my uncle. But, my father excepted, I am Sir Anthony's only heir."

"Ah, your father!" he said contemptuously. "You do well to remind me of him, for I see you are forgetting the first part of my speech in thinking of the last! Should I have promised first and threatened later? You would fain, I expect, stay here and woo Mistress Petronilla? Do I touch you there? You think to marry the maid and be master of Coton End in God's good time, do you? Then listen, Francis Cludde. Neither one nor the other, neither maid nor meadow, will be yours should you stay here till Domesday!"

I started, and stood glowering on him, speechless with anger and astonishment.

"You do not know who you are!" he continued, leaning forward with a sudden movement, and speaking with one claw-like finger extended, and a malevolent gleam in his eyes. "You called me a nameless child a while ago, and so I was; yet have I risen to be ruler of England, Master Cludde! But you—I will tell you which of us is base-born. I will tell you who and what your father, Ferdinand Cludde, was. He was, nay, he is, my tool, spy, jackal! Do you understand, boy? Your father is one of the band of foul creatures to whom such as I, base-born though I be, fling the scraps from their table! He is the vilest of the vile men who do my dirty work, my lad."

He had raised his voice and hand in passion, real or assumed. He dropped them as I sprang forward. "You lie!" I cried, trembling all over.

"Easy! easy!" he said. He stopped me where I was by a gesture of stern command. "Think!" he continued, calmly and weightily. "Has any one ever spoken to you of your father since the day seven years ago when you came here, a child, brought by a servant? Has Sir Anthony talked of him? Has any servant named his name to you? Think, boy. If Ferdinand Cludde be a father to be proud of, why does his brother make naught of him?"

"He is a Protestant," I said faintly. Faintly, because I had asked myself this very question not once but often. Sir Anthony so seldom mentioned my father that I had thought it strange myself. I had thought it strange, too, that the servants, who must well remember Ferdinand Cludde, never talked to me about him. Hitherto I had always been satisfied to answer, "He is a Protestant;" but face to face with this terrible old man, and his pitiless charge, the words came but faintly from my lips.

"A Protestant," he replied solemnly. "Yes, this comes of schism, that villains cloak themselves in it, and parade for true men. A Protestant you call him, boy? He has been that, ay, and all things to all men; and he has betrayed all things and all men. He was in the great Cardinal's confidence, and forsook him, when he fell, for Cromwell. Thomas Cromwell, although they were of the same persuasion, he betrayed to me. I have here, here!"—and he struck the letters in his hand a scornful blow—"the offer he made to me, and his terms. Then eight years back, when the late King Edward came to the throne, I too fell on evil days, and Master Cludde abandoned me for my Lord Hertford, but did me no great harm. But he did something which blasted him—blasted him at last."

He paused. Had the fire died down, or was it only in my imagination that the shadows thickened round the bed behind him, and closed in more nearly on us, leaving his pale grim face to confront me—his face, which seemed the paler and grimmer, the more saturnine and all-mastering, for the dark frame which set it off?

"He did this," he continued slowly, "which came to light and blasted him. He asked, as the price of his service in betraying me, his brother's estate."

"Impossible!" I stammered. "Why, Sir Anthony——"

"What of Sir Anthony, you would ask?" the Chancellor replied, interrupting me with savage irony. "Oh, he was a Papist! an obstinate Papist! He might go hang—or to Warwick Gaol!"

"Nay, but this at least, my lord, is false!" I cried. "Palpably false! If my father had so betrayed his own flesh and blood, should I be here? Should I be at Coton End? You say this happened eight years ago. Seven years ago I came here. Would Sir Anthony——"

"There are fools everywhere," the old man sneered. "When my Lord Hertford refused your father's suit, Ferdinand began—it is his nature—to plot against him. He was found out, and execrated by all—for he had been false to all—he

fled for his life. He left you behind, and a servant brought you to Coton End, where Sir Anthony took you in."

I covered my face. Alas! I believed him, I, who had always been so proud of my lineage, so proud of the brave traditions of the house and its honour, so proud of Coton End and all that belonged to it! Now, if this were true, I could never again take pleasure in one or the other. I was the son of a man branded as a turncoat and an informer, of one who was the worst of traitors! I sank down on the settle behind me and hid my face. Another might have thought less of the blow, or, with greater knowledge of the world, might have made light of it as a thing not touching himself. But on me, young as I was, and proud, and as yet tender, and having done nothing myself, it fell with crushing force.

It was years since I had seen my father, and I could not stand forth loyally and fight his battle as a son his father's friend and familiar for years might have fought it. On the contrary, there was so much which seemed mysterious in my past life, so much that bore out the Chancellor's accusation, that I felt a dread of its truth even before I had proof. Yet I would have proof. "Show me the letters!" I said harshly; "show me the letters, my lord!"

"You know your father's handwriting?"

"I do."

I knew it, not from any correspondence my father had held with me, but because I had more than once examined with natural curiosity the wrappers of the despatches which at intervals of many months, sometimes of a year, came from him to Sir Anthony. I had never known anything of the contents of the letters, all that fell to my share being certain formal messages, which Sir Anthony would give me, generally with a clouded brow and a testy manner that grew genial again only with the lapse of time.

Gardiner handed me the letters, and I took them and read one. One was enough. That my father! Alas! alas! No wonder that I turned my face to the wall, shivering as with the ague, and that all about me—except the red glow of the fire, which burned into my brain—seemed darkness! I had lost the thing I valued most. I had lost at a blow everything of which I was proud. The treachery that could flush that worn face opposite to me, lined as it was with statecraft, and betray the wily tongue into passion, seemed to me, young and impulsive, a thing so vile as to brand a man's children through generations.

Therefore I hid my face in the corner of the settle, while the Chancellor gazed at me awhile in silence, as one who had made an experiment might watch the result.

"You see now, my friend," he said at last, almost gently, "that you may be base-born in more ways than one. But be of good cheer; you are young, and what I have done you may do. Think of Thomas Cromwell—his father was naught. Think of the old Cardinal—my master. Think of the Duke of Suffolk—Charles Brandon, I mean. He was a plain gentleman, yet he married a queen. More, the door which they had to open for themselves I will open for you—only, when you are inside, play the man, and be faithful."

"What would you have me do?" I whispered hoarsely.

"I would have you do this," he answered. "There are great things brewing in the Netherlands, boy—great changes, unless I am mistaken. I have need of an agent there, a man stout, trusty, and, in particular, unknown, who will keep me informed of events. If you will be that agent, I can procure for you—and not appear in the matter myself—a post of pay and honour in the Regent's Guards. What say you to that, Master Cludde? A few weeks, and you will be making history, and Coton End will seem a mean place to you. Now what do you say?"

I was longing to be away and alone with my misery, but I forced myself to reply patiently.

"With your leave I will give you my answer to-morrow, my lord," I said, as steadily as I could; and I rose, still keeping my face turned from him.

"Very well," he replied, with apparent confidence. But he watched me keenly, as I fancied. "I know already what your answer will be. Yet before you go I will give you a piece of advice which in the new life you begin to-night will avail you more than silver, more than gold—ay, more than steel, Master Francis. It is this: Be prompt to think, be prompt to strike, be slow to speak! Mark it well! It is a simple recipe, yet it has made me what I am, and may make you greater. Now go!"

He pointed to the little door opening on the staircase, and I bowed and went out, closing it carefully behind me. On the stairs, moving blindly in the dark, I fell over some one who lay sleeping there, and who clutched at my leg. I shook him off, however, with an exclamation of rage, and, stumbling down the rest of the steps, gained the open air. Excited and feverish, I shrank with aversion from the confinement of my room, and, hurrying over the drawbridge, sought at random the long terrace by the fish-pools, on which the moonlight fell, a sheet of silver, broken only by the sundial and the shadows of the rose-bushes. The night air sweeping chill from the forest fanned my cheeks as I paced up and down. One way I had before me the manor house—the steep gable-ends, the gateway tower, the low outbuildings and cornstacks and stables—and flanking these the squat tower and nave of the church. I turned. Now I saw only the water and the dark line of trees which fringed the further bank. But above these the stars were shining.

Yet in my mind there was no starlight. There all was a blurr of wild passions and resolves. Shame and an angry resentment against those who had kept me so long in ignorance—even against Sir Anthony—were my uppermost feelings. I smarted under the thought that I had been living on his charity. I remembered many a time when I had taken much on myself, and he had smiled, and the remembrance stung me. I longed to assert myself and do something to wipe off the stain.

But should I accept the Bishop's offer? It

never crossed my mind to do so. He had humiliated me, and I hated him for it. Longing to cut myself off from my old life, I could not support a patron who would know, and might cast in my teeth the old shame. A third reason, too, worked powerfully with me as I became cooler. This was the conviction that, apart from the glitter which the old man's craft had cast about it, the part he would have me play was that of a spy—an informer! A creature like—I dared not say like my father, yet I had him in my mind. And from this, from the barest suspicion of this, I shrank as the burned puppy from the fire—shrank with fierce twitching of nerve and sinew.

Yet if I would not accept his offer, it was clear I must fend for myself. His threats meant as much as that, and I smiled sternly as I found necessity at one with inclination. I would leave Coton End at once, and henceforth I would fight for my own hand. I would have no name until I had made for myself a new one.

This resolve formed, I turned and went back to the house, and felt my way to my own chamber. The moonlight poured through the lattice and fell white on my pallet. I crossed the room and stood still. Down the middle of the coverlet—or my eyes deceived me—lay a dark line.

I stooped mechanically to see what this was, and found my own sword lying there; the sword which Sir Anthony had given me on my last birthday. But how had it come there? As I took it up something soft and light brushed my hand and drooped from the hilt. Then I remembered. A week before I had begged Petronilla to make me a sword-knot of blue velvet for use on state occasions. No doubt she had done it, and had brought the sword back this evening and laid it there in token of peace.

I sat down on my bed, and softer and kindlier thoughts came to me; thoughts of love and gratitude, in which the old man who had been a second father to me had part. I would go as I had resolved, but I would return to them when I had done a thing worth doing: something which should efface the brand that lay on me now.

With gentle fingers I disengaged the velvet knot and thrust it into my bosom. Then I tied about the hilt the old leather thong, and began to make my preparations; considering this or that route while I hunted for my dagger and changed my doublet and hose for stouter raiment and long untanned boots. I was yet in the midst of this, when a knock at the door startled me.

"Who is there?" I asked, standing erect.

For answer Martin Luther slid in, closing the door behind him. The fool did not speak, but turning his eyes first on one thing and then on another nodded sagely.

"Well?" I growled.

"You are off, master," he said nodding again. "I thought so."

"Why did you think so?" I retorted impatiently.

"It is time for the young birds to fly when the cuckoo begins to stir," he answered.

I understood him dimly and in part. "You have been listening," I said wrathfully, my cheeks burning.

"And been kicked in the face like a fool for my pains," he answered. "Ah, well, it is better to be kicked by the boot you love than kissed by the lips you hate. But Master Francis, Master Francis!" he continued in a whisper.

He said no more, and I looked up. The man was stooping slightly forward, his pale face thrust out. There was a strange gleam in his eyes, and his teeth grinned in the moonlight. Thrice he drew his finger across his lean knotted throat. "Shall I?" he hissed, his hot breath reaching me—"shall I?"

I recoiled from him shuddering. It was a ghastly pantomime, and it seemed to me that I saw madness in his eyes. "In Heaven's name, no!" I cried—"No! Do you hear, Martin? No!"

He stood back on the instant, as a dog might have done being reproved. But I could hardly finish in comfort after that with him standing there, although when I next turned to him he seemed half asleep and his eyes were dull and fishy as ever.

"One thing you can do," I said brusquely. Then I hesitated, looking round me. I wished to send something to Petronilla, some word, some keepsake. But I had nothing that would serve a maid's purpose, and could think of nothing until my eye lit on a house-martin's nest, lying where I had cast it on the window-sill. I had taken it down that morning because the droppings during the last summer had fallen on the lead work, and I would not have it used when the swallows returned. It was but a bit of clay, and yet it would serve. She would guess its meaning.

I gave it into his hands. "Take this," I said, "and give it privately to Mistress Petronilla. Privately, you understand. And say nothing to any one, or the Bishop will flay your back, Martin."

# EVERY-DAY LIFE ON THE RAILROAD.

## THE TIME-TABLE.

IN this island of Great Britain there are over 17,000 miles of railroad; and on these 17,000 odd miles there are carried in the course of a single year nearly 300 million tons of minerals and merchandise, and a number of passengers equal to half the population of the earth. To carry these passengers and goods there are some 34,500 carriages, and over half-a-million other vehicles, dragged by 15,000 engines, which together travel in the course of the year about 290 million miles, or more than three times the distance from the earth to the sun.

The handling of this enormous mileage with the minimum of accident is an ordinary achievement of which we make but little boast, regarding it as hardly worth notice. But nothing like it was known before, and the Roman with all his roads would have looked upon it with amazement.

This mention of the Roman suggests a common allusion we may as well deal with as we go. How often we hear of the roads of the past as better than those of to-day! "Why," say the antiquarians, "cannot you make as good a road as the Romans?" Even admitting the very doubtful inferiority, the answer is complete. The roads of our age are the railroads. It is by them that the traffic of the country goes; our parish roads are but their auxiliaries. The comparison should not be between Roman roads and parish roads, but between Roman roads and railroads. And nowhere in the present or the past can there be found a better road than an English railway line, running at easy gradients through hill and over valley, and perfect in construction in every inch of its course. A comparison of the Appian Way with the London and North-Western, of the roads in Gaul with the competing lines through Cumberland, is certainly not to the advantage of the ancients, wonderful as their work was, considering the conditions with which they had to deal. As in all things else, the modern holds the field. Even the Pyramids of Egypt could be surpassed, if the way was clear for a dividend.

And this brings us to the money question. To make and work our 17,000 miles of line there has been invested as capital close on 840 millions of pounds, a sum exceeding our National Debt by 150 million pounds! If ever the Government become possessed of the railways, as many people hope, a nice little amount will be required. 840 million pounds, whether alive or dead, is not the sort of thing the British taxpayer would care to part with in a hurry. At $4\frac{1}{4}$ per cent.—the present average railway dividend—the profits would, of course, help considerably to pay consols interest at $2\frac{3}{4}$; but the magnitude of the financial operation will keep it for some time beyond the range of practical politics, and the longer it is so kept, the nearer the arrival of the means of locomotion to which the railways will in their turn give place.

But we can leave the future to take care of itself. This is the railway age. The work done on the line has an interest for every member of the nation. It exercises a powerful influence on the food we eat, the clothes we wear, the houses we live in, the streets we tread, and the thoughts we think.

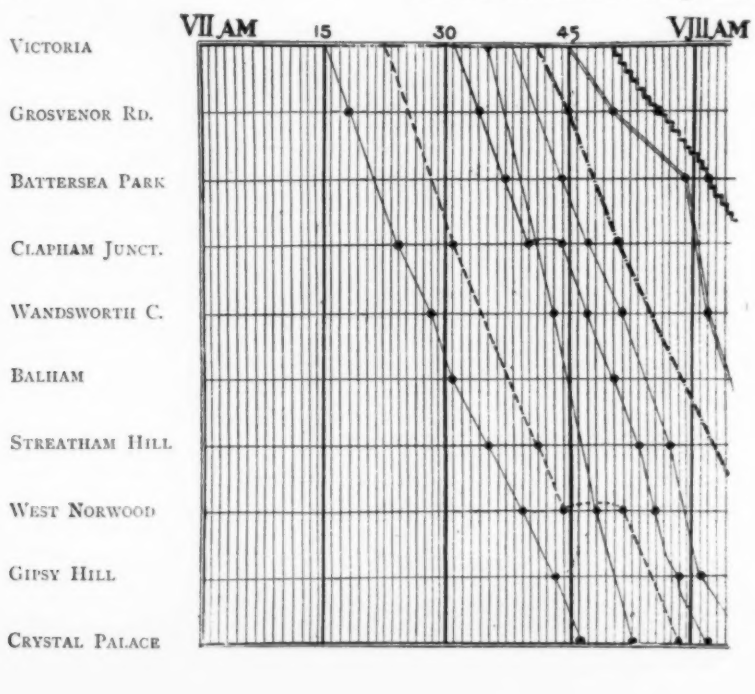
Taking personal travel first, we find that, on an average, every man, woman, and child in Great Britain takes a railway journey every fortnight. How the millions tell up! In the course of a year the Great Eastern Company conveys $75\frac{1}{2}$ millions of passengers; the Metropolitan carries 71 millions,

the London and North-Western 59 millions, the Great Western 55, the Lancashire and Yorkshire 43, the Brighton 40, the North-Eastern 38, the London and South-Western 37, the Midland 36, the District 34, and the Great Northern, North London, Chatham, and South-Eastern each 28. These are the fourteen chief passenger lines, and among them they account for 600 million travellers.

To estimate the weight of the people is a trifling task we leave to others; compared to the weight of the goods and minerals it is insignificant. In a year the North-Eastern carries 41½ million tons of minerals and ordinary goods, the London and North-Western carries 37½ million tons, the Midland 29, the Great Western 26, the Lancashire and Yorkshire 17, the Great Northern 12; and thus our six largest carriers account for 163 million tons.

The distances these weights are carried are as remarkable. In this island there are five companies with over a thousand miles of railroad apiece. Of these the Great Western trains run 33 million miles on 2,477 miles of line, the North-Western run 40 million on 1,876 miles of line, the North-Eastern run 25½ million on 1,599 miles of line, the Midland run 37½ million on 1,375 miles of line, and the Great Eastern run 16½ million on 1,100 miles of line.

But enough of big figures. Suffice it to say that curiously enough the 17,000 miles of line are traversed 17,000 times in a year, the total mileage amounting to 289,000,000. In other words, there is the equivalent of a train every half hour day and night on every mile of line.



How is it that in so small an area as our railway system 300 million tons can be run hither and thither for nearly as many million miles without frequent disaster? How is it that this huge traffic is carried on with so little danger, that it is actually safer to ride in a railway carriage than to walk to a railway station?

The answer is "Time!" By the time-table the trains come on to the line at workable intervals, and by the time-table they more or less punctually come off it. The signalmen take them in hand as they run, and secure them a safe position, but the main cause of their safety throughout is their keeping time. Would they could keep it better and eliminate accident altogether!

Who made the first railway time-table is not clear. In the early days of railway history, the tables were way-bills like those of the coaches, one bill for each train. The arrangement in columns came in tentatively and gradually, but its originator is undiscoverable. For many years it was the only method adopted both before and behind the railway scenes; but now a diagram system has been introduced for the use of the officials, which some day may even come before the public. The advantages are great. Though somewhat complicated at first sight, it is clearness itself when understood. Let us give a few minutes to this diagram, and have a little practice in "stringing the trains," just by way of making the modern method intelligible.

Let us pin a sheet of paper on to a drawing-board: and, leaving a margin, divide it into twenty-four equal parts. Through the divisions we draw parallel vertical lines, and have thus a vertical space for every hour of the day. Let us further divide each space into half hours, quarter hours, five-minute intervals, and even minute intervals, if our paper will permit us; and let us number our first lines from midnight to noon, and on to midnight again, so as to have what by joining the right and left edges would be a cylindrical clock face.

Now let us divide our marginal line into just as many spaces as there are miles in the line over which we intend to run our trains; and at the proper points on this vertical scale let us write the names of the stations through which our train will

pass. We have thus a vertical scale of distance, and a horizontal scale of time.

As our example, let us take the trains from Victoria to the Crystal Palace. The first starts at a quarter past seven in the morning. Where the horizontal line from Victoria crosses the vertical line from 7.15 we insert a pin; at 7.18, where the line from Grosvenor Road crosses the time line, we insert another pin; as the train does not stop at Battersea Park our next pin will be at 7.24 at Clapham Junction; our next at 7.28 will be at Wandsworth Common; our next at 7.31 at Balham; our next at 7.35 at Streatham Hill; our next at 7.39 at West Norwood; our next at 7.43 at Gipsy Hill; our next at 7.46 at Crystal Palace. Now let us join all our pins by a coloured thread, and let us mark out all the trains of the day on the same plan.

When the trains do not stop at a station the threads will cross the line at the time the trains run through. The ordinary passenger working is thus shown at a glance. Let us plot out the mineral trains in the same way with another coloured thread; let us show the goods trains in the same way with another coloured thread; if there are any "foreign" trains from other lines, or any special goods trains, such as fish trains, etc., we mark them with a different-coloured thread; and so on until the complete day's traffic passing over the down line is shown. If a train has to wait for some minutes at a station, two pins will be used and the thread will be straight between them. Having the trains on the road throughout the day thus displayed, it is obvious that the position a special train or excursion train can be made to occupy is at once discoverable. If a train is to be accelerated or slowed, a shifting of the pins will show how it can be done. If it is to pass another at any station, it must be so arranged as to pass through where the thread from pin to pin is horizontal.

By "stringing the trains" the risk of collision is minimised; until the device was hit upon, dependence had to be placed on figures: now it is placed on diagram, and mistakes are immediately apparent. Some years ago there was a man at a certain terminus who knew the position of every train at every moment at every point of the line. "Where is the 3.30 now?" we would ask. "The 3.30, sir, is now just passing the two oaks on the left-hand side of the White Horse cutting—or rather, it ought to be if all is well." The man was a wonder. He made it his business to master this curious problem of localisation. He was a walking Bradshaw, and something more; but now his feats of memory are easily acquired by means of the board and strings, or rather two boards, for as a rule there is one board for the down traffic and one for the up, each board being about four feet long by half as wide.

The making of a railway time-table is, however, no easy matter. In the winter the goods traffic is heavy and the passenger traffic light; in the summer the goods traffic is light and the passenger traffic heavy; hence it is that the chief alterations are made in spring and autumn. But every month of the year there are changes in both goods and passenger running, and a change in the time of even a single train may mean dozens of changes in the time of connecting trains it communicates with on its course. "A train service," as Colonel Findlay says, "is like a house of cards: if the bottom card is interfered with, the whole edifice is disarranged and has to be built up afresh. Remembering all this, and the pressure under which the work must be done, the wonder is not so much that an occasional error creeps into a time-table as that such marvellous accuracy is, on the whole, arrived at."

There are many things to be thought of. To begin with, the trains must be equal to the traffic, and they must not only be got away from the terminus but brought back again within reasonable hours. As the conditions change, the alterations are made according to suggestions from the staff or outsiders, and the result we see in the difference between a time-table of to-day and one, say, of ten years since.

On many of the lines a report is drawn up setting forth the trains it is proposed to alter, or to abolish, or to add. This is submitted to the general manager and then to the directors, for the change of a train on one line may mean the change of many on friendly or rival lines, and thus have an important bearing on railway policy. After the report is considered, the alterations authorised are made in a copy of the current tables, and all the times at all the stations affected are carefully examined and checked so that none of the existing working is thrown out of gear. The type of railway tables is always kept standing, and when the printers receive the copy for the coming month, all they have to do is to make the corrections. After passing a very careful routine of official revision, the proofs are dismissed and the copies struck off.

The variety of tables used by a great line is considerable. There are first the sheet tables. These are the tables that ought to be among the most prominent decorations of railway station walls, if only the advertising fever would leave us in peace. As it is, they have to be picked out from a mass of very miscellaneous matter, and are generally placed in such badly-lighted positions that a match has to be used at night to read them by. Another peculiarity of these tables is that they are seldom found on the outside of country stations; the would-be passenger arriving before the station is opened being generally unable to ascertain when business will begin owing to the table being exhibited either in the locked booking-office or on the inaccessible platform. Surely on a railway where so much depends on time, the easiest thing to find inside and outside should be the time-table.

Besides the sheets there are the books which all the chief companies have on sale. The Midland print some 40,000 copies of theirs, which are sold to the public at a penny, though they cost nearly fourpence. All companies lose money in the same way, more or less, but the loss on the book is a working expense which cannot well be abolished. These books and sheets are the authorities for the private guides and local tables, of which there are so many in the market. As soon as the proofs are passed for press, duplicates are sent off to Brad-

shaw and others, and these people make their corrections, and start printing a few hours after the official printers, so as to be ready on the first of the month. In return for the proofs the first copies of the guide are usually sent to the railway company, and in some cases as a matter of favour these are looked over and attention called to mistakes. But this is in no case done as a matter of right, it is simply considered to be worth the time, to save from annoyance such of the public as prefer the local guide to the official time-book.

On the North-Western the time-tables are discussed at the Officers' Conference in the third week of every month, and the changes are then ordered. To revise the existing tables, there then proceed to the printers at Newton-le-Willows a "time-table clerk" from each of the ten districts into which the line is divided, and a representative of the Superintendent of the Line to supervise their labours. Each of the clerks writes out the times for his own section, and when these are all settled, the proofs are corrected on the spot, so as to avoid delay in transmission.

But let it not be supposed that the sheets and cards and the penny or twopenny time-tables of the passenger service are the only ones required. Besides these there is the "working time-table" for the use of the company's men, which, on a "heavy" line, forms a good-sized volume of three or four hundred pages. In it are given not only the times of running the mineral and merchandise trains, and the stations at which the waiting and shunting are to be done; but also the times of every train on the line, at every station it stops, and every principal station it passes through without a stop. This is *the* time-table to look at. If the judge were correct in ascribing lunacy to any man who studies Bradshaw for twenty consecutive minutes, the men who work our railways must be in a bad way indeed. Here are all the details, up and down, of the newspaper trains, the mail trains, the expresses, the fasts, the stopping trains, the local trains, the express goods, the stopping goods, the coal trains, and trains unclassified: all duly set forth so that every man concerned in the working of each train must read and learn what his share in that working is to be. Special trains decided upon during the month have, if time permit, special leaflets to be added to this bulky time-table; and if the Queen should come, there will be an extra pamphlet of half-a-dozen closely printed pages, giving the time of the royal train past every signal box from end to end of the road on which it runs.

This royal train would be the finest train in the world if it would only go a little faster. But while ordinary people are in these days carried to the north at a speed of fifty miles and more an hour, the Queen is content to jog along at an old-fashioned thirty-six. Were it not for the "stringing" the interruption to traffic caused by this leisurely progress would be serious. A pilot engine runs a quarter of an hour in front of the train to make sure of a clear line. For half an hour before the train passes a signal box, no engine or vehicle is allowed on the section of the line under the signalman's control. For half an hour no train can cross that section of line, nor can any shunting take place on the lines adjoining it. And after the train has passed nothing is allowed to follow for a quarter of an hour. Further, on the lines alongside, no engines or trains except passenger trains are allowed to travel between any two signal boxes from the time the pilot is due until the train has passed. Every station and crossing is guarded to keep trespassers off the line. All the facing points are bolted so that the train cannot run on to the wrong line; all level crossing gates, when there are no gatekeepers, are locked an hour before the train is due; all along the line platelayers are on the watch to keep the road clear, and on the train itself there are fitters, lampmen, and greasers, alert for any eventuality. No wonder that the working of a train like this requires a pamphlet to itself.

With the gold-printed time-table prepared for the Queen there is given a card showing the gradients of the road. If this were done with other time-tables, many of the mysteries of travel would be made plain. Great is the effect of gradient on velocity; a rise of only 1 in 224 requiring twice the engine power that the level does. The object of the surveyor is to secure a level road, and consequently the older the road the more level it is. It is the newer road which is hilly and picturesque. The Great Northern road to Scotland is fairly level: so to a less extent is the North-Western; but the picturesque Midland is far more up and down, and the engine power used in accomplishing the distance in anything like the time of its rivals is necessarily great; in fact, there is no better work done in the railway world than by the Midland Scotch expresses. During the railway race to Edinburgh the most amusing feature was the crowd of old ladies placidly taking their seats at St. Pancras, congratulating themselves on having avoided the wild antics of the Northern Scotchman and Flying Nor'-Wester. "So dangerous, you know, with their sixty miles an hour." The sixty miles having been fled from, in order that the timid ones might all unknowingly be dragged up the banks of the Waverley route at a laborious forty, and bustled down them at an exhilarating seventy-five. It was indeed a case of ignorance being bliss, particularly about Beattock.

On a straight and level line punctuality is easy; but on a curved and hilly one the difficulties increase rapidly. The effect of a gradient on a train is nowhere more clearly shown than at the Hopton incline on the High Peak Railway, where there is a gradient a quarter of a mile long rising 1 in 14. Up this an engine is just able to draw its own weight of load, and no more. Increase the load ever so little, or let the rails be slippery, and locomotion there is none. This is an extreme instance, but a clear example. Sudden changes of weather, and unexpected rushes of passengers and luggage, make but little difference on the dead level; it is on the "banks" that the engine feels them, and minute after minute is lost.

But the time is made up on the down grade! That is difficult. Let us work out a little sum together. A train travelling sixty miles an hour has to slow to thirty miles an hour in ascending an

incline, say, ten miles long. On the flat she would have accomplished the ten miles in ten minutes; but as she has to slow to half speed, it takes her just double that time to reach the summit, and consequently she loses ten minutes by the ascent. How can she regain this? Take her down the incline at the terrific rate of even ninety miles an hour, and yet she will fail to make it all up. For at ninety miles an hour it will take her forty seconds to do each mile, or six minutes forty seconds to do the ten miles, which on the level she would have done in ten minutes. She therefore loses ten minutes on the ascent, and gains only three minutes twenty seconds on the descent, and thus the gradient means a loss of six minutes forty seconds. In nothing is the value of lost minutes more apparent than in railway working.

To keep the loss at a minimum, the margin of power in an engine has to be a wide one. A rise of 1 in 112 trebles an engine's work; one of 1 in 75 quadruples it; one of 1 in 56 multiplies it five times. If an engine requires 150 horse-power to drag a train along the level, it will have to develop 900 horse-power to drag the same train up an incline of 1 in 45. The sharper the rise, the sooner is felt the effect of a slippery way or an increased load. In this we have the reason of the constantly varying speed at which our long-journey trains are driven, and the reason why between any three stations, at equal distances, the time of the journey differs.

As the engine has a margin of power, so the time-table allows the train a margin of time; but it is obvious that this cannot be very wide without disorganising the traffic throughout the line. Even were trains to be worked entirely by signal, they would still have to start and arrive at definite hours.

The drawing up of the time-table is consequently not the easy matter it would at first sight seem to be. The state of the trade, the state of the road, the state of the steam-power, and a hundred other things, have to be taken into consideration, and the result is a compromise.

Sometimes there is a vested interest which has to be respected, and acts as a worse retarder than even a high gradient. Take Swindon, for instance. When the Great Western opened, it was supposed that as a man was hungry after travelling seventy-seven miles by coach, so would he be hungry after seventy-seven miles by train. The difference in the time of the journey was forgotten by the maker of the time-table, and the Swindon stop then introduced, with the ninety-nine years' lease of the rooms, is now the great obstacle to improvement in the Great Western running—so the Great Western people say. A similar mistake was made at Wolverton on the North-Western, but there, in the absence of a lease, a clearance was effected as soon as the traffic required it. At Wolverton the passengers from Birmingham to London were expected to dine, but the passengers discovered to their astonishment that they were never so hungry as they expected to be, and the Wolverton meal lost patronage. Nowadays, passengers dine at much longer radii, not at Swindon and Wolverton, but at Preston, and Normanton, and Doncaster—that is, if they do not take their meals on the journey in the dining car—and the stop at Wolverton is as much a thing of the past as that at Newton on the Liverpool and Manchester, where all trains were detained ten minutes in order that passengers might "refresh themselves with Eccles cakes"!

W. J. GORDON.

## THE "MONT DE PIÉTÉ" IN PARIS.

### ITS ORIGIN AND ADMINISTRATION.

THAT sombre emporium into which every conceivable article of use or wear, whether valuable or valueless, whether it is the jewelry of the prodigal or the saucepan of the toiler, stealthily seeks admittance, has a name which cannot readily be translated into English and yet retain its meaning, perhaps because the institution has no equivalent either. It has an Italian origin; *il Monte di Pietà* was founded at Perugia in 1462 by the monk Barnabeo di Terni; inexpressibly grieved at the destitution which surrounded him on all sides, the good Father preached a stirring sermon, at the close of which he prevailed upon his audience to open a subscription for a fund to be devoted to loans, at an almost nominal interest, on the deposit of small articles of personal property belonging to the very poor. The first step towards legal pawnbroking was taken; the clergy patronised the undertaking and ensured its existence and future prosperity. In France, Jean Douet de Romp Croissant advocated the adoption of the Mont de Piété as a complement to his system of public assistance; but during the troublous times of Ann of Austria's regency he met with but scant support, and the first Royal Letters Patent providing for a Mont de Piété date only from December 1777. They state that the object of the foundation is to combat usury; to regulate the lending of money on such terms as will make it advantageous to poor borrowers; that the administrators are to be elected by the hospitals, and the valuers of the deposits to be taken from the company of the *Commissaires Priseurs* of the Châtelet of Paris, and that after a lapse of thirteen months the articles not reclaimed shall be sold at public auction, and the produce given to the hospitals.

Since that date, the Mont de Piété has passed through many vicissitudes; but it has weathered even the revolution of '93, the German invasion, the Commune, and is now as flourishing as ever, without any material change having been introduced into its fundamental laws, whatever improvements may have facilitated its working arrangements. The central building is still in the Quartier du Marais, Rue Paradis, the site of its first installation. The whole administration consists of this principal

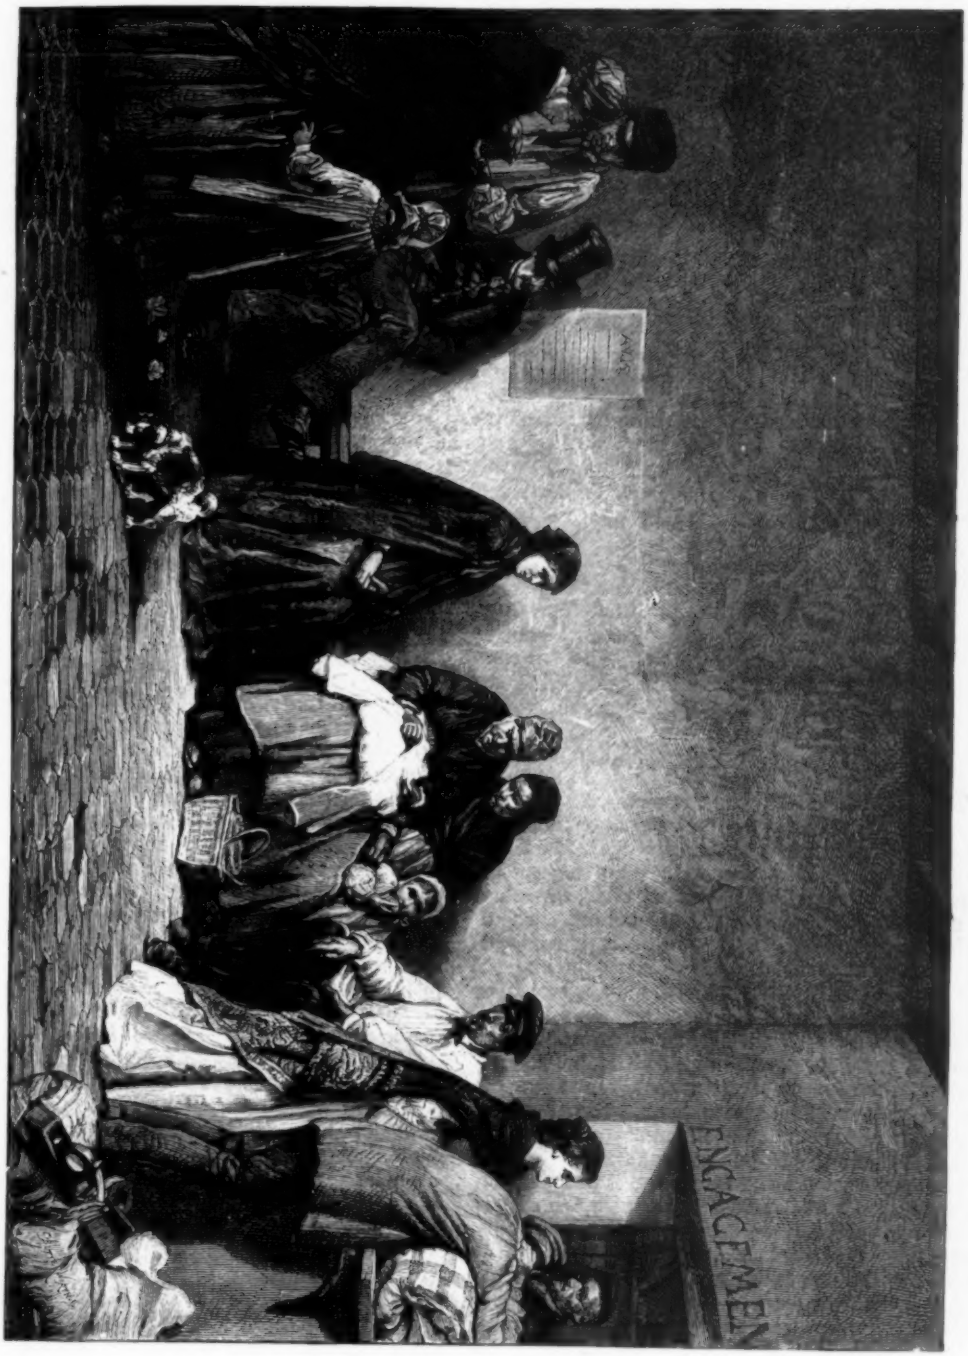
office, with two supplementary additions, twenty-four auxiliary branches, and fourteen Commissioners. The central house has a second entrance upon the Rue des Francs Bourgeois; it is guarded by twenty-five municipal agents, has a fire brigade attached to it, and also a post of police composed of a sergeant and three subordinates. The building was renovated and added to in 1805, but, with its yellow colour and mean architecture, it is inexpressibly ugly, dreary, and grim.

In order to be able to lend money, the Mont de Piété has to borrow it; the regulations binding the hospitals to provide it with funds are never enforced or conformed to, while the profits are faithfully handed over to them. To meet its demands the Mont de Piété proceeds like the Treasury: it issues bonds at twelve, six, or even three months, the interest of which, fixed by Council, varies from 3½ to 5 per cent. During the siege of Paris it was raised to 6 per cent. These bonds are in great credit among small capitalists, who, on an average, bring forty millions of francs to the Mont de Piété, in whom they have an entire confidence. Only the amount necessary to its daily transactions is kept at its bank, the remainder is deposited in the Treasury at an invariable interest of 3 per cent. The holders of these bonds belong almost entirely to the class of greengrocers, fruit and vegetable growers, job-masters, a class of economical and saving tendencies; the loan is in constant demand; not an hour of the day passes but that some individual or other brings to the bank sums varying from 500 to 1,000 francs, in exchange for which he receives an acknowledgment taken from a book with counterfoils which is scrip or bond. The money at once enters into circulation, for the Mont de Piété lends all it borrows on the same simple system; only it borrows on its own responsibility, and lends on the responsibility of the *Commissaires Priseurs* guaranteed by the funds of their company.

### HOW THE PAWNING IS DONE.

To avoid crowding and obstruction, there are two distinct pawning or *engagement* offices called first and second divisions. In the former, jewelry, precious stones, and valuables of small compass are received; in the latter, the motley collection of other pledges styled "parcels." At the furthest end of a yard a narrow passage leads to a gloomy paved hall; two or three wooden benches stand against the walls, a large glazed cage occupies the back space, provided with a wicket so arranged that the lender and borrower cannot see each other's faces. Behind the partition, in the full light of day, the employés are seated around a horse-shoe table. The Commissaire appraiser placed nearest to the window has by him a magnifying glass, a touch-stone, a bottle of nitric acid, and a pair of scales; next to him is a clerk provided with a pile of printed and numbered receipt forms. Two men in striped linen blouses occupying stools near the table are respectively in charge of a lighted gas-jet, sealing-wax, brown paper, innumerable boxes, stout thread and needles. Hovering between the wicket and the table is an official who weighs the deposits, and together they form the contingent necessary to the conclusion of an *engagement*.

In the slang of the place, every one coming to pawn is *a "public"*; he places his article on the board of the wicket, whence it is taken by the weigher and thrown into the scales; its nature, gold or silver, and weight, is announced aloud before it is handed to the appraiser, who counts the precious stones if there are any, tests it, verifies the quality of the metal, and affixes a value, namely a sum which ninety-nine times out of a hundred is accepted without protest. The writing-clerk gives the "public," now become an *engagiste*, a counter bearing the two last figures of the number on the bulletin of registration, on which is stated at length the value and nature of the deposit, also the sum lent on it; it is signed by the appraiser and dropped through a slit into an adjacent room, where it is taken up by three other clerks who make separate and detailed entries into their respective ledgers. If the sum lent does not exceed fifteen francs it is paid out without further formalities; if it does, a receipt is requested and, moreover, a proof of identity or satisfactory reference; if those are not produced the loan is not tendered, but the deposit retained and inquiries instituted.



The bulletin of registration is returned to the first office, where it is compared with the deposit therein described, the latter is then placed in one of the boxes kept in readiness and secured with twine if not valued at more than twenty francs; if above that estimation the box is wrapped in paper, fastened with seals, and stamped with the number of the division and the three letters *M. D. P.* Box and bulletin are passed over to the next man in blouse, who sews one to the other, leaving the number as apparent as possible, and puts them in covered hampers in readiness to be conveyed to the warehouses. Sometimes a "public" requires less than the sum offered on his pledge; in those cases the word *requis* is added on all the papers after the figure of the sum paid.

In the second division for miscellaneous articles the proceedings are similar; some of the articles brought are so valueless that it is out of mere charity that the minimum loan of three francs is awarded. In another portion of the building is the office of the Director, where secret *engagements* can be made. The clients there are of various ranks and classes, mostly people who are morbidly afraid of publicity, and fear to be recognised at the common wicket and their names divulged. The article they offer is sent down to the appraisers, and goes through the same routine, but the pledger's name is written on a special book kept under lock and key, and remains known only to the Director.

### THE STOREROOMS.

The Mont de Piété being responsible for the goods warehoused, its storerooms are under watchful supervision; like the pawning offices, they are in two corresponding divisions. The first, for jewelry and sealed boxes, is on the first floor; they are, as they arrive, inscribed in ledgers of which the colours, white, pink, yellow, and green, vary every year; thus supposing it to be yellow, every paper and document for that year is of the same tint; this is to facilitate researches and identifications. When the inscription is made, the warehouse man carries the deposit

THE MONT DE PIÉTÉ.

(THE GOVERNMENT PAWN-SHOP IN PARIS.)

*(From the picture by Ferdinand Heilbuth.*

to a strange capharnaüm consisting of rows of narrow lanes made by walls of pigeon-holes, and places it in the compartment to which the number of the bulletin corresponds; for greater facility the renewed pledges bear odd, the others even numbers; in the first case the second is carefully sewn over the previous number. Besides these pigeon-holes there are strong iron chests with two keys, one kept by the warehouse custodian, the other by the controller; in these are put away the *four figure* articles, meaning those on which more than a thousand francs have been lent; other safes with a single key receive the deposits valued at five hundred francs. Internally these chests present the appearance of a monstrous almanac, being divided into twelve compartments labelled with the months of the year; then into two more, each representing the fortnights; and these again have three small shelves for five days apiece.

The warehouses for the miscellaneous "parcels" are in a distinct building of three storeys; the packages, which are often large and cumbrous, require a great deal of room. Bedding, of which there are large quantities, is stored under the roof: it especially abounds in the branch offices; in the Rue Servan, for example, there have been warehoused as many as 8,800 mattresses at a time; some depositors bring a dozen at once, probably schoolmasters or lodging-house keepers without pupils or boarders. The lower rooms contain more furniture than any upholsterer's or cabinet-maker's shop; the walls of brick and iron are fireproof. On the ground floor are the carriages and other vehicles, with the heavy iron goods, machines, and a vast number of workmen's tools.

### REDEEMING THE PLEDGES.

The number of deposits averages yearly about 1,800,000, the secret ones only amounting to 4,000. As a rule they remain at the Mont de Piété from seven to eight months, when they are redeemed. The owner presents himself in a large hall, where he is confronted by several wickets, behind each of which are two clerks. His pawn-ticket is received by a controlling official, who calculates the interest per fortnight, except for the first month, which is always charged at six per cent. per annum. He adds three per cent. for keep and "*manutention*," and one per cent. for the Appraising Commissioners, makes up the sum total, and inscribes the figure on the recognisance or pawn bulletin, which he then passes on to his colleague, an employé of the cash office, who has to verify the amount and to collect the money from the depositor, who is now called a *dégagiste*. In exchange for payment, the latter receives a counter with a red or black number according to the division in which his property is stored, and which is in fact a power of discharge. Armed with it he proceeds to the *salle de rendition*, an uninviting apartment provided with forms and over which a policeman watches. Meanwhile the bulletin has been forwarded to the special warehouse designated thereon, the article in question found and delivered to the controller, who verifies that it answers the description and who signs the document. Both are sent up to the *salle de rendition* and given up to the "returning" clerk behind his wicket; he is bound to see that the strings or seals have not been tampered with, and to examine the contents; if they tally with the declaration he stamps the latter with a special seal which stands in lieu of his signature, and the owner is summoned to receive his property.

The time that elapses between the first claiming of the deposit and its delivery is thirty-five minutes, but it has happened as often as five or six times a year that the article released at one wicket by payment has not been waited for at the other, and no explanation has ever been given of this mysterious conduct; those goods are for ever lost to their proprietor, and sold with the unredeemed ones when the moment arrives.

There is a strange fancy for renewing the pledges by paying at the end of the year the interest due; some of the deposits seem fated never to leave the Mont de Piété. One old umbrella had been renewed forty-seven times, when a member of the council of supervision, seeing it always in the same place covered with fresh tickets like scales, took pity on it, paid the expenses, and had it restored to its master, who was incensed at the impertinence of any one daring to offer him alms. A white calico curtain paid for by renewed interest for twenty years was finally sold after having brought in more than seven times its original value. And these are but examples in a thousand.

### THE DAILY AUCTIONS.

The regulations of the Mont de Piété stipulate that the articles pawned shall be kept thirteen months, but this period is usually extended to fourteen, and even in special cases a further limit has been granted to those who petitioned for it; it may, therefore, be said that generally the deposits are not sold before the fifteenth month. The owner is invariably warned beforehand by letter that his property will be sold at such a date by public auction, and informed that should the proceeds of the sale exceed the sum due by him to the establishment, according to the terms of his schedule, the surplus—called *boni*—will be held at his disposal for three months, after which it will go to the hospital funds. The proportion of unredeemed pledges averages five in a hundred for the ordinary loans, and one in a hundred for the secret *engagements*.

The articles doomed to be sold are taken from their place in the warehouses, and carried to a large apartment over the auction room, where they are verified by comparison with the original registration bulletin, and then sent below. The general public always know what category of goods is to be disposed of, as they are classified by an invariable rule. On Monday *bric-à-brac* and books are sold; on Wednesdays the better class of fabrics, laces, and shawls; on Thursdays jewelry and precious stones; on the remaining days the hybrid and miscellaneous "parcels," some of which are also put up on Thursday, when the stock of valuables is exhausted, which generally occurs about three o'clock. Any article put up for sale, even when already bid upon, can be claimed by its legitimate owner at the last second, provided the auctioneer's hammer has not fallen. Of the 370 or 400 articles sold daily, this redemption *in extremis* occurs six or seven times, proving

how dilatoriness in business, even when of vital importance, is an idiosyncrasy of the pettifogging community.

The buyers are characteristically different according to the day, even according to the hour, and have each a distinct physiognomy. On Wednesday the female element predominates: women well, but showily dressed, mostly second-hand wardrobe sellers, having a keen eye for laces, Cashmere shawls, and the better kind of fashionable, little-worn costumes. On Thursdays, during the time when diamonds are offered, the Semitic type is in the ascendant; there are men present who can judge of a stone at a single glance, and detect a flaw with a dead certainty; the Jews form a ring, and if any outsider, tempted by the hope of a good bargain, attempts to bid, the community closes around him, and he is promptly made to recognise the futility of his expectations. On Monday morning the peculiar brogue of the *Auvergnat* dealer in kettles, brass, iron pots, and old iron is heard raising the price by one sou at a time; books have few amateurs, and are promptly disposed of in parcels mostly unexamined by the purchasers; common wearing apparel, chiefly men's, is handled and judged of with marvellous dexterity; but the greatest excitement apparently prevails over the bedding. Mattresses are turned, poked, punched, pricked, smelt, to ascertain their quality, age, and contents; the buying public, in its unclean but expressive popular jocularity, calls the sale of these articles "swinging the bug" (*balancer la punaise*).

The auctioneer or *commissaire priseur* may, at his own risk, give credit to his clients, and exact from them merely a sum on account, not under five francs, but he retains the article on which it has been advanced as a guarantee till the entire purchase money has been paid. The administration does not interfere in these arrangements, which, in fact, are generally profitable, for a considerable amount of deposit money drops into the coffers of the Mont de Piété, and thence to those of the *Assistance Publique*, as the service of the hospitals is now called; while after a specified delay the articles are a second time sent to auction.

### WHY THE DRESSMAKERS PAWN.

A large proportion of entirely new goods are pawned. When an artisan *en chambre*—that is, working at home for a master or factory—dressmakers, and small manufacturers find themselves momentarily embarrassed or pressed for cash, they will not pawn their watch, spoons, clock, or clothes, but any one of the articles they have completed. Perhaps a dressmaker has a dress length given to her to make up for one customer, and a gown half-finished for another; in order to buy buttons and trimmings for the one she will pawn the untouched material, get the things she wants, complete the dress, take it home with the bill, and, if she gets the latter paid, hurry to the Mont de Piété and redeem the other fabric; should she be kept waiting for her money, she pawns something else to go on with her orders, and by these transactions many of those belonging to the infinitesimally small *petit commerce* of Paris are enabled to carry on their profession, and keep the wolf from the door. The whole class of these home workers, and even others who labour on a more extended scale, have experienced the boon which the facility of raising money on the spot is to them, and the Mont de Piété may be called the benefactor of petty trade.

This mission had not been contemplated by the founders of the institution, but it was gradually and insensibly thrust upon it, as the confidence it inspired grew and became more largely spread. The borrowers have—and with justice—an unbounded confidence in the absolute integrity of the dealings at the Mont de Piété, and have more than once realised the advantages derived from applying to it instead of having recourse to the crushing usury of money-lenders, where, under their special circumstances, they would have to pay as much as forty per cent. interest, and incur the risk of an execution in case of non-payment. The interest on deposits amounts in the aggregate to nine and a half per cent.

It has been erroneously supposed that a stagnation in trade, a commercial or financial crisis bringing large failures, must necessarily increase the business of the Mont de Piété; on the contrary, for the reasons stated above, as soon as business is less brisk and no sales are executed, its operations decrease in proportion and it becomes merely an immense storage place.

### THE PEOPLE WHO PAWN.

One class of customers, but not the most numerous, is recruited among the so-called population of pleasure—women of loose morals, students who eschew the lectures, workmen who raise at *ma tante*, not at "my uncle" as in England, the price of a seat at the play, of a longer spell of laziness, of another drunken bout. Among these must be reckoned the gamblers who belong to all the classes of society, and who as a rule bring the most valuable pledges. They have to settle their debts of honour at a very short notice and raise money recklessly; frequently the pledges they bring are women's jewelry which they have obtained by fair means or foul, sometimes with unlooked-for and disastrous consequences. Once a young foreigner living in Paris had lost largely at cards; with his sister's consent he carried her diamonds to the Mont de Piété, received a considerable sum in exchange, paid his debt; but, yielding to his master passion, gambled again, incurred heavier losses, and to meet them disposed of his pawn voucher to a low jobber, who, without his knowledge, immediately redeemed the diamonds, broke up the settings, and sold the stones to a wealthy young fellow who was about to marry. The Mont de Piété is naturally entirely disinterested in such affairs, its own share in the transaction ceases when the correct ticket is handed in, the interest paid, and the pledge returned to the holder. However, after a time, the young foreigner being once more in luck, and his sister claiming her jewelry, he went to the jobber to get back the voucher, only to find the stones beyond his reach. They were traced with the utmost difficulty to a first-class jeweller, who was resetting them for the bridegroom. Fortunately the two men belonged to the same set and were able to come to an arrangement by which the

stones were restored to their original possessor, otherwise it is more than probable that the law would have been called upon to interfere and to demand by what right the depositor of the diamonds had disposed of a recognisance[1] for valuables which did not belong to him.

The very poor do not frequent the Mont de Piété, although at first sight they should seem to be its chief clients. The most flagrant proof of their abstention was made evident on several occasions, but especially in 1871, when England, actuated by a generous sympathy for the sufferings and privations of Paris during the siege, forwarded, as soon as the blockade was raised, substantial and abundant help. Among other sums one of 20,000 francs was sent to be especially devoted to the redemption of workmen's tools supposed to have been pawned during the distressing period of forced inactivity. The British Committee apologised for the smallness of the sum, which must necessarily be ludicrously disproportionate to the exigencies of the case, expressing a hope that it might be further supplemented. The appeal made by the Mont de Piété to the clients belonging to the category to be benefited by the English donation was as loud and public as it well could be, and yet only 2,383 tools were claimed and delivered, the cost of redeeming them amounting only to 13,470 francs, thus leaving a considerable surplus of the fund devoted to their redemption. At that time the warehouses of the institution contained 1,708,547 articles, representing loans to the amount of 37,502,723 francs. The difference between this enormous total and the fractionary figure representing artisans' tools speaks for itself, and disposes of the fiction that genuine destitution pledges its means of livelihood; had it left pledges at the Mont de Piété it would have hastened to recover gratuitous possession of them. The majority of the tools are pawned by the employers. If a man gives work to six or seven hands and has to suspend labour for some cause or other, he dismisses them and pawns the plant till he can replace his workshop on the usual footing. Sculptors will sometimes pledge their chisels or even fragments of a commenced statue or group in a moment of sudden difficulty.

The 20,000 francs sent by England does not constitute the only case when a free redemption of pledges was granted. Almost every Government since 1789 has decreed a similar measure under some pressure or other, the Government of the National Defence and the Commune among the number. The gratuitous liberation is commonly restricted to the loans not exceeding ten to twenty francs. The result has almost invariably proved to be the same: the articles carried off at one wicket are taken to the other to be pawned again. If 4,000 redeemed tickets could be delivered up in a day the Mont de Piété would certainly pay out more than half the number again before sundown, for the simple reason that a five-franc piece is a more acceptable currency than a pillow or an old coat, and that the client who has done without either for a certain time is always anxious to secure the cash instead of the goods.

Inebriety, which fills the mad-houses, sends many customers to the Mont de Piété, who barter all their possessions for the loan that can be converted into alcohol and the pledge which they forget to withdraw. Another, and fortunately not a very numerous, class of the "*publics*" is one which is under the constant and watchful supervision of the detectives, namely, members of the light-fingered community who strive to make the institution a party to their pilferings, but in reality have in it a sagacious and powerful enemy. The Institution is in daily communication with the Préfecture de Police, giving information if suspicious articles are pledged, and instituting minute perquisition in its abundant stores and well-kept ledgers whenever after some important robbery it receives the officially printed list of the missing articles.

### HOW FRAUDS ARE DISCOVERED.

Through the medium of the Mont de Piété circumstances have come to light and facts been exposed which would otherwise have remained concealed, owing to the position of the persons concerned. Without quoting more recent examples, an incident which occurred during the Second Empire is not without interest. It was before the promulgation of the Imperial decree limiting the maximum of a loan to 10,000 francs. A lady of title, belonging by her alliances and connections to the most illustrious families of France, brought to the Mont de Piété several sets of entirely new jewelry, so valuable that she received upon them more than 50,000 francs. The officials, who knew their client by name and reputation, and had felt no scruple in advancing the sum, were startled by an advice from the Police de Sureté, some time after, intimating that stringent inquiries must be instituted, as serious doubts existed as to the legality of the transaction. Various jewellers of honourable status had lodged a complaint. It appeared that, presuming on the confidence inspired by her name, the lady had purchased the jewelry on credit and almost immediately afterwards pawned the sets. The vendors, after several fruitless applications, finding themselves unable to obtain the settlement of the debt, had begun to suspect a swindle, and stated their case to the police, who had at once entered into communication with the Mont de Piété. The scandal was enormous; a vast number of distinguished people were implicated in the affair; the lady had no money, having promptly spent the sum she had raised; the family absolutely refused to be made responsible; the jewellers were clamorous; the Mont de Piété was powerless to surrender the pledge except under the usual forms and payment. But just as legal proceedings were about to be instituted, the action of the law was abruptly stopped. The Prefect of Police had mentioned the case to the Emperor, who from his private purse had paid the money required to redeem the jewels in full and have them restored to the merchants. The strangest part of the story is that Napoleon the Third, deceived by a similarity of names, thought that he was rendering this inestimable

[1] The pawn-ticket is really a receipt to the bearer, and it is sufficient to present it to enter into possession of the article it represents.

service and rescuing from a terrible position a woman whose husband had till then been making violent opposition to his government.

Another time it was discovered that admirably counterfeited pawn-tickets had been passed into circulation and sold as genuine to creditors who, when they went to redeem the articles corresponding to these sham vouchers, found that not a trace of them existed in the storage rooms, and that the duplicates were not in the ledgers. It was ascertained beyond the possibility of doubt that all the officials were blameless, and after a protracted search the suspicions of the police fell upon an individual of apparent respectability enjoying a reputation for honesty and filling an important post. It was gradually found that he had under plausible pretexts obtained easy admission to several of the branch offices, that he had given two different names, occupied three domiciles, and moreover frequently resided at a fourth belonging to his mistress. He was arrested in the latter and taken before the commissary of police. He betrayed no emotion even when the accumulated evidence became overwhelming ; quietly putting his hand in his pocket, he drew out his handkerchief in which a pair of compasses were concealed, and plunged the weapon in his heart with so sure an aim that he fell down dead.

### TWO KINDS OF SHARPERS.

The Mont de Piété has to protect itself against two kinds of sharpers whose *modus operandi* is quite different, and who are known under the slang appellation of *Chineurs* and *Piqueurs d'once*. The first are clever swindlers who take out a licence and profess to be dealers in second-hand jewelry. *Chiner* consists in fraudulently enhancing the seeming value of the goods ; it is most frequently done in the following manner :—From a genuine gold watch-chain the *chineur* takes the swivel and a certain number of rings, always selecting those on which the stamp is affixed ; he then adroitly inserts them into a chain of similar design, but which is only brass thickly gilded, and soils or otherwise defaces it to give it the appearance of being old and worn. When it is quite satisfactory he takes it to the Mont de Piété. The appraiser verifies the stamp, and finding it correct he naturally concludes that he holds a real gold chain, weighs it, and names a sum many times in excess of the value of the article. The depositor, provided with false papers, gives a false name and address, and of course never redeems the pledge, so that the fraud is only discovered when the article in course of time is sent to public auction. The Company of the *Commissaires Priseurs* has to bear the loss, and, notwithstanding the extraordinary sagacity of its appraisers, has more than once found itself responsible for large sums loaned on counterfeit articles.

Jewelry is also falsified by pouring lead into hollow cavities of sterling gold so as to double the weight : this operation is called "stuffing." On one occasion a large quantity of gold braid was pawned for 30,000 francs which, although it had deceived the expert, proved to be only a perfect imitation in tinsel.

Some of the more enterprising *chineurs* facilitate their operations by procuring and using sham stamps and trade-marks. One of them, known to the detectives as the "king" of the tribe, had been for years under surveillance, but without ever being caught in the perpetration of an offence. He had been forbidden by the administration to pledge any article whatever, but circumvented this precaution by purchasing licences for four accomplices and sending them to pawn his wares in his stead. The art of *chiner* is not confined to jewelry only, it extends to a wider range and to various subjects. Mattresses with only a thin layer of wool near the ticking are filled with sea-weed ; common calico is covered with a chemical preparation which gives it the glaze of fine Irish linen ; clocks and watches have their works removed and replaced by spurious ones that do not go ; and so on *ad infinitum*, with a marvellous patience and ingenuity that taxes the perspicacity of the Mont de Piété severely, and too frequently meets with ill-deserved success.

The *chineurs* rob the office, the *piqueurs d'once* use it as a receiving house. Formerly this second designation was only applied to the frauds perpetrated by the weavers *en chambre*, who, provided with the materials of their trade by their employers, kept back skeins of wool, silk, or thread, and yet contrived to return the equivalent weight in tissue by leaving the fabric exposed to damp, or rubbing it over with some compound that added to its weight. In time the term was applied to all workers, artisans, or clerks who rob their masters by purloining their goods ; the assistants of jewellers who secrete fragments of gold, of drapers who cut off a few yards of material, of shoemakers who pocket pieces of leather, are all *piqueurs d'once*. Many of the shopkeepers at one time petitioned that the Mont de Piété should be prohibited from receiving new articles, but such a measure would have ruined the petty tradesmen and the private workers who, as explained before, depend as a pecuniary resource on this mode of raising successive loans on the materials at their disposal. Moreover, many of the thefts and larcenies have been traced and the articles recovered by the owners through the agency of the Mont de Piété itself and the judicious precautions it takes to protect property.

The Mont de Piété has a system of "surveillance" which equals that exercised by the Bank of France. Whenever its suspicions are aroused, and sufficient apparent cause exists, the Direction has the right of peremptorily forbidding the *engagement* ; but it disposes of other means which make it sometimes advisable to accept the article, even when strong deductions point to its having been stolen, and likewise to appear satisfied with the name and references supplied, thus succeeding in more surely tracking and exposing the culprits while lulling them into credulous security. On the other hand, the most scrupulous discretion is observed with regard to honest and confiding depositors ; the secret of their names and transaction being religiously kept.

### SUGGESTED CHANGES.

If the institution were to be freed from the vulgar petty rogues who attempt to swindle it, the gain would be small, and by hampering its action

the general public would be the losers; the interest of the public must ever remain the primary consideration. Undoubtedly, like all systems, the Mont de Piété is not perfect, and it is open to many improvements yet. The most important would be to affranchise it from the charge—stipulated in a decree of the year XII—of surrendering all its surplus revenues to the *Assistance Publique*—which took the place of the General Hospitals—without drawing any capital therefrom. From 1806 the Mont de Piété has given to the hospitals over thirty-five millions; had these sums been successively capitalised, it would now be no longer compelled to borrow in order to lend, and could reduce its rate of interest on the loans. Again, if it could get rid of the *Commissaires Priseurs* it would realise a serious economy which would benefit the depositors, who actually pay ½ per cent. on the first valuation, and 3½ if the unredeemed pledge is sold at auction. At present the law is dead against this measure, for it decrees that no article whatever can be sold by public roup within the radius of Paris, except by the auctioneers belonging to the Company of *Commissaires Priseurs*, and that no private individual or public official has any right to interfere. This statute is prudent and wise in principle, as it obviates many irregularities and abuses; but in this particular instance of the Mont de Piété, no inconvenience could arise from repealing it, for the institution created to provide loans to the impecunious at the lowest possible rate of interest is under the direct supervision of the State, submits its books to the *Cour des Comptes*, offers guarantees of unimpeachable integrity and security, and is so situated that it can entrust the valuation of the pledges to its own employés, men whose aptitude for appraising is unrivalled, and who would, moreover, undertake the task at their own risks and perils, with corresponding financial advantages to the public.

Taking average figures for a certain number of years, it has been calculated that the deposits amount annually to about one million five hundred thousand articles, on which about thirty millions of francs are loaned. These figures are, of course, subject to considerable fluctuations, following the condition of public affairs and general prosperity like any other financial operation; but, nevertheless, they convey a fair approximate idea of the strong hold taken by the Mont de Piété on the confidence and in the daily habits of France, and they show how far more extensive and important are its transactions and action than could ever be those of even the most successful private enterprise or of isolated pawnbrokers.

### SUPPLEMENTARY FACTS.

Before concluding this rapid summary a few supplementary facts should be mentioned, which only tend to further illustrate the extreme attention and minute care brought to bear on every branch of this vast and old-established institution.

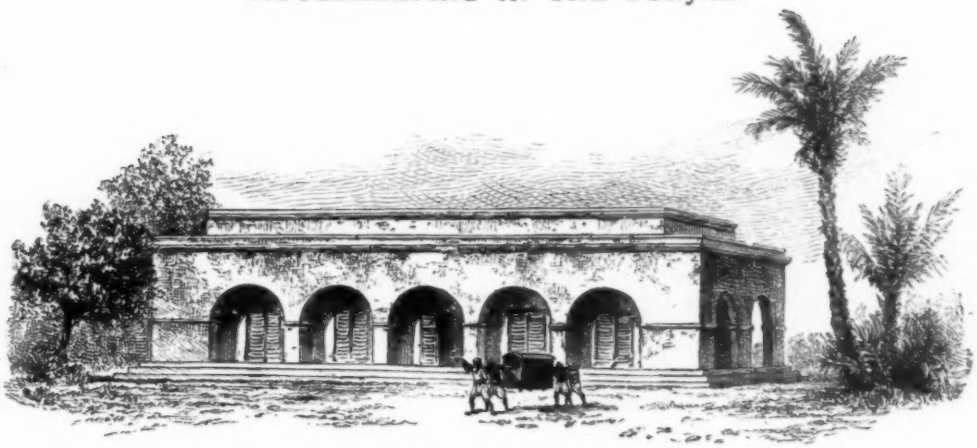
Pensions are awarded to the officials of every degree after thirty years' service in any municipal function, provided fifteen of them have been spent at the Mont de Piété; the capital is derived from taxations levied on the salaries; provision is also made for the widows and orphans of the employés, the former receiving one third of the computed aggregate salary of the deceased, the latter five per cent. each on the total.

All the men doing duty in the offices or storehouses have to wear the regulation uniform of the establishment, rooms being set apart where they can assume it before beginning work and on leaving it. The hours of work range from 7.45 A.M. to 8.30 P.M., more or less according to the functions and duties.

Certain kinds of articles are never received as pledges, such as military uniforms and effects, crosses of the Legion of Honour, articles bearing the mark or stamp of a public institution, fire-arms, wet or soiled linen, clothes cut out and unmade, books, prints, or photographs of an obscene character, gloves, furs, or fur-trimmed garments.

The salary of the Director of the Mont de Piété is 15,000 fr., a trifling sum compared to the total amount of wages and salaries, which for all the branches of the service reaches the figure of 1,273,000 francs. The last statement of accounts drawn up on March 31 of last year, and which with other documents the writer of this article has been able to examine, owing to the kindness of the Director, estimates the takings throughout the central and auxiliary offices of the Mont de Piété, and from all sources, at 107,223,413,47 fr., and the outlay at 96,740,073,92 fr., leaving a margin of nearly ten millions and a half.

The same documents show that the amount of reserve capital at the State Treasury resulting from the issue of bonds was so considerable in 1886—amounting to 11,810,000 fr.—that the administration decided to stop any further issue, and to refuse all applications for new bonds. Had the Mont de Piété continued willing to accept the money offered by the public, thirty or forty millions more would have found their way to its bank.



The general statement of business matters sets forth a notable and steady diminution in the number of deposits within the last four years, the public pledging less, and being more anxious to place its savings in the safe keeping of the Mont de Piété. On the other hand, the sale of unredeemed articles has increased, 400,000 having been disposed of in this way above the usual average number. In 1886 475,000 francs were handed over by the administration to the *Assistance Publique*; 2,191,310 articles were pledged, or the pledge renewed, representing a sum of 54,801,399 fr.; 2,338,544 deposits were liberated by the owners, representing a value of 56,614,151 fr.

The council of administration is presided over by the Prefect of the Seine, and consists of the Prefect of Police, three members of the Municipal Board, three members of the *Assistance Publique*, and three citizens inhabiting Paris. The Director is appointed by the Home Secretary—*Ministre de l'Intérieur*—the forty-two other principal officials by the Prefect of the Seine, and the subordinates, servants, and common hands by the Director.

The Mont de Piété is open for business all the year round with the exception of the fourteenth of July, kept as a national holiday, but on Sundays the public are not admitted after twelve.

M. S. VAN DE VELDE.

# HOUSEKEEPING IN THE PUNJAB.

OUR HOUSE IN THE PUNJAB.

BUT what a house! And as to the keeping, nowhere is the instability of human possessions more graphically illustrated than in the Punjab.

Imagine a house with no front door, no back door, no bells, no staircase (for there is no upper storey), no passages, no ceilings. There are no windows, properly so called, but every room has at least four sets of double glass doors, through which those who come and go make their entrance or exit as it pleases them. Before these hang "chicks," —delightful blinds of split bamboo—forming a screen from dust, glare, and curious eyes; or, on winter nights, purdahs—thick wadded curtains of blue and scarlet, stuffed with cotton, admirable for the prevention of draughts. Through the "chicks" only a dim light is admitted to the rooms, making the wide shady verandah a pleasanter place for the Mem Sahib to work or read, and the Sahib to lounge and smoke. Each room opens into the adjoining room; the communicating doors are never fastened; in the hot weather they are set wide open, and a light curtain is hung across the opening.

The floors are covered with a coarse, loosely-plaited matting; beneath is a species of concrete, called "chunam," which soon gets broken away, and the dust forces itself through the matting, covering every article of furniture. Occasionally, beautiful carpets, made at the Agra gaol, or blue and grey dhurries from Umballa, are spread in the centre of the room; but, with the present rate of exchange, there are few Anglo-Indian officials who can afford to risk their speedy destruction by white ants from below, or a deluge of mud from the roof.

The rooms are very lofty, the walls whitewashed, and in the rafters live generations of sparrows, who almost make Anglo-Indians imagine themselves in dear, smoky, grimy London. They quarrel, flirt, chirp, and flutter, from daybreak till dusk, pilfering all provisions within their reach, and sometimes mistaking a lamp for sunrise, when they continue their chirping far into the night. The square corners of the verandahs are filled in to form bath rooms, and there is a hole in the wall through which the water from the oval tin bath is easily tilted, thus

GOVERNMENT SERVANT.

running out to revive the dust and grass of the compound. The gratings that protect these holes are usually missing, so that jungle cats can creep

in and assuage their thirst from the large earthenware chatties without difficulty. Large frogs, too.

KHANSAMAN.

may generally be found hopping about in the damp corners.

The roof is flat and composed of mud, which

SWEEPER.

heavy rain easily penetrates, but the verandahs are usually thatched, giving to a Punjab station quite an Arcadian appearance, in spite of the golden fringe of hornets always buzzing round every bungalow.

These hornets are of two kinds: yellow with orange markings, and a rich velvety brown with lemon bands. The latter are very venomous, but both sting severely, frequently causing a numb sensation and loss of power for some hours, while the pain is sufficiently acute. About noon the hornets are specially active; they will creep through the smallest crannies and carry off materials for their paper-like nests, and at night may often be seen asleep, hanging in clusters from the framework of the doors. Stings are, however, of rare occurrence, and even children escape in a wonderful manner.

SYCE.

Owing to the cold winters, insect life is but sparsely represented in the Punjab. The only real pest are the white ants. They work their way through the walls and floor, throwing up covered galleries, which conceal their operations until they have entirely destroyed books, linen, pictures, and wood-work of every description. The exterior form often remains in hollow mockery, while every particle of the interior has been destroyed. Oleographs, the shadows of their former selves, will remain upon the walls with singular pertinacity, perhaps held in position by these ingenious galleries, till a puff of wind, causing them to fall, reveals the fact that only the upper surface of the picture continues to exist. Thanks to the ravages of these exasperating little creatures, Punjab bungalows are very dilapidated tenements. The first step on hiring a bungalow is to have the beams tested, and, unless this is done,

the family may have been but a few days in occupation before they are aroused in the middle of the night by beams falling on the last remains of an English dinner-service proudly displayed on the sideboard, on the child's cot, or any other valuable possession. The process of replacing beams is very simple. A couple of men will knock a hole in the wall, pull out the rotten timber, and shove in a fresh beam with as much sangfroid as an English carpenter would mend the leg of a chair.

A Punjab household consists of a prodigious number of servants, of various nationalities, castes, and creeds: one or two ayahs for the service of the Mem Sahib, and fourteen or fifteen men-servants—each man exerting himself to combine

MALLI.

the minimum of labour with the maximum of time. The sweeper sweeps the floors, lights all fires, removes refuse of every description, and feeds the dogs and poultry, taking the tiny chickens for a daily walk, and waving a wand to drive away the kites. The bheestie brings water in a great leathern skin for the family, the servants, the horses, cows, poultry, etc. The khitmutgars wait at table, clean the plate, cook the breakfast, make cakes and confectionery. Two are essential, unless the Sahib is a bachelor. A messalji is employed to wash the crockery, spoons, and forks. For this purpose he sits in the compound, with a bowl of water, and is speedily surrounded by the pretty grey squirrels, and a circle of crows, kites, and vultures eager for scraps.

The khansaman is a sort of house steward, who contracts to supply the principal meals at a fixed rate. At an early hour he goes to the bazaar, attended by a coolie wrapped in a solitary blanket, to carry his purchases, and a sleek, well-dressed

DIRZI (TAILOR).

writer to record them in English characters. The cook's house is always a detached building, crowded with myrmidons, who do the actual cooking under

GWALLAH'S WIFE.

the khansaman's direction. The bearer acts as the Sahib's valet and personal attendant, he trims the lamps, and sits in the verandah to receive and

announce visitors, and to summon the other servants. Then there are the dhoby or washerman; the dirzi or tailor, generally clever, but an inveterate dawdle; the syces or horsekeepers, and their attendant grass-cutters; the gwallah or cow-

GRASSCUTTER.

man; and finally the chokydar, who guards the house at night, establishing himself in the verandah with a lantern, a coffee-pot, a charcoal stove, a huge volume of devotions, a resai, and a thick stick. He either rolls himself in the resai and sleeps soundly all night, or, to keep himself awake, chants at the top of his voice wild, melancholy litanies, occasionally clattering round the house in his heavy shoes, effectually waking the sleeping inmates.

No Punjab servant sleeps in the house, and as they all reside in the compound with their wives, children, sisters-in-law, nephews and other relations, their dogs, goats, and occasionally a stray bullock, quite a miniature village is formed. Very picturesque is the appearance at dusk, when the fires, blazing outside each hut, throw into strong relief the groups of men, women, and children huddled round them. During the day the people live out of doors, squatting on the ground in front of their huts. The women are engaged pressing into shape cakes of manure, which, after being dried in the sun, are used as fuel; or in polishing the beautiful brass vessels, used for cooking, eating, and drinking, and which are handed down through several generations.

These huts, called godowns, vary according to the rank of the occupier, but the walls and floor are always of sun-baked mud, and, as a rule, the door is the only aperture through which light and air can be obtained. Hindoos often keep their huts beautifully clean; the Mohamedans, especially Mohamedan women, are always dirty and slovenly, content to live in the utmost filth. By day the family bedsteads, consisting of a low wooden frame with a matwork of rope, are placed outside to air. In the hot weather, the people sleep out of doors on these charpoys, shrouding themselves, after the Indian manner, in a long, white drapery. These motionless, silent figures, waiting for the dawn, have a very weird effect.

Punjabis are desperate gamblers, losing so heavily at cards that they are generally over head and ears in debt to the usurers, a state of affairs they endeavour to retrieve by robbing their masters of money, stamps, and any article convertible into hard cash. If a head servant has committed a theft, and suspicion is aroused, an inferior servant of the same creed will at once confess the crime, his fellow servants will join in accusing the innocent

MOHAMEDAN BOY.

man, letters will be sent through the post, and the most circumstantial evidence brought forward; but though the Mem Sahib may be well aware that the whole is a tissue of lies, she will be quite unable to prove her conviction, nor will efforts to help the innocent man be of any avail. He will prefer a thousand times to undergo the penalty of the English law, rather than incur the displeasure of his own caste and creed.

As of necessity some of the servants are Mohamedans, others Hindoos, the jealousies, cabals, and intrigues are endless, the fiercest hatred

existing between the rival creeds. The Hindoo is turbulent, obstinate, and generally impracticable, but he has not the same skill in lying as the Mohamedan. The Mohamedan is grave, decorous, the essence of seeming respectability, but in reality stealthy, steeped in dissimulation. As to secret correspondence, clandestine negotiations, for these his ingenuity is unrivalled, his curiosity insatiable, his patience in obtaining information unwearied. The Sahib and the Mem Sahib are watched with lynx-like eyes, and where English is not understood, the power seems to exist of guessing the sense by watching the movement of the lips. The foibles, virtues, and vices of every Englishman and woman in the station are thus intimately known to the native population, who will not fail to use the information when occasion serves.

Although intoxicating drinks are strictly forbidden to Mohamedans, there is no doubt that many imbibe whisky on every opportunity. They never, however, lose their grave decorum, and only betray their delinquencies by a peculiar swaying movement somewhat dangerous to the Mem Sahib's crockery.

The Punjabi is slow, sulky, and revengeful, capable of great cruelty, but extremely fond of children, and absolutely devoted to small babies. The women are very helpless, their physical powers of the feeblest order. The men are excellent cooks and wait well at table.

Servants, coming to be engaged, are required to produce "chits," testimonials from former employers. These are easily transferred from one man to his brother, cousin, or nephew, and as no sequence of dates is required, an unfavourable character is at once suppressed.

Wages cannot be considered high. A head servant will receive from Rs. 10 to Rs. 15 a month, inferior servants considerably less, and all find their own food. The rice, dahl (a species of lentil), and parched grain, on which they subsist, are so cheap that after a few months of service they often prefer to retire to the bazaar, and live upon their capital, or else they will "go sick," and provide the Mem Sahib with a substitute. The Mem Sahib pays the same amount, but the substitute is only permitted to retain a bare pittance, the remainder being exacted by the imaginary invalid.

An elaborate system of commission prevails in every department, a high percentage being mercilessly exacted from every pedlar, or box wallah, who enters the compound. The servants have also their own *clientèle* of tradesmen, inventing a thousand excuses to exclude rivals. No rival will ever venture to thrust himself forward, but should the Mem Sahib insist on his being produced, he will himself assure her that his prices are exorbitant, his goods inferior, resorting to any subterfuge rather than enter the lists.

Marriage portions are a real tax upon the Punjabi's resources. Young girls are married as soon as possible. Even a poor man will be expected to find Rs. 30 as his daughter's portion. The Mem Sahib is requested to advance the amount, and these advances make the paying of wages a complicated affair.

All the servants wear white clothes, except during the winter, when an allowance is given for warm clothes. The Punjab winter lasts from November till towards the end of February. The middle of the day is delightfully warm and bright, but the nights are very cold, and even in February, in the shelter of the verandah, the thermometer at 8.30 A.M. will stand at 35°. There are some grey days, especially in the neighbourhood of the great rivers, when it would be pleasant to sit over the wood fire all day; the wind is bitter; and the whole country presents a bare, desolate appearance.

VALET.

Spring, however, comes very suddenly. March is a perfect month, and in April the reapers are busy with the barley harvest. At no season of the year may immunity be obtained from the Punjab dust storms, which, rising with a sudden whirlwind, produce a state of semi-darkness, a terrible din of banging doors, and cover everything with a thick layer of fine reddish dust. The trees sway and groan. Overhead there is a yellow pall like a London fog. Columns and clouds of dust blow along the ground. The temperature falls considerably, and the dust filters into cupboards, through cracks and keyholes. The glass in the dining-room presents the most extraordinary appearance, and even dresses carefully covered look as if they had been sprinkled with a dredger.

From May to November the heat is intense, a

burning, scorching heat, and punkah coolies prove a troublesome addition to a household too numerous already. Three coolies are necessary for each punkah, to relieve each other day and night. The Mem Sahib goes to the hills, though the excessive rains at this season in the hill country make this rather a doubtful pleasure. Her servants, too, will seldom accompany her. They easily contract low fever from the damp. Moreover, every man is passionately attached to his own village, and, as he observes to the Mem Sahib in a sepulchral voice, if he dies away from his own kindred, who will spread the earth upon him? In these migrations, it is necessary to carry lamps, crockery, hardware, etc., as furnished lodgings are unknown. Bedding must always be carried in the Punjab, even in going to a friend's house. Indeed, the entertainment of guests is delightfully easy, as each guest brings his own bedding and his own servants.

In many Punjab households "chuprassis" are kept, confidential servants who are employed to take messages, arrange purchases, and other matters. In the hills four or six "jampans" are necessary to carry the Mem Sahib in her "dandy" along the steep, narrow, mountain roads.

No Punjab servant ever appears with grey hair; most of them affect jet-black hair, eyebrows, and beard, which are re-dyed at regular intervals; but some servants like to adopt a different tint each time. Their eyes are always darkened artificially, and they are fond of chewing betel-nut; but this habit the Mem Sahib soon forbids.

House-rent is not expensive, and firewood and kerosine oil are the only costly items in Punjab housekeeping. Provisions of all kinds are cheap, butcher's meat *2d.* per pound in the plains, *4d.* in the hills. It is small but good, and the diminutive size of the joints a decided advantage in the hot weather. "Hump" is considered a great delicacy, and is very like corned beef. Game is very abundant, especially snipe, woodcock, black partridge, and sand grouse; quails are very plentiful as they pass through on their annual migrations. Owing to the long distance from the coast, refrigerators are little known. The ice-boxes in use are of very clumsy construction. Soda water is often cooled by being suspended from the bough of a tree in a basket filled with wet grass, which a servant swings slowly backwards and forwards to catch the breeze. If milk is purchased from the bazaar, the cow is driven into the compound, and to the edge of the verandah, to be milked in the Mem Sahib's presence. The cow is always attended by her calf, and by the gwallah and his wife. The gwallah's wife, with her long white draperies, magnificent silver ornaments—anklets, armlets, necklets, and earrings—and on her head a pyramid of brass vessels for measuring milk, is one of the most picturesque figures of Indian life.

In Punjab housekeeping, the Mem Sahib will never find that her expenditure weighs very heavily upon her conscience. If she accompanies her husband into camp she will enjoy riding through the country in the fresh morning air. She will watch with a little excitement the transport of her commissariat by a string of some six or eight camels, and the adventures and variety of camp life will afford her plenty of amusement.

After a few years of Punjab housekeeping, she will not be easily discomposed by the minor accidents of life, and she will have learnt that luxuries are by no means an essential part of human existence.

C.

## Fairy Voices.

WHAT do you listen to, O my baby,
As you sit in the light of the setting sun?
For your great blue eyes are wide with wonder,
And the poor dead flowers that you pulled asunder
Fall from your fingers one by one.

Ah! could you tell me, you would answer:
"I hear the sounds that you cannot hear,
For I hear the beat of a mystic measure
That rings from the country of fairy treasure,
And the voice of a melody faint yet clear.

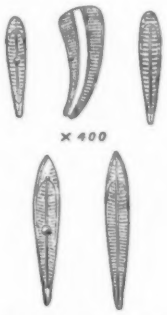
"I hear the horns that the elves are blowing,
I hear the stories the buttercups tell,
And all that the winds and waves are saying,
And what the white clouds whisper in playing,
And the chime of the quivering blue harebell."

Listen and learn while time lingers, darling!
As time flies those whispers will not remain,
For the sound of the years drowns the fairy laughter,
And trouble and heaviness follow after;
You will long for that music, and long in vain.

For there are people, my blue-eyed baby,
Who long as for nought else beneath the sun
For the voices you hear all day in your playing,
Which speak with you in your dreamland straying,
Which for them are over, and past, and done.

But I pray, my darling, that when you are older,
And you, too, have to mix in the world's wild strife,
And your ears are dulled by the hard earth noises,
An echo may come from those fairy voices
To help you to fight in the field of life.

C. G. D.



# WINTER RAMBLES IN SEARCH OF MICROSCOPIC LIFE.

BY W. H. SHRUBSOLE, F.G.S.

COLLECTING minute forms of marine life is a truly delightful occupation in fine summer weather, to which the possibility of capturing something rare or new generally adds an additional zest. As the year advances, and winter sets in, most amateur microscopists give up out-door work, and put away their collecting gear, and it necessarily follows that many opportunities of gaining further knowledge of Nature's works and ways are lost.

Regretting this, I determined last year to pursue investigations throughout the winter whenever practicable. This resolve was put into practice, and in the end I was amply compensated for any little discomfort by the abundance, beauty, and variety of the manifestations of life that came under my notice. The narration of a few noteworthy incidents in the course of the winter's out-door recreation may be acceptable to the readers of this journal and, such as it is, it is now submitted.

GOMPHONEMA MARINA.

The first experience worth mentioning occurred on the last day of the old year. The locality was Sheerness Dockyard. I went there in the expectation of examining the exterior of an ironclad in dry dock, and of collecting specimens therefrom. Nor was I disappointed.

It is true that I had some time to wait while preparations for docking the vessel were in progress, and that the atmospheric conditions were not of a very pleasant character. Still, some amusement was gained by watching the work of getting the ship exactly in the right position over the blocks on the floor of the dock, and then of "sharing up" with the object of keeping the vessel on an even keel when unsupported by water.

For this purpose, strong spars were placed between the dock wall and the ship, and fixed in position by wedges driven in by gangs of sturdy shipwrights, who delivered their forceful blows simultaneously all around, as the pre-arranged signals were given by the foreman standing in a prominent position at the head of the dock. When this operation was completed, a pumping engine of forty horse-power began its work of emptying the dock of water.

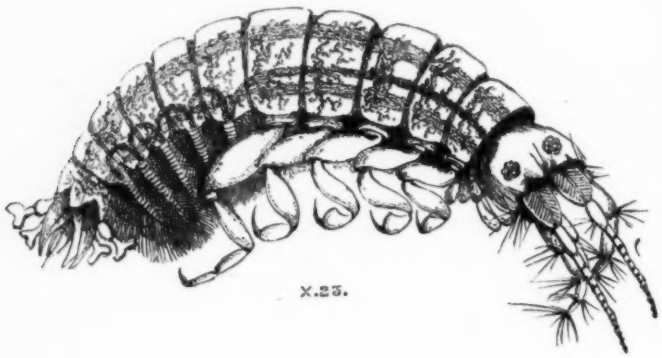
Taking advantage of one of several "catamarans" or rafts used by the workmen, I got alongside, and found that at and for a few inches below the water line there was a pretty growth of miniature seaweeds, both red and green, samples of which I bottled. Afterwards, with the microscope, I found that the little fronds were covered with diatoms, chiefly of the two species represented in the accompanying figures, arranged in the style of *chevaux de frise*.

SYNEDRA RADIANS.

Although the connection is rather suggestive of parasitism, yet these diatoms are free from the charge of obtaining nourishment from the plants to which they are attached. They are not parasites like Miseltoe, Dodder, etc., but harmless epiphytes.

While examining this belt of vegetation, my attention was diverted by a laughable interlude.

Some sailors and marines returning from leave wanted to get on board, and as the ordinary means of communication had been removed, they appropriated a "catamaran" for the purpose. Now, I found it difficult to balance myself properly on one of these primitive, floating structures, and here were no less than six stalwart fellows on one, and they all in merry mood. Pushing off from the dock wall, they swayed about, and tried to steady themselves by clinging to one another, till the overladen craft gave an awkward lurch, which sent most of them overboard in twelve feet of water. One caught a rope, and was soon out; another very coolly (in every sense of the word) struck out for the landing steps, up which he soon crawled, amid shouts of laughter in which he good-humouredly joined.



SYNEDRA RADIANS (*magnified 400 times*).

These and other diversions helped to relieve the monotony of waiting for the further lowering of the water. Very slowly, as the level was reduced, different zones of the hull came into view, and a larger area was open for examination. The plants

previously noted had evidently not been able to flourish or even to exist below the line of full exposure to light.

From where the plants ceased, the surface of the hull was plastered with tenacious mud about three quarters of an inch thick.

Scraping some of this off with the finger-tips, it was found by the sense of touch to be full of active life. On laying some in the open hand to facilitate examination with a lens, the wriggling of the little animals it contained tickled so much as almost to cause one to drop the lot involuntarily. The tiny creatures were soon seen and readily recognised as crustaceans of a kind that I have

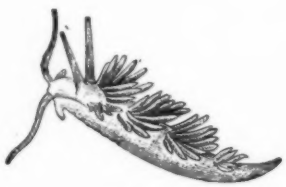
X.23.

COROPHIUM CRASSICORNE.

always found on ships' bottoms, and nowhere else. From the enlarged representation given above, it will be seen that *Corophium crassicorne* bears evidence of being related to the edible shrimp.

This species used to be considered rare, if not entirely unknown, on the British coast, and the infrequency of its capture may be inferred from the fact that till quite recently there was not a single specimen of it in the National Zoological collection at South Kensington. Those that are now there, I obtained from another ship in this dockyard.

In my opinion, these small crustaceans caused the enormous accretion of mud on the sides of the vessel. How was this accomplished?



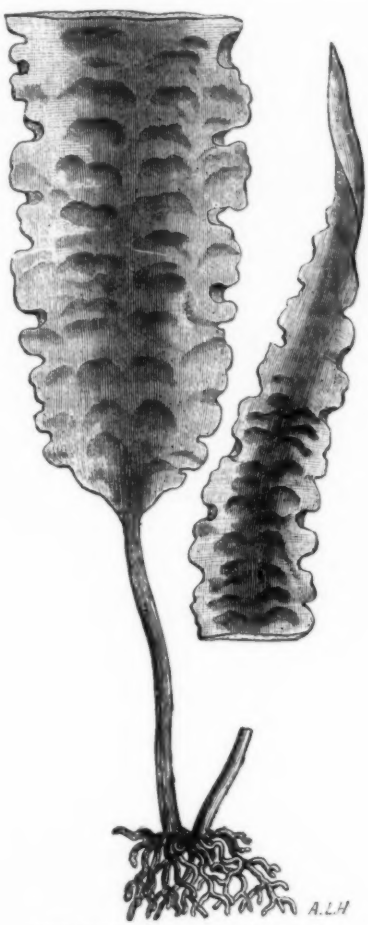
Probably a few wandering individuals first attached themselves to the plants growing along the water-line, and while holding on with some of their pedal appendages, with others they secured floating particles of matter—minute grains of sand and such like—and these they plastered together and fashioned into tubular dwellings closely packed side by side. Extension of the building operations below and around, doubtless followed at equal speed the rapid reproduction of their kind, until at last countless millions of these Corophia had attached many tons of mud to the ship.

The general dull tint of this crust was relieved here and there by darker patches made up of groups of mussels. These when quite young, and in the free and active state, must in their juvenile wanderings have encountered the ship, and become attached to it, mechanically, if not affectionately. When a mussel wishes to fix itself to any solid object, it puts its foot against it, and then puckers the surface of the extended member so as to form longitudinal grooves, along which it exudes a sticky substance that has the property of hardening rapidly on exposure to water or air. On the foot being withdrawn, tough filaments remain as mooring cables. No mussel is content with one connection of this kind. To prevent unpleasant motion, and to avoid insecurity, a second and often a third set of threads are laid out, and so placed that one tightens the others. The careful mollusc is thus moored stem and stern, like a vessel to a wharf.

My attention was called to one dense patch which had entirely covered the grating over the inlet to the ship's fire-engine. Had necessity for the use of fire-extinguishing apparatus arisen, the water supply must have been very much diminished below requirements, which might have led to disastrous consequences. Between the bars of this grating several barnacles had firmly fixed themselves, and thereby lessened the possibility of a full inflow. Other barnacles had actually established themselves on the blades of the screw-propeller! They had thriven there also, notwithstanding the violent whirling they must have experienced whenever the vessel was under steam.

Among the other objects seen were some pendulous, slimy, semi-opaque things, which I saw were anemones. In tanks at home some of these expanded into very beautiful, snowy-white, feathery specimens of considerable size. A few shell-less molluscs, or sea-slugs (*Eolis*), were seen crawling about.

These creatures, in one of their embryonic stages, do possess shells, but on reaching maturity they have to do the best they can without protective covering. They are graceful in form when in water, and delicate in colour, and although unprotected, save by mimicry, which makes it difficult to distinguish them, they manage to kill and eat other animals that happen to be destitute of locomotive power.



EOLIS.

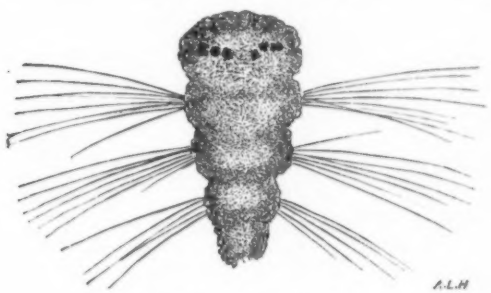
An interesting feature of their construction is the arrangement of the gills in branching tufts on the back. Such an arrangement in the higher animals would certainly facilitate medical examination, as well as the direct application of remedial measures in cases of disease, but might be attended by some inconvenience to human kind in these bustling times.

A few long fronds of oarweed (*Laminaria saccharina*), and some blades of sea-grass (*Zostera*), were the only other prominent living things, although various marine worms found a comfortable home in the muddy layer investing the ship. In connection with Laminaria, it may be mentioned that there is some reason for supposing the microzoa

known as Peredinia, and classed with the Infusoria, to be the active spores of the familiar oarweed. I have frequently put fronds of this plant into water wherein there were no Peredinia, and more often than not these have afterwards appeared in the tanks. The similarity of colour between the plants and an aggregation of the zoospores strengthens the conviction that these are the outcome of the other. Being furnished with vibratile hairs (*cilia*), by means of which active movements, and therefore distribution, are effected, there is in this respect also a close analogy between these forms

LAMINARIA SACCHARINA (*much reduced*).

and the lively spores which are well-known to proceed from Ulva and other marine plants. Further observation, however, is necessary before the close relationship between the two can be absolutely demonstrated.

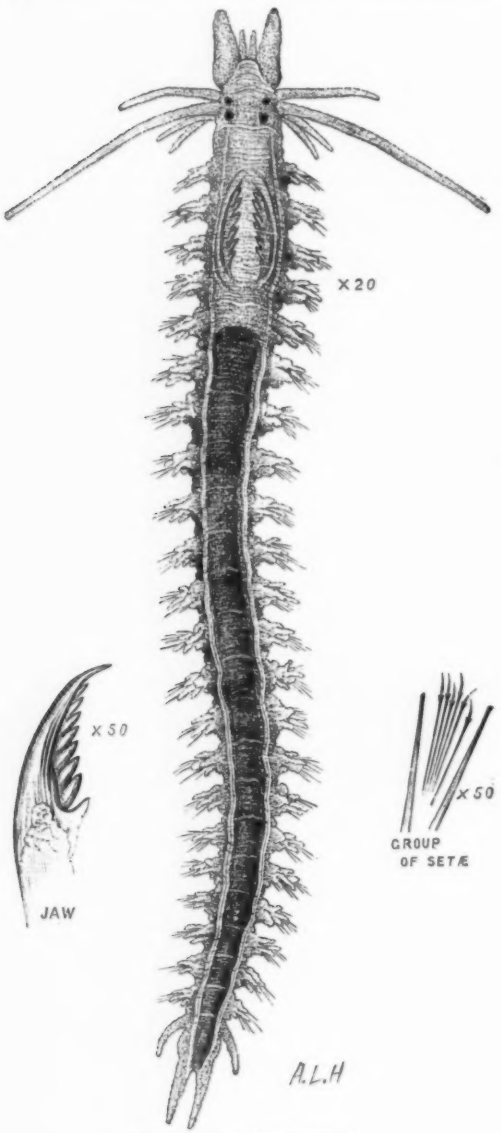


Well, when I found that there was nothing more to be collected, I had time to realise that the so-called dry dock in which I had been puddling for some hours scarcely deserved the name, seeing that several inches of slush covered the stone floor, and that under the bilge of the vessel, water was dripping from innumerable points upon any one moving about there. Yet when suitably clad one takes no harm, and is able thoroughly to enjoy a form of open-air recreation in winter, at once novel, harmless, and inexpensive.

A few days after this dry (?) dock experience, I went afloat in a small boat. Owing to the dense fog prevailing, in a few seconds the land was as invisible as if it were a hundred miles away.

I had with me a pail, and some nets made of very fine calico attached to metal hoops, and ought to have had a compass. The nets were towed behind the boat, and at short intervals lifted out and rinsed in some sea-water in the pail. After several of these rinsings, the water began to lose its transparency, and I knew thereby that I was accumulating a store of microscopic life. When enough had been collected, the boat was headed for land, which was done by listening for the sounds that came from the shore. Presently I landed, and had the pleasure of carrying home my half-pailful of dirty-looking water.

Letting this stand undisturbed for some hours, the minute organisms of a vegetable character and all inorganic particles gravitate as a sediment, leaving clear water above in which are many active little animals frisking about near the surface. Then, by pouring off the clear fluid into another pail, the two classes of microscopic life are easily separated, and the sediment becomes available for examination in leisure moments.



An opportunity having arrived, let us see what the little things skipping about at the surface are like. There is no difficulty in getting at them, for they crowd together and jostle one another at the side of the pail nearest the light. By dipping a glass tube among them, a fair sample of the whole is easily obtained. On the occasion referred to, and notwithstanding the low temperature of the water, there are many very young and fragile creatures that are usually met with in spring and summer. Of this character are those shown below, which are the young of a worm known to science as *Spio seticornis*. This annelid when full grown, and about to give up its roving habits for a

YOUNG OF SPIO SETICORNIS.

sedentary life, forms a dwelling for itself by excavation in almost any kind of rock material it happens to light upon. A striking feature in this worm is the pair of jaws of formidable dimensions which can be everted in front of the head when occasion arises. It works easily in chalk and in shells, and is quite equal to the task of tunnelling in limestone and granite. When it has bored about a half inch

into any substance, it curves its tunnel upward to the surface, and so obtains a second opening to its home, which thus becomes U-shaped. Such an arrangement facilitates cleanliness, and is of service in other ways. Although often closely crowded, these worms avoid encroaching upon each other's perforations. Within the compass of a square inch there may be scores of Spios dwelling,

SPIO SETICORNIS (FULL GROWN).

and this density of population causes the struggle for existence to be rather severe. The casual food supply, in the shape of floating particles of organic debris brought by tidal currents, is eagerly competed for, and in order to secure an ample supply of this prime necessity, first one and then another begin to build miniature turrets over their tube apertures, with any material at hand, so as to be able to overreach others without exposure to possible danger. Yet the advantage thus gained is not permanent, because the less enterprising members of the colony stimulated by hunger soon follow the example, until tiny tubular towers stand up all over the populated area.

When these erections are removed by accident or design, re-construction speedily commences, and by supplying the busy workers with different coloured sand or other suitable substance, the daily rate of progress can be measured when they are kept in a glass tank. Their food is collected by means of two relatively long flexible tentacles (shewn in the illustration much shortened by contraction), which are almost always in motion. Sad to say, neighbours sometimes quarrel when these whip-lash-like appendages interfere with one another's movements. When two happen to seize the same crumb, a fierce contest for sole possession ensues, and as each increases the tension by retiring as far as possible into its burrow, the towers bend over with the strain, and a real "tug of war" takes place, until one or other can hold on no longer. When contact is broken, both disappear sharply by the recoil that takes place.

It is highly amusing to observe that when food is gathered by one of these worms in the ordinary way, the tentacle is not wound around whatever it may be, but the particle is made to travel along the surface of the extended member to the mouth. This peculiar action is due to minute hairs (cilia) arranged in rows, which pass the object onward from one to the other. But at present we have to do with the larval form of *Spio seticornis* whilst it is still free to wander at pleasure. As a full description of its structure might not be interesting to the majority of readers, the figures may as well be left to indicate the great difference that exists between the juvenile and the adult form.

In our pail may also be observed, skipping about with a jerky motion, some immature barnacles which seem to be in a thriving condition, notwithstanding the low temperature of the water. These baby barnacles also present an appearance widely different from that of the stony acorn-shells, familiar to every sea-side visitor, into which they will, if all go well, ultimately become metamorphosed.

BALANUS BALANOIDES (BARNACLE), EARLIEST FORM.

Beside the foregoing, there are other little animals of crustacean affinities, from which, with microscopic aid, many zoological lessons may be learned. But perhaps enough has been said concerning the animals collected, so we will pass on to examine the sediment left in the pail. In dealing with this it is convenient first to wash it into a jar, so as to get it in handier compass. Then, with a dipping tube, a drop may be transferred to a glass slip, covered in the usual manner, and placed in position for scrutiny with a one-inch microscopic objective.

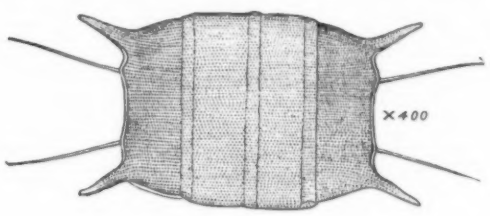
On leaving the shore, I noticed that the water was somewhat turbid, and now the cause of this is seen in the form of countless fragments, chiefly of inorganic debris too small to readily subside. Last

summer's dust is here present, though in another element, progressing towards re-composition in a newer stratum. The eye, however, rests with more pleasure on the graceful forms of numerous diatoms dotted over the field of vision.

It will be remembered that those of this class found growing on the ship's side were adherent to other plants. Here now are examples of sundry kinds that maintain an independent existence, and which, from being generally found in the open sea, may be considered as pelagic. These, now under inspection, exhibit great diversity of form, each having that which is common to its species, while all possess symmetrical beauty which charms the eye and compels admiration.

Truly, those microscopists who become absorbed in the study of this particular class of objects, and are, therefore, sometimes pleasantly spoken of as 'diatomaniacs,' have some reason for the limited range of their investigations.

Prominent among many other diatoms are specimens of more than one kind of Coscinodiscus. These, being discoidal in outline, and filled with rich aurigerous endochrome, are, whilst in the living state, highly suggestive of golden shirt-studs of diminished size.



LAUDERIA MOSLEVANA.

The one (*Coscinodiscus concinnus*) figured and described in a previous paper [1] may be taken as a type of the genus, which need not therefore be now described.

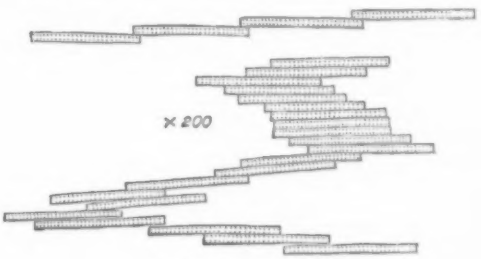
The next diatom to claim notice is one (*Lauderia Mosleyana*) which was unknown until collected by the naturalists of the "Challenger" expedition from the surface of the Arafura Sea, north of Australia. Now it turns up here in the estuary of the Thames. This strengthens the evidence already existing as to the wide diffusion of these pelagic single-celled plants.

Many species of these simple organisms seem to be able to adapt themselves to their environment in both hot and cold zones, provided always that the salinity of the water be not above a certain standard.

Some zigzag chains of *Biddulphia aurita* are also visible in every drop examined, and here and there are a few specimens of a closely allied form, *Biddulphia Bayleyii*.

BIDDULPHIA BAYLEVII.

[1] "Leisure Hour," August 1889 (page 534).



The cylindrical form, having conical ends and long terminal bristles of extreme tenuity, bears the appellation of *Rhizosolenia Setigera* (page 34). Is it not strange that this delicate object, in form but ill adapted to stand rough usage, should be able to preserve its integrity in spite of exposure to the awful force of stormy seas? Its immunity is probably due to its small dimensions.

This diatom increases by duplication in a singular way. Within the cylinder, two new cones begin to grow from each end, having their apices directed towards each other.

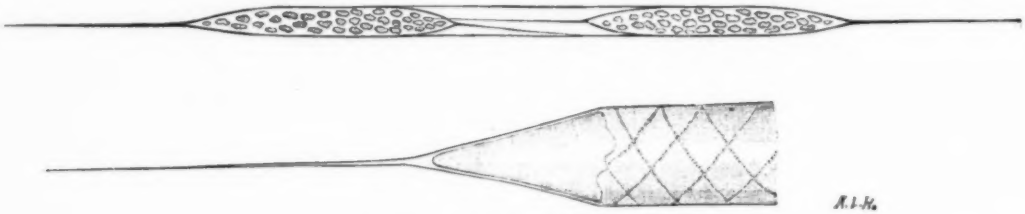
They continue to enlarge until the bristles overlap. After a while, the cylinder breaks asunder transversely, and then there are two diatoms where before there was but one. It will be seen that in this way each individual has two generations represented in itself. One end is new, and the other was part of the parent form. (Does not this continual rejuvenescence seem wonderfully like a form of perpetual life? [1]) The fractured end of the old tube drops away, and the diatom with a new lease of life rapidly increases in length and also slightly in breadth.

One stage of this interesting process is represented on the next page.

Another diatom (*Bacillaria paradoxa*), of singular agility in executing remarkable movements, now forces itself into notice. It was found in another drop of the sediment in the pail, and when first closed up between the glasses it remained quiet beneath some particles of rubbish. Whilst at rest, the numerous component frustules lie side by side like so many tiny rods arranged laterally with their ends in line. Non-activity, however, is of short duration. After a while, when the immediate surroundings have become familiar, the rods begin to move in one direction, each one slipping over its neighbour as far as is possible without losing actual contact, until the diatom stretches itself in a slightly curved line across the field of view.

BACILLARIA PARADOXA.

Without loss of time, it begins to close up either at one end or on the centre, just as so many soldiers in skirmishing order might do. Then again, it



[1] Since writing the above, I have found that the same idea was broached long ago by Ehrenberg, and that Prof. Weismann has recently written:

"Natural death occurs only among multicellular organisms: the single-celled forms escape it. There is no end to the development which can be likened to death, nor is the rise of new individuals associated with the death of the old. Each individual has the power of living on indefinitely, ever dividing, but never dying."

swings round a little so as to be able to make an excursion in another direction, which is necessarily in the same plane, because of the limitations imposed by the glass. These curious extensions and retractions are repeated till the observer becomes tired of watching. When several are seen executing their movements simultaneously, the sight is one that rivets attention, and makes it hard to withhold the conclusion that these agile plants are sentient beings acting under the impulse of will.

I have found this diatom in brackish ditches, but more often in the open sea. In this locality I have collected it at all seasons, and once I proved its existence for an unbroken period of twelve months. It has been as abundant in January as in June, and I have sometimes secured it by merely dipping a bottle when walking along the beach at high water.

Count Castracane, in his Report on the Diatomaceæ, collected by H.M.S. "Challenger," says :— "When the movements of Diatoms are considered, the peculiarities presented by those of the genus

RHIZOSOLENIA SETIGERA (*highly magnified*).

Bacillaria are the most remarkable and mysterious of any. Although various hypotheses have from time to time been advanced to explain such wonderful phenomena, no observer has been able by the most ingenious methods, by the use of the most perfect object-glasses, or the most efficient methods of illumination, to discover any special organs that might bring about such curious results."

This problem has been assiduously worked at by microscopists of many nationalities ever since this species was described by Gmelin in 1788, and still the solution lies in the future. He who may accomplish it may well be proud of the achievement.

Yet one more diatom must be introduced, because of its unique form, and because it represents an entirely new genus. Its figure is that of a narrow segmented band twisted longitudinally in a very open spiral. Like all diatoms, each segment or cell consists of two thin silicious plates in apposition, between which the transparent protoplasm and the colouring matter are contained. This vegetable colouring (endochrome) of golden hue seems to be formed of separate granules arranged somewhat radially in the centre of each segment. Such is the extreme transparency of this diatom that its outline is only with difficulty perceived even when the eye has been attracted by the bright splashes of colour. A detached segment may appear in outline something like an hour-glass, yet if caused to roll over, it will present a very different aspect. The twist appears to be equal in degree throughout. I have never seen more than five or six segments connected. Doubtless, fragility will account for the absence of a larger number in one band.

As there are difficulties in the way of submitting actual specimens to the inspection of readers, and lest it should be supposed that this diatom exists only in the realms of fancy, let me support my assertions respecting it by quoting from a letter sent me by Prof. P. T. Clève, of Upsala University, whom all diatomists will acknowledge as a competent authority. He writes: "The curious twisted form you mention I have seen in the material sent, in separate frustules only. It is evidently a diatom, and belongs to a new genus. The endochrome is perfectly that of a coccochromatic diatom." The name by which I suggest

STREPTOTHEGA TAMESIS.

that it be known is *Streptothega Tamesis* (twisted box from the Thames).

Such are a few of the many minute forms of life that I have found to be available for microscopic study even in the depth of winter.[1]

[1] All the diatoms except Lauderia Rhizosolenia and Streptothega are from Smith's "British Diatomaceæ."

# THE INCOMPLETE ADVENTURER.

BY TIGHE HOPKINS, AUTHOR OF "THE NUGENTS OF CARRICONNA," ETC.

"WHITHER ARE WE TENDING?" SAID THE CHEMIST, SOFTLY. "TO THE ENDS OF THE WORLD—TO THE RIM OF CREATION."

## CHAPTER I.—M. ROHAND, ARMAND, AND THE HERO.

M. ADOLPHE ROHAND, chemist and man of science, went slowly up the winding wooden stairs, steep, frail, and not too cleanly, which led to the attic where he had visited the Englishman earlier in the day; the echoes of the dingy Paris street growing fainter in his ears, and its emanations less pungent in his nostrils, as he ascended. It was the third week of May; the air of the narrow staircase was hot and impure, and old M. Rohand panted as he climbed.

On the top floor Armand, the patron or landlord, assistant fencing-master at Duclos' famous *salle d'armes*, a good-looking, thick-set, brown-bearded Provençal, of middle height, and about six-and-thirty years, received him, cap in hand.

"Well, and how is he going on?" inquired M. Rohand.

"Monsieur, he is as snug as a sword in its scabbard."

"It would have been impossible to put it more nicely," observed the chemist, with a smile and a slight inclination of the head; and he repeated the landlord's words to himself with leisurely relish, rounding the sentence off with a little flourish of his hand.

Armand bowed his acknowledgment of the compliment with a swordsman's grace, and led the way into the anteroom, a beggarly apartment, bare of all save the most indispensable furniture, and quite destitute of ornament, unless that term might be held descriptive of a pair of rapiers which glittered on the edge of a table.

Armand inquired whether the visitor would take *une consommation*, devoutly hoping, though for no penurious reason, that he would not.

"Thank you," said the chemist, "I take nothing stronger than coffee."

"For myself," replied Armand, "I cannot take much of it at night."

"Nothing would be more improper on your part than to do so," said the man of science, gravely.

"But one little cup is all that I ever take, monsieur."

"That can do you no harm in the world."

"Then, with your permission, monsieur, I will make two cups at once."

"I thank you a thousand times," answered M. Rohand.

The landlord bowed and withdrew.

Outside the door he took off his shoes, and M. Rohand heard him descending the bare wooden stairs in his stockings. Then he, too, rose from his chair, moved silently across the anteroom, and

stood listening at a door which conducted to an inner chamber. No sound reaching his ear, he pushed the door open and looked in.

Right opposite to him was a common stump bedstead, meanly furnished in the matter of bedding, whose occupant was a long-limbed, powerful young man, verging on the thirties. His long, thick, brown hair gave a certain fictitious distinction and appearance of strength to a face which had an irregular force and fineness of its own. The nameless quality of gentle birth which was stamped upon the features asserted itself above the marks engraven there by the "hard lean hand of poverty." The sleeper had thrust the bed-clothes below his chest, and M. Rohand observed that his nightshirt was much whiter and softer than the sheet above it.

"That was made for him at home," thought he.

A pretty morsel of muslin was draped about the narrow window, on the sill of which a tallow candle with a nodding wick burned with a wan and fading light, like a taper in a skull.

"He bought that himself," muttered the chemist, referring, not to the candle, but to the muslin. "Yes! And there's another token of home!"

His eye had lighted on a small and faded photograph, in a carved wooden frame, of a fair, matronly woman, plump and soft-eyed.

"If his eyes were open," said M. Rohan, "I could tell in a moment if that were his mother."

He went to the bed, which, by the way, was almost the only piece of furniture in the room, and bent attentively over the sleeper.

"The wound is nothing," said the old man; "it was the loss of blood that made him so faint. What I want to know is the effect of the powder. He should wake much better. We are going to see!"

Then the odour of coffee tickled his nostrils, and his ear was pricked by a faint chink of delf in the anteroom.

He went softly out of the bedroom, drawing the door close behind him.

"It has a beautiful smell," he said to the landlord.

Armand smiled pleasantly. "I made it myself. And when I make coffee, Monsieur Rohand, I know what I am making."

"I feel sure of that already, my friend," returned the imperturbable chemist.

"It is so, I assure you, monsieur; I am not a man to boast. As a fencer I am only pretty fair; but when it comes to making coffee, I have no superior. There may be others as good, but there are none better."

"I cannot permit myself to doubt it," answered the chemist.

"Monsieur is polite. I need not remind monsieur that there are ten species of the shrub, of which the most esteemed is a native of Arabia. I have been told that the flowers are of a pure white, but of short duration——"

"As to their duration, it is the same with the life of man," observed the chemist.

"Monsieur is a man of science, and knows what he is talking of," said the landlord. "These flowers, I have been told, are tubulous, and divided into five parts at the top."

"Now I wonder who told him that?" thought the chemist.

"Monsieur Rohand, it is the coffee of Arabia that you have before you. When you are leaving I shall ask you to examine the beans, for I am certain that you will recognise their genuineness at a glance."

"This man's talents are wasted in a fencing-saloon," thought the chemist, as he sipped the malignant mixture with unwrinkled lips. "Tell me," he went on, "has Monsieur Warwick slept quietly since I was here this afternoon?"

"Just as quietly as he is sleeping now. I think that was a good dose you put into him, though I am not given to praising medicine, which is sometimes a worse poison than the sickness you would cure with it—and that gives Nature a double job, you see."

The chemist smiled, and looked very well pleased.

"My medicine is my own," said he. "We shall see what it will do."

"He was very weak when we had him to bed," said Armand.

"I fancied him strong for a man who had lost so much blood from the arm."

"But you don't know his strength as I do. You should see him in the *salle d'armes!* He is like one of those performing fellows when he lifts the weights. There are those who would advise him to train for the 'variety' stage, but he would have knocked me over if I had suggested it. These English think so much more of their gentility than of art. Though, to be sure, he is not wanting in *esprit*, and I believe that if I could talk in the style that he does I could persuade him that there is a great, and even a noble, career in the big-weight business. You can marry money in it always. But these last few weeks he has fallen away a good deal. Shall I tell you what I think he wants?"

"He wants nothing but what I have given him!" answered M. Rohand, with a significant gesture.

"I hope we are going to prove that, monsieur."

"But tell me, my friend," pursued M. Rohand, "surely this is not his *métier* that you speak of?"

"If you come to that," replied Armand, "I think everything is his *métier*. He is, as they say, *homme qui fait tous les métiers*, or, in another manner of speaking, *homme à tout faire*, which comes to the same thing."

"Now that is very interesting," said M. Rohand; "but if I may without impropriety suggest it to you, his friend, M. Warwick's skill in all callings does not seem to have met with more than the proverbial reward."

"I must tell you," Armand answered, "that it is my belief he came a cropper here in Paris some years ago, and has never quite righted himself since then. What the affair was he has never told me, but one of the pupils at the *salle d'armes* said once that he had heard it was a failure in music."

"The first time I heard him speak," observed M. Rohand, "I was immensely struck by the admirable timbre of his voice. So you think that he failed in music? There can scarcely be any failure more saddening to an ardent youth; and

when at that age—for he must have been very young then, M. Armand—what is most relied on fails most surely, there is almost always some mark left upon the nature. But he seems of a sanguine temperament, and not one to pine for an irrevocable past."

"There you have him, *jusqu'au bout de ses ongles!*" cried Armand. "Pine! Not much!"

"That is well. And M. Warwick is now engaged in the practice of the foil at Duclos'?"

"He has been with us about five weeks. The only Englishman I have ever seen who fences as if it were an instinct with him, as the saying is. How it happened that he let me stick him in the arm to-day I can't imagine. You see, we had a little argument about duelling, of which, by the way, M. Warwick strongly disapproves. I wanted to demonstrate a particular thrust after the Italian School, and called in Italian *Stoccata di Cartoccio*, which was strange to him. We took up those rapiers there, having no foils to hand, and fell *en garde*; crossing our swords, as usual, *en carte*. I asked him to make a feint *de coup droit*. Slipping back with my left foot, and resting on my left hand, I made a half lunge, which took him unawares while he turned his wrist *de seconde*, and—well, that's how it was done, monsieur. But I tell you, I'm not well pleased about it, for he was very weak when we put him to bed."

As he spoke, there was a brisk and springing movement in the bedroom.

"Hullo, there! Armand, where are you? I want some drink."

The echo of the big vibrating voice made nothing of the slender partition between the bedroom and the anteroom.

"It is his old voice!" exclaimed the landlord.

"It is the medicine I gave him!" said Monsieur Rohand.

They went at once into the bedroom, where they found the patient sitting up on his stump bed, pale but energetic.

"Ah, M. Rohand!" he cried, "are you here again? It is very kind of you. I say, what was that you gave me this afternoon? You are a magician, I think, for I'm sure that is an elixir. Armand, *mon brav'*, ask M. Rohand what he will allow me to drink. You have been giving him some of that vile coffee; it is the most notorious compound I ever drank."

Armand, nothing abashed, shook his fist vehemently at the patient, and said that M. Rohand should see the beans for himself.

M. Rohand waved this debatable topic aside, with a delicate motion of his flexible white hand. The hand discovers age more unmistakably than any other portion of the body; but although M. Rohand's was the hand of an old man, it showed no signs of feebleness. He seated himself upon the bed, with a soft "Pardon," and proceeded to take the young man's temperature.

"It is excellent," he said; "you are already feeling greatly better, I think. You shall have some drink, of course; I will prepare it for you myself."

"What do you say to another dose of the reviver, monsieur? It is bread and meat and wine in one," laughed Guy Warwick.

A smile, mingled of pleasure and gratification, broke over the lean visage of the chemist, wrinkled the lips, which by this movement showed a set of even and well-preserved teeth, and stirred the grey hairs of his pointed beard.

"Ha! You feel that? Yes, I shall give you another dose of it immediately. M. Armand can perhaps find me a slice of bread-and-butter?"

"A slice of bread, monsieur? Yes, certainly."

"With butter," added M. Rohand.

At this, Armand began privately to wink and grimace at the patient, with an air of great discomfiture. Guy, his knees gathered up under the bedclothes, his elbows resting on them, and his cheeks in his hands, feigned not to observe these signals; but his large eyes twinkled as if in enjoyment of some secret joke.

"You hear, Armand?" he said. "M. Rohand wants a slice of bread-and-butter for the medicine."

Armand, however, rose to the occasion.

"Monsieur will not be offended," he said, addressing the chemist, "if I observe that we have no butter in the house. For a long time past I have impressed upon Monsieur Warwick that butter does not agree with him. It certainly spoils the muscle. As a man of science, monsieur will no doubt say that I am right."

The chemist, who appeared to accept this explanation in the best of faith, replied that the bread without the butter would serve his purpose.

"Then get the bread, *mon brav'*," said Guy; "for you see that I am desperately ill, and in want of sustenance."

Armand fetched a roll of bread and a clean napkin from a cupboard in the anteroom, and spread the napkin on the end of a high deal box against the bed. M. Rohand meanwhile had taken a small paper packet from a leather case in his inner pocket; and unfolding the packet, which contained a small quantity of a fine black powder, not unlike very small gunpowder, he laid it on the box, and cut two thin slices from the roll. With these and the powder he made a sandwich, which he handed to Guy.

"Eat that," said he, "and you will want nothing stronger than water to drink."

Guy swallowed his sandwich, and asked for another. M. Rohand made a second, which was despatched with equal gusto. Then Guy drank his water, and said:

"Now, what is this surprising powder?"

"It is the simplest thing in the world," answered the chemist.

"But what is it?" persisted Guy.

"That I shall tell you another time," responded M. Rohand; "and now be so kind as to hold out your arm. The bandage seems to be a little displaced."

Guy extended his right arm, which was bandaged from the elbow to the wrist. The wrappings scarcely concealed the beautiful shape of the limb, whilst they made more manifest its large and rounded strength.

"*Voilà*, monsieur!" observed Armand. "Is butter the food for a man with an arm like that?

No, no! If I had my way with him, I would feed him upon the blood of bulls."

M. Rohand gave a sudden start, and turned about and looked hard at the Provençal.

"What do you know of the value of blood?" he asked sharply.

"*Mais*, monsieur, it is the life; and I have been told that extraordinary things can be done by the infusion of the blood of animals into the veins of men."

"Certainly you have been told some very strange thing," returned the chemist, dryly; "but there are better and less gross ways of using blood than that."

"Monsieur is a man of science, and I am only a teacher of fencing," answered Armand.

Then M. Rohand went to work again upon the bandage, which had become a little loose. He unwrapped a portion of it, and looked at the arm.

"It does not pain you?" he asked. "There is no inflammation at all."

"It feels almost as well as ever, except that it's a little stiff," Guy replied.

"That is of necessity; but it will pass. It is healing beatifully."

"But how long shall I be fixed up like this? It's the sword-arm, you see, monsieur, and a man of my profession might as well be coffined at once as deprived of that."

"Well! I should think so!" put in Armand. "Monsieur here would not be worse off with the loss of his two eyes."

"It will be necessary to hang up the foil for a little while. That I must say. But not for long, I trust."

"Certainly not," said Guy, "or the powder is not what you and I know it to be—ha, monsieur?"

The old chemist smiled again.

"The powder will do its work, I hope," said he; "but, as I said before, there is no magic in it. And now I shall leave you for the night."

"I am enormously indebted to you," said Guy, as he gave his hand to M. Rohand.

"Do not speak of it, I pray," said the old man. "Apart from the pleasure I feel in having been of some little service to you, I have an interest of my own, which I assure you is quite selfish. To-morrow, perhaps, I shall ask leave to tell you more of that. And now, adieu. Sleep all you can."

And Monsieur Rohand took his cane and rusty hat, with the old-fashioned straight French brim, from the corner in which he had placed them, and bowed himself out somewhat precipitately, lest Armand should remember the coffee-beans.

"Sleep? Sleep all I can? No doubt! Does that good-natured old gentleman know us, Armand?"

"To-day I saw him for the first time," answered Armand.

"And I also," said Guy. "Then we may take it that he does not know us. Look here, *ma vieille branche*, put your eleven stone on the end of the bed and answer my questions. How many weeks' rent do I owe you?"

Armand held up three fingers without speaking.

"Three weeks? And I am ten days to the bad at the café. How much is there in the cash-box?"

Armand got up and took from the cupboard an old teacup, with a saucer for a cover. Turning it upside down, he counted the money on the saucer.

"Seven francs fifty," said he.

"And it will be a fortnight at least before I can fence again."

"I should say three weeks," returned Armand. "But M. Rohand recommends you to sleep."

"*Mon cher*," said Guy, "I shall not sleep comfortably to-night. The restaurant can wait; Père Berton has had his pickings out of me. But you are as hard up as I am, and you can't afford to house me *à titre gracieux*."

"*Assez, assez!*" broke out Armand. "The position is changed. The wound wipes out the debt. If there is a debt left now, it is from me to you. The rest we can talk of to-morrow. I am going to bed. *Bonne nuit!*"

"All right," said Guy, putting out his wiry hand. "*Bonne nuit!* We neither of us are poetical, and we won't affect sentiment. *Bonne nuit!* Wake me before you go out to-morrow."

## CHAPTER II.—"VISIONS OF GLORY, SPARE MY ACHING SIGHT!"

BUT Armand had been sweating a good two hours in his leathern doublet in the *salle d'armes* before Guy awoke.

It was M. Rohand who broke his slumbers, by letting fall his cane upon the floor; a piece of carelessness of which he had never before been guilty, and which annoyed him the more that he was just then engaged upon an essay on sleep in which he had set himself to establish that act as a proof of the divinity of the soul.

"*Ma vieille branche!*" began Guy, but seeing that the "old branch" was M. Rohand and not Armand, he changed his tone, and gave him a big-voiced welcome.

Guy had a twinge of scruple when he permitted himself to think of the doctor's bill, but he appreciated the old man's polite good-nature, was curious and enthusiastic about his mysterious medicine, and felt a spring-like freshness of pleasure in the making of a new and original acquaintance.

"And how are you this morning?" began M. Rohand, in a tone and with an air of more than formal interest.

"Oh, I am better than ever!" responded Guy. "Ever so much better. You are not going to keep me in bed any longer, I hope, monsieur?"

"I think you had better remain where you are for to-day, at all events. To-morrow I hope to have the pleasure of releasing you from your couch. Be so kind as to show me the arm. Yes, it is progressing in quite an astonishing manner. Your general condition is, as I think, excellent; and that, you see, is a great assistance."

"Well, I can't say that I have been pampering myself," answered Guy, with his rich musical laugh. "I am always more or less in training, because that happens to be something of a necessity with me at present. But in future, monsieur, I intend to live solely upon medicine. Now, whose medicine do you think?"

"Aha! Aha!" The chemist raised his right

hand with the fore-fingers uplifted, and smiled curiously, arching his eyebrows with an expression of mystery. Then he drew close to the bedside the black leathern portmanteau painted with Guy's initials, which was the sole substitute for a chair; and, becoming very serious, he said:

"Whether you jest or not I cannot tell; but this I can assure you, that medicine of mine, as you call it, does indeed contain all that is necessary to re-invigorate a weakened frame, and much of what is necessary to maintain life in health and vigour."

"There is no stuff of jesting in my thoughts, monsieur; I give you my word. What makes me so entirely curious to know more about this thing is, as I have already told you, that I myself am even now feeling its virtues within me. That is why I want you to tell me the mystery of it."

"I shall do so," returned M. Rohand; "but of mystery there is indeed none, save only the great and impenetrable mystery in which life itself is involved."

Here he paused, and seemed to lose himself in ardent reflection. Then he spoke abruptly, and said: "What a piece of architecture is the human skeleton! You call it ugly, and a thing to shudder at; but in its perfect adaptation to the ends it serves, there is not anything more beautiful. Then the muscles, so exquisitely modelled, clothing the bones, layer upon layer. The nerves next, to carry the bidding of the brain to the muscles. What mechanism for you! But what can they all do—bones, muscles, nerves—without sustenance? What sustains, what feeds, what nourishes them, *hein?*"

"The blood," answered Guy, wondering what this physiological discourse portended.

"You are right," said M. Rohand; his voice rising and growing more animated. "It is the blood. Did you perhaps observe me start last night, when Armand indulged us with the expression of his high belief in the nutritive and stimulating properties of blood?"

"I did; but——"

"Is it not blood that carries in its crimson stream the food of the bones, the muscles, the nerves, the brain, and every organ of the body? Is it not upon a strong and perfect circulation of this fluid that a high degree of mentality is dependent? Does it flow swiftly, with hissings and muffled roarings, and concrete quickly in a state of rest?—then it is all right with you! And what a difference there is between the liquids of the animal economy in animals of the simplest structure and those that are highest in the scale of being! The life-fluid of the former seems to be only water charged with a certain amount of organic particles. In the higher animals, the humours are of quite another nature; and there is one, distinct from all others, whose sublime destiny it is to nourish and sustain the body: it is the blood!"

"Still on the scent of blood, monsieur! Do you mean then to tell me that this substance here——"

"*Chut! Paix!* What have I said concerning this substance here? I insist that I have made no discovery; I have invented no elixir. But let me tell you a little story, M. Warwick. I am old, and childless, and alone in the world. That is nothing; my studies have absorbed the greater portion of my life, and have filled it almost to repletion—almost, but not quite. It is well, in the midst of abstract speculation, to keep oneself ever so little in touch with the human world; if not at many points, at least at one. To what end does the man of science work, if not to render happier the lot of his fellow-men? He, then, who loves most is likeliest (if otherwise capable) to achieve most for his race. I have only one love, apart from my work, but it has sufficed me for twenty years. Two years ago, my granddaughter, the only child of my only son, was wasting slowly before my eyes. The doctor told me that this vitalising fluid we have spoken of might save her, if she would but take it. I knew that he was right. But in its crude and gross form it was impossible to her; she was delicate, sensitive, and shrinking. To please me, she tried it; but it was useless, and she went on wasting. I will not see her in the article of death, thought I, and went to work, experimenting. For a whole year I experimented, working night and day. I had entered my science for a match with death. In the end—it was a year precisely—this powder here resulted from my labours. It saved Estelle, who has health now that neither riches, nor travel, nor medicine could have procured for her. Monsieur, I can let ambition slide; I have never entertained it; I am clear of it. Wealth does not entice me, nor fame. To have put back death from the couch of one I love is achievement enough for me. In a few lesser cases, I have added to my first success; but I have made no effort to draw public attention, and I and the doit that my science has wrung for me from nature remain unknown. But I am resolved of its worth, and am satisfied."

It was midday, and the chiming of clocks proclaimed it. Armand's step was heard upon the stairs. M. Rohand got up from the portmanteau.

"M. Warwick," he said, "I shall perhaps see you again in the afternoon."

"Come by all means, M. Rohand," answered Guy. "You have given me something to think about. I have a notion, and am going to develop it. Don't fail to come this afternoon; I shall have something to say to you. I see a great deal more in this than you have suggested. As for riches, good men have asked Heaven for them before now; yes, and dwelt secure by them when they had got them. Who is not disposed to abuse them, need not tremble at the prospect of them. . . . But I am more than ever puzzled to know the precise nature of this extraordinary reviver."

Armand entered as M. Rohand withdrew.

"*Mon cher,*" said Guy, "this fencing business isn't bad for bread and cheese, but it's not the thing to live by. Get out my togs. I'm going to balance myself on my feet. A very little of the perpendicular goes a long way to prove its unsuitability as a position for action. If I had spoken that in English I could have put it less clumsily. Don't give me the right leg of my trousers first; the left-leggedness of man joins with his right-handedness to attest his superiority in the animal world. I tell you, we are going to be enormously

rich. There is nothing like science. That chemist doesn't know how much he is going to do for us."

"He has dosed you with too much powder" said Armand.

"Wait till he doses you!"

"I'm afraid of magic."

"What, and a Provençal!"

"Yes; but a good Catholic too."

"Shave me, and say no more."

When M. Rohand returned in the afternoon, he found six feet one of enthusiastic impatience awaiting him. Guy, in a scarecrow suit, with his wounded arm in a sling, his heavy hair combed back from his forehead, and a long red scratch on his chin (the chief result of Armand's attempt with the razor, for his cheeks were very scrubby), was seated on the edge of the table, making passes at the wall with a rapier held in his left hand; and had something the air of a youthful and muscular Don Quixote.

"Why, you've been in the wars again!" said M. Rohand, pointing to the scar on Guy's chin.

"Yes, he's been carving me again. I let him shave me. The man's a sort of butcher. Sit down, monsieur, if you please. I am sorry for the scantiness of the furniture here, and—which is worse—what there is of it is not too sound; but if you will take that chair there—no, don't move it, please, it's safe just there. Monsieur, we are alone, and must have some profound and pregnant talk."

Guy had begun to pace the room, with large, impetuous strides, the rapier swinging in his left hand, and every now and then he made a motion as though he would comb his hair with it. Altogether M. Rohand was a little perturbed, wondering whether the effects of the powder were about to manifest themselves in some strange and unprofitable manner. The constraint of his position added to his disquietude, for after Guy's admonition he had not allowed himself to sit comfortably, and supported himself to some extent by leaning upon his cane.

"Now, M. Rohand," said Guy, "will you not tell me something as to the nature of this great balsam of yours? I ask for no secret at present; but give me some general knowledge of it."

"I have come prepared to do so," replied the chemist. "Here"—drawing a paper from his pocket—"is a little statement which contains all, except the secret of production. Read it, M. Warwick, read it."

Guy took and read the paper eagerly.

"Fee-Fo-Fum!" he exclaimed. "It is as I conjectured, but it is even more surprising."

M. Rohand rubbed his hands softly together and smiled.

After two or three turns in the room, Guy planted himself in front of M. Rohand, excitedly pricking a semi-circle in the floor with the point of the rapier.

"Have you thought," said he, "of the millions of our fellow-creatures who have claims upon you by virtue of your invention of this surprising concoction? All the weak, ailing, sickly, unfortunate, and poor-blooded of both sexes, in all climes under the sun, must hear of you. Did you not say this morning, to what end does the man of science work, if not to render happier the lot of his fellow-men? This, as the fruit of your labour, it is now in your power to do. What do you say, monsieur? Is it not a grand, a magnificent prospect? Will you tell me that two cures are enough for you? *Nom d'un chien!* I would have you strength-giver to the universe!"

"*Doucement!* Whither are we tending?" said the chemist, softly.

"To the ends of the world—to the rim of creation!"

"*Plaît-il!*"

"*Tenez!* You are not a whole believer in it, then? But no, I wrong you. The trouble is that you do not see, as I do, all that lies within it."

"Its virtues are there," said M. Rohand. "My satisfaction is in them; but to exploit them in the commercial sense—no, that is what I cannot do. We French have not your English gift that way; the genius of commerce is not ours at all. We have not the wealth of your capitalists, and we have not their money-making instinct."

"Wealth? Wealth is to be commanded, monsieur. Instinct? Leave that to me!"

The admirable politeness of M. Rohand permitted him never a smile; but it was droll in a grim way. Guy was so deplorably shabby; there was not a feature of him, save his brilliant eyes, that did not announce his aching poverty; and he stood there, jauntily confident, pricking with excitement, and swaggering like a buccaneer.

"I have thought it all out!" cried he, menacing M. Rohand with the rapier. "You will understand when I have explained it to you."

"*Tout beau!* my dear friend, I do not follow you. You lead me into strange ground. I am a poor old plodder in the humblest by-ways of science; what has such little science as mine to do with great commercial emprises?"

"*Pardon! Pardon,* Monsieur Rohand! Are not all the practical arts with which commerce is concerned grounded upon the abstract sciences? And here we have not to do with anything of abstract science, but with a ready-made invention, in which there is the possibility of wealth untold. Keep first in your mind the good that you are to do to humanity. That's a splendid thing in itself, of course; we're both agreed about that. But there's something else; think of all the money that is in it!"

"Money? Is that where you are, *mon ami?* But what do you mean?"

"I mean," exclaimed Guy, springing from the table, and covering the floor with a stride, his left arm waving wildly, "I mean that there must be thousands and thousands of pounds to be made out of this. It is a silver mine, a gold mine, a diamond mine. We must have a company—a powerful company—in Paris or London, with a chairman, and directors, and a manager—which, now that I come to think of it, would be the very post for me. The prospectus, a draft of which I shall make this very night, will draw the public in legions. The newspapers will write it up in ecstasy. We shall have our agents all over

the world. It will be called 'Rohand's Restorer,' or 'Guy's Reviver,' or something of that sort. I don't suppose there was ever such a rage for anything as there will be for this powder of ours. You, of course, as the inventor and the possessor of the secret of manufacture, will be vendor to the company. You must ask at least a quarter of a million in cash, and a million or two in shares. What I shall ask as managing director I don't know; but it is quite certain that our fortunes are made. Why don't you speak, monsieur? But perhaps you are too much excited by the thought of the stupendous future that is before you. Be calm, however, I beg of you. Take a pinch of the powder and a gulp of water. At a moment like this, with the wealth of continents almost within our grasp, it is absolutely necessary," continued Guy, who was now literally tearing about the room, "to keep in check those currents of violent emotion that set in the direction of the brain. But if you are really as excited as I believe you to be, M. Rohand, it would be better to explode at once, and then immediately regain your equanimity. Speak to me; speak, M. Rohand!"

M. Rohand, with fixed considerate face, sat placid in his chair.

"You have a gay and swift imagination, my dear friend," he said. "In the space of a moment or two you have sown this little powder of mine broadcast over the earth, and enriched us both with the profits of it. But your apples of gold do not tempt me. Once, perhaps, they might have done—though, indeed, I cannot fancy it. I am not vain enough to be ambitious, and alas! I cannot kindle my old embers at the fires of your enthusiasm."

"Courage, however! Courage, monsieur! I shall have you blazing yet. Ha! you begin to smoke a little already, I am sure. This benignant balsam, this peerless prophylactic, will overspread the Eastern and the Western hemispheres in an incredibly short space of time. Done up in small packets—on each of which will be inscribed the name of Rohand—and otherwise prepared in a variety of palatable forms, such as biscuits, lozenges, tablets, and the like, the demand for it will be such that we shall at first experience difficulties of no ordinary kind in meeting it. This, however, will presently be done to perfection through the agency of the great company which is to be established for its distribution. You shrink from the notion of a vast commercial undertaking (and there is no question that this one will be on a scale almost stupendous), you are not covetous of profit, you will not go down into the muddy pool of speculation. Monsieur, I honour you for those sentiments, and exhort you at once to sweep from the unsullied surface of your mind all thought and consideration of filthy dowlas. Leave those thoughts to me: I can entertain them without danger, and even contemplate them without abhorrence. Fix your mind firmly and entirely upon the nobler aspects of the enterprise. Let your fancy dwell steadily upon the image of a project commercial in its seeming purport, but destined in fact to bless mankind incalculably. What do I mean by that! I mean that the life-giver shall be sold at a ridiculously low price, which will bring it within the reach of the sickly, the weak, the unbraced, the prostrate, the moribund, and all who are on their last legs, or worn to the stump. The chairman of the company shall be a person whose heart is in the right place, who would rather give the healer away to the tottering pauper than announce a dividend at the annual meeting. I have not such a person in my mind, and it might not be easy to come upon him; but rest assured, monsieur, that he shall be found. The wide and weltering sea of mortal suffering shall be our element; the vessel we will sail it in is already secured to immortality as 'The Rohand;' and Pity on the prow and Compassion at the helm shall direct its course. *Eh bien, monsieur, que dites-vous?*"

"That I am lost in admiration of your eloquence, and as incapable as ever of believing in the golden future you have imagined for me."

"Then it remains for me to realise it alone."

Guy, still smoking, cast aside the rapier, and seated himself on the table, with an air of decision. He thrust his left hand into the pocket of his blue serge jacket with a gesture peculiar to him when he was altogether in earnest. There was a hole in the pocket, and his hand went through, and stuck out beneath his jacket. Guy contemplated his knuckles and did not care a stitch.

"Tell me, monsieur," he went on, "at what price do you value the secret of your invention? For how much will you sell it to me?"

The old chemist shifted on his chair, and very nearly came to grief in doing so. He recovered his balance with the aid of his cane, and looked curiously at Guy, his grey and straightened visage wearing an expression of amused perplexedness "This is quite serious, then,—*on ne badine pas?*

"Monsieur!"

"Ah! Pardon! Forgive me, M. Warwick!"

"The price, monsieur; the price of the secret?"

Again M. Rohand shifted on his chair, but this time more warily than before. His quiet eye took in the wretched appearance of the little ante-room, and returned with mild scrutiny to the long-limbed, buoyant, and beggarly figure of the Englishman, who conjured up millions at a breath, with a chasm in the pocket of his jacket. Was there a deeper magic in the powder than its inventor had suspected, and were these its manifestations?

One question after another entered the old man's mind. After all, the Englishman might be serious; he appeared, indeed (as he himself would have said), to be quite terrifically in earnest. There was no tempting M. Rohand to engage in speculative enterprises; his world and that into which Guy had sought to lure him were too widely sundered. But suppose he were to humour his imaginative patient? Then came the question, "But who is he? I know nothing of him."

Accordingly, M. Rohand threw out a delicate feeler on this important subject.

"Ah, to be sure," said Guy. "Monsieur, look at me well. Observe my attire. A moment ago I thrust my hand into my pocket, and, as you perceived (though you were polite enough to seem not to do so), it went clean through the bottom. I will

not ask you to scrutinise my apartment, for so observant a man as you are must have done that already. How have I come to this estate? What guarantee have you that I am not seeking to cozen your secret out of you, and then make of it what I choose; turning my back on you, my friend, my benefactor? Seven years ago I came to Paris, the most ardent and one of the most promising students of music the world had ever seen. I had the rudiments of a voice, monsieur, that would have shaken Paris—and after Paris, the world. I was to be a greater than Mario. Ah, monsieur, what you, and Paris—and the world have lost! Yes, and what I have lost too!"

Here, for one instant, there was a quaver, or perhaps only a semi-quaver, in the young man's voice; and he paused an instant with his large eyes wide open, and his lips tightly closed. Then he went on again at a headlong pace, and with all his old extravagance of tone and gesture.

"I had abandoned everything for music. With a voice like mine, it would never have done for me to waste myself on any other pursuit. Had I done so, Nature herself would in some way have exclaimed against me, and forced me to my destiny. So I practised, and practised, and practised. I ate and drank beside my piano, but I never slept over it. Enough; the day came when I learned that all had been in vain. I had toiled, well indeed, but not wisely. I had submitted myself to a strain that was no longer to be endured; my voice was going from me, even before I had proved it in public. Week by week it failed me, till at length I had to accept the knowledge that the Paris which I was to have taken with ravishment would never know me as a singer. Ah! what a bitter knowledge! It was then that the pillars of our planet seemed to fail me. As a singer of the second rank, I might still have tasted some renown; but I live in extremes, and scorned the concert-room. I have given lessons at a franc an hour, I have posed as model to an artist, and for some time past, monsieur, I have been fencing in a public *salle d'armes* on a stomach not too well lined. If you had ever fenced with lusty young men on an empty stomach, monsieur——However, you see I am sturdy enough."

"And your friends in England, monsieur, if I may venture to allude to them?"

"Ah! you are willing to believe that I have friends, Monsieur Rohand; yes, I have; but they—well, they know that I am in Paris; they will hear of me next as the promoter of one of the most extraordinary enterprises of the age."

"Monsieur," smiled the old man, "to humour you, since you are so bent upon this affair, I will agree to sell you the secret of the powder for five hundred pounds."

"What!" exclaimed Guy.

"I say," repeated M. Rohand, quietly, "I will sell it to you for five hundred pounds."

"Impossible! I will not hear of such a thing! Do you take me for a common robber? Multiply the amount by twenty, and I will then think of engaging with you."

Here M. Rohand, for the first time since Guy had seen him, permitted himself to laugh outright, a kindly and good-humoured laugh, but a little cracked, to be sure.

"No," he said, "the thousands shall be for another time. You think, then, it is so easy to promote such an affair as you talk of?"

"In a general way there are, no doubt, difficulties connected with these things; but with this—no, no. I walk into the money market, and am immediately surrounded by all the wealthiest and most honest capitalists it contains. My sole trouble will be in selecting them, and especially the one whose heart is in the right place, for the post of chairman."

"Well," returned M. Rohand, "you shall have your way so far as making the attempt is concerned; but I insist upon my price of five hundred pounds, and not a penny more."

There was some further talk between them: tempestuous, declamatory, full of exhortation, protestation, entreaty, and the noblest and most magnificent upbraiding on Guy's part; calm, orderly, and restraining on M. Rohand's.

Then they descended the stairs in company, and in the street they parted faithfully. M. Rohand returned home.

Guy mounted the stairs again with hot steps, forgetful of his slinged arm, and took from its hiding-place, at the back of the cupboard in the anteroom, the teacup which Armand had examined once before that morning. Its store had not increased since.

"Seven francs and a half," murmured Guy, with a tragic gesture; "it is my whole capital, but it will bring me limitless wealth." He dropped the loose silver into his pocket, and again descending the stairs, walked rapidly to the nearest telegraph office, where he handed in the following message:

"Please send five pounds. Urgent.—Guy."

This telegram was addressed to Mrs. Warwick, Deershott, Surrey.

### CHAPTER III.—THE CURATE LENDS FIVE POUNDS.

WHEN Mrs. Warwick received her son's telegram, she was considering how to sow two-shillings-worth of red-daisy seed to the best advantage. The red-daisy seed, the garden plot, and the garden itself, passed right out of her mind (I speak in metaphor, of course); and she dismissed at the same moment the question that had concerned her for a week past: whether it would be more economical to have the garden kept in order by contract, or to borrow the curate's mowing machine on Saturdays, and pay the hire of a casual boy.

"There's a shilling to pay on it, ma'am," said the messenger, handing the telegram over the hedge.

"Oh! then it can't be for me, I'm sure," observed Mrs. Warwick, staying her outstretched arm, for shillings were very scarce with her at that time.

"Dun'no, ma'am; but there's your name on it," returned the boy.

Mrs. Warwick took the telegram and turned towards the house, telling the messenger to wait.

"Now who can have sent a telegram?" asked

Mrs. Warwick, divided betwixt petulance on the score of the shilling, and curiosity to know the contents of the message. "Grace!" she called, "Grace, come here at once. Here's a telegram, and a shilling to pay for it; shall we take it or not?"

"Is it sent to us, Mamma?" said the young lady who answered to the name of Grace, putting out of a bedroom window a face whose features, though much softer and less strongly marked than Guy's, bore a stronger resemblance to his than to her mother's.

"There's Warwick on it," said Mrs. Warwick; then dropping her voice to a whisper, she added: "but the question is whether we've a shilling to spare."

"No, of course we haven't, Mamma," responded Grace; "but I suppose we must take the telegram all the same."

And they both went into a fit of laughter, and Mrs. Warwick opened the telegram.

"Well," said Grace, "what is it?"

"It's from Guy, and he wants five pounds!" gasped Mrs. Warwick.

This was serious; extremely so.

"Well, give the boy his shilling, Mamma—that's the first thing to be done. I've got one in my pocket; here, catch it, Mamma."

The shilling was paid, and the boy dismissed, and Grace came down from her bedroom, very nearly overturning in her haste the big pot of musk that was blooming luxuriantly on the table in the diminutive hall.

Mrs. Warwick had seated herself on her favourite bench on the small terrace facing the tiny lawn, the greatest part of which was overshadowed by one of the giant elms bordering the still country road that passed through the village of Deershott.

"What in the world can have happened to him?" she began, as Grace sat herself down beside her mother. "It must be something quite out of the common, you know, for he has never sent to us for money before."

"No," said Grace, "he hasn't; and so, by hook or by crook, we must send it to him, Mamma."

"Yes, dear, of course," answered Mrs. Warwick; "but the hook or the crook is just the question."

Mrs. Warwick knitted her smooth white brow, and turned upon her daughter a pair of keen brown eyes, with an expression partly of regretful doubt and partly humorous.

Grace looked at her mother with a very similar expression in *her* eyes, which were a shade lighter in colour, and a little less vivacious.

They had never quite made up their minds to consider themselves poor; living in the prettiest little retreat imaginable, in circumstances and amid surroundings which were entirely free from temptations to extravagance; visited by such society as that sequestered district boasted, and rarely called upon to make any but the most modest disbursements.

"We have not got five pounds, Mamma," said Grace.

"No, dear, we haven't."

"The garden will have to wait, of course. I don't think it looks so badly. We don't really want a man."

"I don't think we do, dear," said Mrs. Warwick, with the suspicion of a sigh. Her heart was shared between her children and her garden.

"How much money have we, Mamma?"

"I have four pounds thirteen. How much have you?"

"I have one and tenpence."

"We ought to get Uncle George's cheque to-night."

"That is as much as to say we shall not get it for another week."

"Yes," said her mother, "and we ought not to spend it in less than thirteen weeks."

"Mamma, did it ever strike you that we are outrageously poor?"

Mrs. Warwick glanced down at her costume, while cogitating an answer to this question.

"Yes, Mamma, I know that," observed Grace, following the direction of her mother's eyes. "But you must admit that we dress just a little beyond our means."

"Cambric is cambric, my dear," deprecated Mrs. Warwick.

"Yes, Mamma, but it wants a great deal of washing."

"It was only last week, dear," returned Mrs. Warwick, "that I made up my mind we must cut down the washing-bill."

"We might go into black, you know," said Grace; "somebody might have died."

"My dear child, there is nothing more extravagant than mourning. But we must make up five pounds for Guy."

"There's Mr. Craig," said Grace, lifting her eyes over the hedge.

"He has come for something," said Mrs. Warwick; "but I forget what."

"It doesn't matter what he has come for," said Grace; "he is the very man we want."

"His good nature is extraordinary," said Mrs. Warwick. "If we could borrow a pound from him, we could eke out the thirteen shillings till Uncle George's cheque comes."

"If we were only sure which of us he intends to propose for," whispered Grace, with a smile, as the curate slammed the wicket in the hedge behind him, and advanced along the path, "that favoured one might ask the loan without hesitation."

Mr. Craig took his hand from behind his back, and prepared to raise it to his expansive wide-awake. He was short, and smooth of face, and his frock coat, cut like a gaberdine, descended mid-leg. He had a smiling face devoid of features, and a rather long head, almost devoid of hair. He looked forty, and was verging on eight and twenty. He had been six months in the parish, and had trained a choir, and formed a cricket club out of the raw material of one of the least sophisticated villages in the county.

"Mrs. Warwick," he said, exposing a bald crown as he lifted his wideawake, "I never saw you and Miss Grace so idle before at this time of day."

I think this curate was doubtful which of these two ladies he loved the better. You may remember that Helen of Troy had but one rival, who was her daughter Hermione.

"We are not idle," replied the full and pleasant

voice of Mrs. Warwick; "we are busy and worried beyond everything."

"Your worries I beg to be permitted to relieve you of, and then you can go on pleasantly with the business."

"But it is the worry that is the principal part of the business," put in Grace.

"That's a nuisance," returned the curate; "but here I am, you see, free both of worries and of business; and," casting his eyes on the telegram, "I declare I don't believe I have seen one of those things for years."

The curate had a curious droop of the eyelids, which gave a slightly ridiculous expression to his small, good-humoured face.

"The telegram is the cause of it all," said Mrs. Warwick.

"Of course it is," responded Mr. Craig, with a chuckle; "I guessed that straight off, don't you know. I'll tell you whom it's from, if you like."

"It is from Guy," observed Mrs. Warwick.

"Yes, and he wants—oh, well now, I daresay he wants a hundred pounds at least. I should if I were in Paris."

"Oh! Mr. Craig," said Grace; "what would you do with a hundred pounds in Paris?"

"You shall not make him answer such a question," said Mrs. Warwick; "but it is not a hundred pounds that Guy wants, it is five."

"Which is the same thing, in a manner of speaking," responded Grace.

"Oh but, pardon me, not in a correct manner of speaking," said Mr. Craig, elevating his eyebrows with a smile. "I could lend a person five pounds myself; but if it came to a hundred—well, you might as well expect me to be the Mint. Meanwhile," added the curate, getting up from the grass on which he had seated himself in front of the ladies, and growing a little red, as he dived into his pocket, "there is a purse here with a five-pound note in it, which is very much at the service of our young friend in Paris. I am only astonished, if I may say so, at the exceedingly modest nature of his application. I have been told," he went on hurriedly, in his good-natured anxiety to cover the little awkwardness of the situation, "that there are places in Paris where it costs nearly as much as that to get your hair cut."

"It is really very kind of you, Mr. Craig," said Mrs. Warwick. "I am expecting my quarterly dividends every day from my brother, who is my trustee, when I shall be able to repay you. As for Guy, I don't think he will get his hair cut with it. I shouldn't be surprised if he were going to make his fortune. He always thinks he is, and I am sure that he will do it one day."

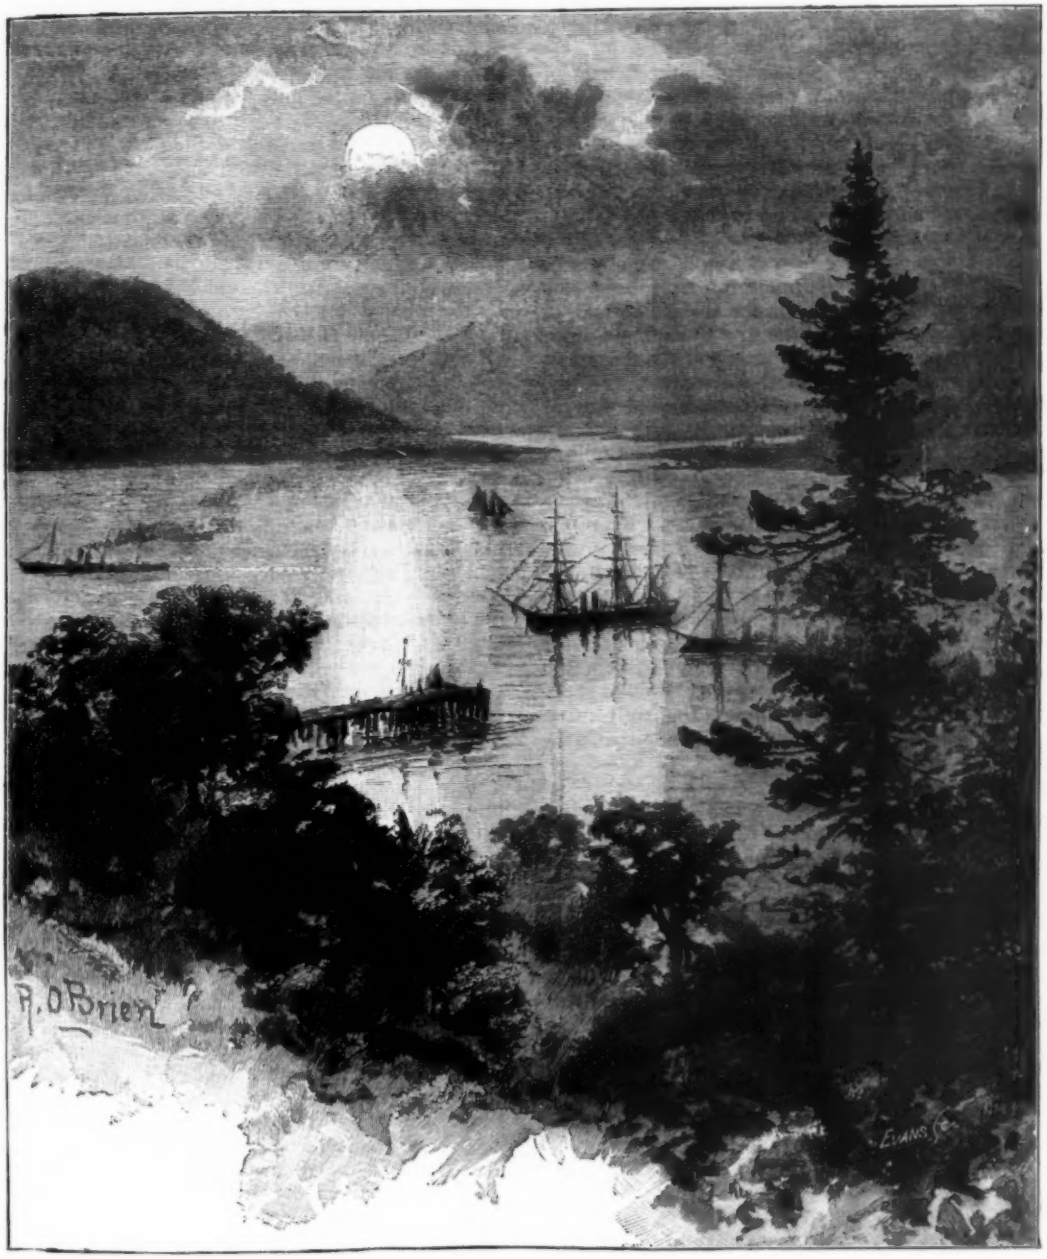
On the afternoon of that day, the letter-carrier who took up the Deershott post-bag at Miss Barton's universal village stores was admonished by that careful postmistress that it contained a registered letter for Paris.

"We must get Guy's room ready," said Mrs. Warwick to her daughter that evening. "I feel certain that he will be home immediately."

## It is Well.

A TRANSLATION FROM BERTHE DE CALONNE.[1]

No more I see thee, O sun of flame and glow!
  Yet feel the grey days' pallor all unsweet;
I have had pain; I need some gladness now.
No more I see thee, O sun of flame and glow!
  But I have thy heat.



No more I see the splendour of the rose,
  But God hath chosen each one's lot—content!
Not sheen, but soul of things for me He chose.
No more I see the splendour of the rose,
  But I have her scent.

I see it not, thy look that loveth me;
  The look I feel is on me. What of this?
It matters not; regret were blasphemy.
I see it not, thy look that loveth me,
  But I have thy kiss.

Closed are mine eyes, but what of shadow or gloom?
  Oh, too much light have I around, above,
For any darkness on my life to come!
Closed are mine eyes, but what of shadow or gloom,
  When I have love?

EMILY H. HICKEY.

[1] From the French of a blind and deaf poetess. The book *Dans ma Nuit* was reviewed, and this poem ("Qu' importe?") quoted in the *Spectator* of August 23.

ESQUIMALT HARBOUR.

FEW persons have a right conception of the magnificence of the six hundred miles of Canadian territory that form the first stages of the journey from Vancouver on the west to Toronto on the east. We question if it be surpassed by any highland scenery in the world. It is only five years since it was opened up to the public by the Canadian Pacific Railway. The Canadian Pacific is itself one of the wonders of the world; and whether or not it was a wise thing for a young country like Canada to undertake so vast an enterprise, it has done more than all previous undertakings to raise the colony, and draw to it the wonder and admiration of the world. Certainly, it

could have been no ordinary colony that dared to undertake a railway of more than four thousand miles from end to end, and that has carried it through hundreds of miles of country as rugged and wildly mountainous as if it had been heaved into existence for the very purpose of making a railway impossible.

For my part, I cannot concur in the remark of a fellow-traveller who professed to look with indifference on all modern railway engineering, because, he said, railway construction was now reduced to a mere matter of calculation—so many cubic feet to be excavated, so much rock to be blasted, so many bridges and viaducts to be built. That was the engineer's problem ; while that of the directors was very similar—so much money to be raised. Might not the same thing have been said four thousand years ago of the Great Pyramid, or yesterday of the Forth Bridge? Calculation, however accurate, would do but little without the genius that conceived, the skill that planned, and the patience and courage that executed these mighty works. The fact that the human spirit was not paralysed by the mere thought of carrying a railway across hundreds of miles of as rough country as the convulsions of Nature ever left behind them is a remarkable testimony to human pluck. No doubt the engineer has lately assumed a most useful partner—dynamite. Without tons of dynamite the task of blasting rocks would have been too slow to admit of his work being finished for perhaps half a century. But allowing for all this, allowing for the multiplication table, and for dynamite, and for the example of previous enterprises on a smaller scale, we cannot but hold to our opinion that the Canada Pacific Railway is one of the wonders of the world.

Most travellers from Great Britain move across Canada from east to west ; it fell to the present writer to take the opposite course, and travel from the Pacific to the Atlantic. It had been our fortune to spend two or three delightful months in California. From San Francisco we travelled northwards through those regions of picturesque glory—Northern California, Oregon, and Washington Territory. From Tacoma, the capital of Washington Territory, we sailed through Puget Sound, with its finely wooded shores and islands, reaching Victoria, the beautiful capital of British Columbia, after a day's sail. And in praise of Victoria we have not a little to say. It is charmingly situated on the western shore of the Pacific ; the water rolls gently into numberless little creeks and bays, and round many a wooded headland, with its play of life, and that bright smile in sunny weather that charms away all your dulness, if you have any, and makes you "rejoice with them that do rejoice." Esquimalt Harbour is one of the finest in the world, and seems to promise a wonderful future in connection with the trade to China and Japan, which has but recently begun, but begun with prospects of success that San Francisco is uncomfortable at the very thought of.

Perhaps some readers may need to be informed that Victoria is not situated on the mainland, but on the island of Vancouver ; and that Vancouver, the terminus of the Canadian Pacific, is not situated on the island of that name, but on the mainland. It seems a fantastic way of tumbling names about, but there is no end to the fantastic tricks in new settlements, many of which get their names while as yet there is no King in Israel. If you desire a pleasant sensation, walk on a fine day to the seaside, and from the cliff that overhangs the sea, gaze on the far-off range of the Olympian hills, with their snowy peaks gleaming in the sunshine, and the stretch of calm blue water between, the very image of purity and peace. The climate is charming, and there is hardly a trace of winter. A Scotch servant-girl thinks the seasons must run in a different order here from that which they follow at home, for she has reached March and it seems summer still. Victoria has profited greatly by the minerals lately discovered in its neighbourhood, and some of its citizens own fabulous wealth. Of one of the richest of them the story runs that one night, having slept on the ground, he observed in the morning that his hands were unnaturally black. It was coal-dust that did it, and it was a happy accident for him that it left its stain on his fingers, for the seams of coal of which he became possessed were vast and valuable, and they speedily made him a millionaire. A railway running through grand forests connects the capital with the coal region. Poverty seems actually unknown in Victoria. A clerical brother told us that he did not know how to dispose of the old clothes of his family. We cannot say that in every case great wealth has proved a great blessing, or that no cases have occurred of the old story of gold-bags sinking their possessors in the depths of evil, and becoming a curse.

But our business is to get to Vancouver, the terminus of the Canadian Pacific Railway. We board a steamer about midnight, and arrive at Vancouver in the morning. If ever a town was the offspring of a railway pure and simple, that town is Vancouver. Six years ago the country round was unbroken forest. On the completion of the railway in 1885 a little town was run up, but in June, 1886, a great fire reduced every house to ashes. When we saw Vancouver, it was a fresh, bright city of ten or twelve thousand inhabitants, with long streets, handsome warehouse blocks, elegant hotels, spacious churches, and snug pretty villas stretching away into the suburbs. One cannot but ask whether it has not been "boomed" more than is meet, and whether there will be no reverse of fortune soon to bring it down from its perilous elevation.

The neighbouring town of New Westminster is one of older date, although it is not many years since it got its present name. New Westminster is a great centre for the lumber trade ; it has vast sawmills, and an interesting sight it is to see how machinery can be taught to lay its fingers on vast logs of timber, and in an incredibly short space cut them up into any form that may be desired—from the rough batten to the frames and mouldings of doors and windows. And there is another famous industry at New Westminster—that of salmon-canning. Wherever fishing may have

proved a failure of late years, it has certainly not been at New Westminster. The salmon are caught in tens of thousands, and canned as soon as caught. Here, too, machinery does its part adroitly, sorting the fish and cutting them into lengths suitable for the can. But machinery cannot altogether dispense with human fingers. The workers in the cannery, which was most obligingly shown to us, were mostly Chinese and Indians. There is no concealing the fact that in packing the cans they handled the bits of fish very freely. Perhaps it is not wise to show the process to strangers, for it does not increase their love for canned salmon. But it was not an answer very flattering to our countrymen we got from the proprietor when we asked him why he did not employ more of his own people. He could not trust their steadiness or their regularity, he said, and the business was one that admitted of no delay. Whatever might be bad about the Chinese, they did not drink, and they came regularly to their work on Monday mornings. Is there nothing ominous here for the British workman?

We leave Vancouver at midday, going on board the Canadian Pacific Railway, and are speedily in motion eastward. And very soon we get a sample of the kind of country through which the engineer has to pick his way. For a considerable distance we traverse the ravine of the Fraser River. The road has seldom a chance of a level course, but is carried along sides of mountains, and over deep ravines, and through tunnels in solid rock, or is notched into the face of the cliff. The cañon of the Fraser is sometimes a gorge so deep that the sunlight barely reaches the dark and angry waters that struggle beneath. Already the picturesque form of the hills with their feathering of trees arrests our admiration, and as we get nearer to the heart of the mountains we are more and more charmed with the magnificent combination of mountain, forest, and stream, always changing, but always beautiful. Most persons have heard of the incredible multitude of salmon that frequent the Fraser. When you look at the black shoals that are moving up, hundreds and thousands in every little reach, you can almost believe the story of the man who said he had crossed the river by stepping on their backs! And you can understand very readily a tradition of the north of Scotland, that once on a time salmon were so abundant in the rivers there that domestic servants used to make a bargain with their mistresses that it was not to be given them for dinner oftener than twice a week.

These trestle bridges that cross the ravines every few hundred yards are wonders in their way. The forest furnishes logs in abundance, and the bridge is built up of logs horizontal and perpendicular, tier upon tier, till it attains the proper level. I have counted as many as ten tiers or storeys. No wonder they need to be carefully watched. A slight subsidence of the trestles at the foundation, or a slight dislocation at any part of the structure, would have very serious effects. There are hundreds of men constantly watching the line, and commonly a man at every bridge, so that the risk of accidents is comparatively slight. The truth is, there are so many bridges that the most nervous passenger would have to give up being frightened. No nerves will stand a shock every second minute; they must find rest in some form. And the best rest is just to trust that all is well; nor is this a very difficult attainment, since every bridge that you pass in safety affords a new security for the future.

After passing through the Fraser gorge for many miles, a strong steel bridge at last carries us across it, and after shooting through tunnel upon tunnel, we come on Kamloops Lake, and then the valley of the South Thompson River, a treeless region of farms and cattle-ranches. Peeps of the Shusweep lakes flash on us as we go, till plunging into another deep and narrow gorge we pass right through the mountains of the Gold Range, at the end of which the broad bosom of the Columbia River spreads before us. If the atmosphere had been clear, we should have had something to say of the magnificent snow-clad mountains which ought to be seen in the distance, but the dense smoke caused by the forest fires shut out that feature, one of the finest in the landscape, and compelled us to content ourselves with the nearer glories.

Crossing the Columbia River, we next encounter the famous Selkirk chain, probably the most magnificent of all the mountains of the province. We dash through another series of dark gorges, then begin to climb. The incline is too steep for a direct ascent, and we are compelled to proceed by a series of curves or loops all round the mountain slopes. The mountains grow in grandeur and variety the further we penetrate into them, till at length at Glacier Station we seem to have reached the very glory of glories. At the foot of "Sir Donald," a pyramid of native rock that shoots up to a height of nearly eight thousand feet, stands the favourite hotel, Glacier House, looking out on the great glacier of the Selkirks. The hotel is a favourite resort of tourists when they have a few days to spare. The glacier from which it derives its name is the largest in the range. Ascending a little higher, we reach a broad level area, surrounded by mountains of every variety of magnificent form, locked in the arms of the glacier, making us sigh, but sigh in vain, for time to loiter among them and become acquainted with their glory.

Descending the eastern side of the Selkirks, we pass along the Beaver valley, through more cuttings and tunnels, and light again on the Columbia River, which pursues a very roundabout course to the spot where we last left it. The broad valley of the Columbia separates the Selkirks from the range of the Rocky Mountains. The view of the two ranges, one on either side, their flanks clothed with rich foliage, but their summits shooting far aloft and wrapped in perpetual snow, is very grand. We pursue our unwearied course up the western slope of the Rockies, but before we reach the highest point we pause at a spot which has become pre-eminent for its beauty even in a region where there is so much to admire.

This is Banff, the great national park of Canada; for Canada is not to be behind the United States in the matter of a national park; and if the one has its Yellowstone and its Yo Semité, the other has its Banff. The name is insignificant; it ought to have been in three syllables at least, with a full rich sound, such as the Indians would have given it; but a railway director had sprung from the pretty little county town at the mouth of the Deveron in Scotland, and the great park of Canada was named after it—Banff.

The park embraces an area of more than twenty miles, by ten or twelve. The village at the railway-station is surrounded by an amphitheatre of mountains, range upon range converging to it or radiating from it, and affording so many outlets that, when good roads are constructed along them all, there will be an endless variety of walks and drives. Moreover, Banff is famous for its sulphur springs, which are said to be very efficacious in the cure of rheumatism; so that, in addition to its other attractions, it is becoming a sanitary resort for rheumatic sufferers. At one place the water, clear as crystal, fills a great natural basin in the limestone rock large enough to give swimmers a tolerable range; at another, it bursts from the ground so hot that you can hardly dip your finger in it. But to persons in full health the sulphur springs are little more than a natural curiosity; the great attractions are the scenery and the air. Nothing can be finer than to gaze from the balcony of the Canadian Pacific Hotel on the piles of mountains rising to heaven in every variety of striking form, the soft clothing of the pine forests below contrasting with the masses of bare rock above that seem to have suggested the name of the Rocky Mountains. For here, many a

"Ben-An heaves high his forehead bare."

The Bow River lends a great charm to the view, lighting it up with that bright look which relieves the gravity and solemnity of the mountains. Though as yet the park is barely five years old, some considerable drives have already been made in it. The furthest is one of about ten miles to the Lake of Miniwonga, a name that, in the language of the Indians, denotes the lake of evil spirits. It is hard to say what infatuation seized those who, in place of this fine name, called it the "Devil's Lake." The road to Miniwonga is partly along the Bow River; it passes a pretty cascade close under the hotel, and it would be a most pleasant drive but for ever-recurring bits of burnt-up forest, which have always a disorderly appearance, but, as an American friend remarked, will be put right by-and-by, when the housemaid has had time to do up the room.

We spent a few pleasant days at Banff, and greatly enjoyed the Sunday service in one of the churches of the village. When we left Banff, proceeding eastward, we soon reached the highest point which the railway attains in the Rockies—just a mile above the sea-level. The traveller has no choice but to do this part of his journey in the night. He loses the descent of the Rockies and the new town of Calgary, and in the morning finds himself on the edge of a measureless prairie. Before we emerged from the Rockies we had entered the North-West Territories, in one of which (Alberta) the national park is situated. The North-Western Territories are under a prohibitory law, with some few exceptions, and, though there are some grumblers, I think the general testimony is that it has been a great gain to the Indians, and likewise of service to new mining settlements, where strong drink has been wont to make such havoc.

When you leave the magnificent Rockies behind you and enter the monotonous prairie, life seems to become terribly dull. All is now flat as the ocean—no vestige of hill or dale. The soil has a thin sandy look, although here and there you see extensive enclosures that mark out certain large experimental farms belonging to the railway company, and which are under the management of Sir Lester Kay. What may be the result of this experiment we are unable to say, but as yet but little of the western part of the prairie is taken up. And the farmers do not get all the produce to themselves. That active and well-made animal the prairie wolf, that you see hovering about the yard, must have a fowl or a lamb should he find either about the place. But though the prairie wolf, the antelope, and other animals of the smaller sort remain, the buffalo is gone. A few years ago they were here in myriads, now not a hoof is left behind. Here and there along the line you see heaps of well-bleached buffalo bones, collected by the Indians as they roam over the prairie, to be turned into charcoal and used in the process of purifying sugar. And at some of the railway-stations you find groups of Indians, male and female, with their long black hair and coloured blankets, offering polished buffalo horns for sale. Times are changed since they roamed over the prairie in pursuit of the living animal, with a courage worthy of the children of the desert. It is humiliating to see them reduced to a miserable traffic in the dead creatures' bones!

Darkness falls again, and as there are no forests to kindle, our engine sparks must be content with the prairie grass. And a pretty sight it is, though not like the blaze of the forest. The grass is dry and the flame is bright, and when a puff of wind plays on it the flame waves and curls with great vigour along a wide extended line, giving a vivid idea of the destruction that must fall on every inflammable thing that is exposed without protection to its fiery kiss.

At daylight we are in the famed province of Manitoba, with its splendid soil and kindly welcome to farmer settlers. The thriving farms we pass on every side, the frequent villages and towns along the line, the huge "elevators" for storing grain, and many other tokens of prosperity, show that we have entered on a highly productive and attractive region. True, it is summer, and every one admits that the great drawback to Manitoba is its winter. Cold, very cold, it is undoubtedly, yet by no means intolerable. And what capabilities there seem to lie in that fertile soil which extends hundreds of miles in this direction and in that! Is it a mere dream that Manitoba is destined

to afford sustenance to ten or twenty times as many inhabitants as the whole of Canada contains to-day?

By-and-by we run into an ample railway-station, and on its signboard we read WINNIPEG, and when we emerge from the station we find ourselves in a delightful little town—no, we beg pardon, a spacious city, for it has streets a hundred and twenty feet wide, and its population is between twenty and thirty thousand. Its origin is but of yesterday—it is not yet out of its teens. When the capabilities of Manitoba were appreciated by the public, its fortune was made at once. Observe its gorgeous city hall, its banks and insurance buildings, its handsome churches and schools, all signs of prosperity. Not unbroken prosperity, indeed, for it has known somewhat bitterly that Fortune is a fickle dame. It could not be allowed to grow in peace. Those incorrigible gamblers, speculating capitalists, must "boom" it, running up the price of land to a monstrous figure, then selling it to "greenhorns," who are miserably swindled, and get a painful explanation of what is meant by "shearing the lambs." But Winnipeg is now recovering from this unfortunate experience, and we believe it will have a prosperous future. In no new city is there such a regard for the Sabbath or such a habit of church-going. And in the matter of liquor and licences it is also fortunate; a law that gives even a minority of the inhabitants in a locality the right to prevent the licensing of a saloon if they believe it to be fraught with mischief, greatly restricts the number of licences, and in a corresponding degree advances the order and prosperity of the place.

There are interesting spots about Winnipeg. There is Fort Garry, or rather a tall gateway denoting the site of the old establishment of the Hudson's Bay Company for collecting furs, before the spade or the plough was thought of in Manitoba. There is Kildonan, so named from a Highland parish in Sutherlandshire famed for its cruel evictions in the early part of the century, where a new home, very unlike the old, was provided for its expatriated Celts. There is St. Boniface, a French Canadian settlement, with chapel and school, college and hospital, where French is spoken, where the streets are all "Rues," and where, much to the scandal of the Manitobans, French is taught in schools, and the French language has the same privileges as in Quebec. It was when the Confederation was being settled that this was conceded to Manitoba, but the sagacious Manitobans now see in the arrangement a ruinous principle, and have begun a hard fight to withdraw the privilege. There is Silver Hill, the farm of Sir Donald Smith, with its herd of half a dozen tame buffaloes. And there is Manitoba College, where, true to their Scottish instincts and traditions, the early settlers established a seat of learning coeval with the foundation of the city. No man or woman from the old country, or from any country, would have cause to complain if Providence should cast his or her lot under the ordinary conditions in Winnipeg.

From Winnipeg to Port Arthur, on Lake Superior, the ride is through a prosperous agricultural region, on whose inviting features we have no room to dwell. Nor can we enlarge on our delightful sail over Lake Superior, in the course of which we were several times out of sight of land.

From Lake Superior to Lake Huron we passed through a canal, to avoid the rapids, and as we moved slowly along we had ample opportunity to admire the sunset, and the glory which the sun was throwing alike on the St. Marie Sault of the American side and the St. Marie Sault of the Canadian. The navigation is difficult, and we had to lie-to for the night. Morning found us on pretty Lake Huron, passing wooded shores and sunny islands, but as the day advanced the wind freshened, and we had a taste of what a great inland lake might become under the lash of a storm. But evening brought us to the shelter of the beautiful Georgian Bay, and at midnight we went ashore in prosperous Ontario.

For four hours we ran past rich farms and smiling farmhouses till we pulled up in the heart of Toronto. Description of so well known a city is superfluous; and we shall only say, in conclusion, that after traversing a region of such varied interest and beauty we can never regret the choice that made the Canadian Pacific the line of our journey from the west to the east of Canada.

W. G. BLAIKIE, D.D., LL.D.

# PRESENTED TO THE KING.

THIS nineteenth century in which we live is often spoken of by its critics as a very utilitarian age. Nothing is of much account, they say, which has not got some strictly practical end in view. The first consideration, when it is a question of embarking on any fresh enterprise, is, Of what use will it be?—or, with the more plain-spoken ones, Will it pay? Undoubtedly there is some truth in this accusation. Ours *is* a commercial age, and the commercial spirit affects everybody more or less, and is apt to colour our views of other things than those immediately connected with pounds, shillings, and pence.

In few ways, perhaps, does this characteristic of our times come out more strongly than in our estimate of the value of learning. Learning pure and simple, and for its own sake, has gone out of fashion. Everybody knows a little of everything nowadays. One learns just so much of any given subject as will serve his turn, and not a fraction more; and when the turn is served the learning acquired slides away like the proverbial water off the duck's back, and is presently forgotten.

Especially has the fashion changed with regard to those "fancy styles"—to borrow the hairdresser's phrase—of learning which were so dear to the hearts of a bygone age, and won their possessors so much distinction. Translations of the Bible into twenty, thirty, or forty different languages; Latin odes in celebration of some event or person of the day or hour; treatises discussing the uses of the divining-rod and the existence of unicorns and mermaids—these and kindred freaks of learning, the production of which were the effort and the glory of many a life, are to the present age mere childish follies, the pursuit of which would be an absurd waste of time. We have left them behind us with the samplers and the tapestry work on which our grandmothers expended their precious hours and still more precious eyesight.

One principal cause which has driven these studies and accomplishments out of court is the lack of time which is such a universal complaint at the present day.

> "What shelter to grow ripe is ours?
> What leisure to grow wise?"

are questions which, whether definitely put or not, still haunt all but the few who are either too lazy or too resolute to let themselves be drawn into the vortex. It was in country places, far from trains and telegrams, and in days before the penny post existed, that such pursuits found their students and their familiar haunts. They are crowded out of existence nowadays.

In the life of a family of whom some account was given, not long since, in the pages of this magazine, certain of these bygone and maybe unprofitable pursuits played a large and important part. When Mr. Nicholas Ferrar, having been driven from London by the great plague of 1625, settled with his mother upon the manor she had bought in the desolate shire of Huntingdon, and gathered his family about him, he devoted one of the rooms in his once "crazy" but now renovated house to the cultivation of a gentle art which demanded a considerable amount of skill and labour, although chiefly of a mechanical sort.

This apartment is described in Dr. Jebb's Life of Ferrar as "a long, fair, spacious room, which was all coloured over with green pleasant colour, varnished, for the more pleasure to their eyes, and a chimney in it for more warmth, as occasion served." This room was further decorated with texts and wise sentences, painted on the upper part of the walls for the edification of those who laboured there; so that, as George Herbert expresses it in his "Country Parson," "even the walls are not idle, but something is written or painted there which may excite the reader to a thought of piety." Conspicuous among these was Nicholas Ferrar's chosen motto, "Flee from evil and do good, and dwell for evermore;" and such wise saws as "Innocency is never better lodged than at the sign of Labour," spurred on the workers below to more ardent diligence.

This workshop was known in the Ferrar community by the name of the "Concordance Chamber"; and the work to which it was dedicated was the compiling of harmonies of different parts of the Bible, or of the whole Bible in different languages, and the binding of these and other books in velvet and leather, embroidered, stamped, and gilded, and finished off with "stately strings."

These harmonies, which were the pride and glory of Little Gidding, were most highly thought of in their day, and valued at very considerable prices. Their actual manufacture needed no more than industrious and skilful fingers and a considerable manipulation of scissors and paste; but the arrangement of the books required, in some instances, an accurate knowledge of the Gospel history, and in others a familiarity with four, twelve, twenty-six, and even fifty different languages! The "painful hands," as King Charles called them, which carried out the work were those of the seven Miss Colletts, the "virgins of Gidding," or the "Arminian nuns," as they were variously called by their admirers and by their detractors.

In size and shape these harmonies were mostly, it appears, a large folio. The leaves were made of a very stiff and costly white paper, and on these the letterpress—cut out of ordinary copies of the Gospels—was arranged in parallel columns, with fine red lines ruled between each column and all round the margins. The headings of the chapters,

titles, etc., were written in a small neat hand; and the pages were embellished with pictures, in many of which the backgrounds have been cut away with the most elaborate care, so that the blank leaf supplies the ground. During a long journey abroad which Nicholas Ferrar had made in his youth, he had laid in a vast stock of Scripture prints, Italian, Flemish, and German, from which supplies were drawn to illustrate the books. Part of the furniture of the "Concordance Chamber" consisted of a pair of presses, in which the sheets of the books, when finished, were rolled; and so powerful, we are told, were these machines that, when a page had been in their grip, "the whole looks as though it were printed on one uniform surface."

Special care was bestowed on the title-pages of the harmonies. They were variously decorated; with, for instance, a print of a wreath of flowers, delicately cut out, or with a ring of little pictures; and in the centre was a long and sonorous title, written out by hand in ornamental lettering. Here is a sample of how these title-pages ran. "The actions, doctrines, and other passages touching our blessed Lord and Saviour Jesus Christ, as they are related by the four Evangelists, reduced into one complete body of history; wherein that which is severally related by them is digested into order, and that which is jointly related by all or any of them is first expressed in their own words, by way of comparison; secondly, brought into one narration, by way of composition; thirdly, extracted into one clear context, by way of collection;" etc., etc.

These "patchwork harmonies," as a contemporary chronicler of the Ferrars contemptuously calls their handiwork, seem hardly adequate to have been the serious employment of a group of intelligent and well-educated men and women. One is inclined to be amused nowadays at these solemn old Bible picture-books, with their long-winded titles and elaborateness of arrangement; at the "harmony of all the prophets," which is to "confirm the Christian and convince the Jew;" at the Gospels in eight several languages, which are "so done and contrived for the use and benefit of all such as are desirous with sureness, ease, speed, and pleasure to attain to the knowledge of these languages." We cannot forbear smiling at the childlike simplicity and assurance with which they set forth their claims; the ends proposed are so vast in proportion to the means.

But in their day these productions were taken entirely *au grand sérieux*; and such became their fame that it reached the ears of royalty itself, as the Ferrars' friend and chronicler, Turner, Bishop of Ely, tells us. "The fame of this performance was so great that the King in his progress, lying at Apthorpe, seven miles from Gidding, despatched a gentleman, one of his servants, to entreat (which was the very word of that gracious prince) a sight of that concordance, which he heard was so great a rarity; promising to send it back again ere many days passed, after he should have perused it. Mr. Ferrar being at that very time, by an extraordinary necessity of business, called up to London, the family consulted, and concluded his Majesty's pleasure ought to be readily obeyed, though they thought so mean a piece unworthy the sight of a King. The gentleman, apprehending some demur about the delivery of the book, protested, if he had it not then, he knew the King before he slept would send him again for it." (Mayor's "Cambridge in the 17th Century," p. 266.)

This precious volume was not restored to its owners for several months, and when it did reappear was "apostilled" in the margin in many places by the King's own hand, and was accompanied by a request from his Majesty, "that he may have one of those books for his own use." "Whereupon," Bishop Turner tells us, "the gentlewomen set about it, and in a year's time (1635) they finished one for the King, binding it with their own hands after a fashion altogether new and extraordinary. Which being presented by the Lord Archbishop of Canterbury (Laud) and Dr. Cosins, the then Master of Peterhouse in Cambridge, the King admired the rare contrivement for the mechanical part within and without, and for the curious pictures, but most of all for the exquisite method that brought the gospel story into the most perfect harmony that ever was framed. After a full view he was pleased to say it was a present for the greatest king on earth."[1]

This very book, which was handled by Laud and extolled by Charles, can now be seen in the British Museum, and a curious and interesting relic it is of bygone skill and taste. It is a folio volume, massively bound in leather now nearly black with age, and tooled all over with delicate patterns in gold, a ring of little gold hearts surrounding the sacred monogram in the centre of the cover. The stiff pages within are no longer as white as when the virgins' fingers were busy upon them; the red borders have faded, and the written titles are sunk and brown with age. The "fine pictures" which so delighted King Charles are set about on the pages according to the fancy of those who handled the paste-brush, and often interfere greatly with the sequence of the text. One page is filled with little prints from pictures of the Virgin and Child another is headed, "To which are added divers other conjecturals touching His Infancy," and contains some dozen or more of small prints of allegorical and legendary subjects illustrating the holy home and childhood at Nazareth—*e.g.* Christ as a child carrying a basket of carpenter's tools in His hand and bearing on His shoulder the cross, spear, and other instruments of His Passion. Another represents the Saviour as a youth in the carpenter's shop receiving a vision of the cross brought down to Him by an angel; St. Joseph is at work at his bench, and in the background the Virgin Mother sits sewing. A very funny Flemish or German print, in a different group, shows us the three kings being warned in their dream not to return to Herod. There is a monarch in bed, with his crown on, and the royal garments on a stool at the bedside with the sceptre laid on the top; an angel is jogging him by the elbow. Through a

[1] According to Peckard's "Life of Nicholas Ferrar," it was Mary Collett who bound this book entirely with her own hands. Lovers of "John Inglesant" will remember her portrait in that book.

doorway another angel is bending over another king, who has his crown and sceptre laid on a little table by his bed.

Besides this very remarkable book the British Museum possesses two other specimens of the handicrafts of Little Gidding. One is a harmony of the Acts, dated 1637, also a large and dignified book "adorned with a stately garnish of pictures," but altogether less interesting than the one first described. The other is a concordance of the Books of Kings and Chronicles which owed its existence to a suggestion—not to say command—of the royal Charles himself. It was on the occasion of the presentation of the first book that the King suggested the second, and in the following words, according to the Ferrars' historian, Dr. Jebb:

"And then, turning to my lord of Canterbury, 'What think you,' said he, 'my lord? Shall I obtain a second favour from these good people? I have another suit to them: the matter is this. I often read over the lives and actions of the Kings of Judah and of Israel in the books of Kings and the Chronicles; the latter was a supply to the former, and in them I find some difficulties in the reconciling them together. I should desire that these good people would make me such a book as would bring these two books into one full and perfect history, and yet so as I may see them each several and apart at the same time to be read; they will easily understand my mind, I know. Will you let them know my pleasure?' And so, my lord's grace and Dr. Cosins assured the King it should be done. And intimation hereof being sent to Gidding, they presently fell to their work, which was completely finished in another year, bound up in purple velvet richly gilt, and by Mr. John Ferrar's own hand presented to the King, who in the meantime had often demanded when his book would be ready." (Jebb's Life, p. 268.)

This book was sent to the British Museum from Windsor by George II. It is a very large and splendid volume, bound in dark leather, stamped with gold lines. Within, the pages show signs of great care and skill in their general arrangement; and the handwriting of the titles, footnotes, etc., is far better than that of the earlier works. The red border-lines prevail, as in the earlier harmonies, but there are no illustrations. The date on the title-page is 1637.

The King received his commission with a delight that seems almost childish in its outspoken simplicity. "What," he cried, on seeing the Archbishop entering the room with "a stately great book in his two hands," "shall I now enjoy that rich jewel I have thus long desired? Have you, my lord, brought me my book?" When the volume had been laid before him and the lords in attendance had clustered round in attitudes of respectful admiration, Charles lavished his praises on his new possession in the quaint stilted language which was the fashion of that day, calling it "a diamond," "a most rare crystal glass," and vowing that it should be "my companion in the daytime, and the sweetest perfume bags that can lie under my head in the night." "And so," says the chronicler, "after some more talk the lords had of Gidding, the King took up the book, and went away with it in his arms."

One would naturally imagine that the harmony-making would have ceased at the death (in 1637) of Nicholas Ferrar, who was not only the founder and director of the Little Gidding community, but also its inspiring genius in every matter, whether religious or secular. But Ferrar was evidently one of those rare spirits who have the gift of training others, not only to need them, but also to do without them. His ardent soul had long dwelt in a most frail tabernacle, which every day must have given him warnings of its speedy dissolution; and he had made ready for his departure by training up his young nephew (another Nicholas Ferrar) to fill his place, as far as possible, when he should be called away. Young Nicholas Ferrar, who seems to have been in every sort a kindred spirit to his uncle, was the elder son of John Ferrar, and must have come to Little Gidding as a child of but seven or eight years old. This little lad was "entirely loved" by his uncle, who would not permit him "to be anywhere brought up but at Gidding, and under his own eye," so that all the most susceptible years of young Nicholas's life had been spent under the inspiration of one whose rare and beautiful nature must have been peculiarly congenial to his own.

The acquirement of foreign languages, ancient and modern, seems to have been the study towards which Nicholas Ferrar the elder especially directed the attention of his diligent nephew; "being," says John Ferrar in his Life, "a study that his wise, judicious uncle, Nicholas Ferrar, had put him upon, finding him every way fitted naturally for such knowledge." Hence, when a letter came to Gidding, some time after the elder Nicholas's death, "from a person of honour," saying that the Prince of Wales was very desirous of having a concordance made for him like the one which had been presented to his father, young Nicholas and his cousins, "laying their heads together, thought a concordance of four several languages would be most useful and beneficial and pleasant to the young Prince's disposition." (Life, p. 124.) *Our* knowledge, gathered from history, of Prince Charles's disposition would make us inclined to doubt whether any religious work, whether in fifty languages or in one, would have been in the least in accordance with it; but at any rate he seems to have followed the fashion of his day in treating the handiwork of Little Gidding with deep respect, and thought fit to pose as very desirous of possessing a sample of it.

The community, then, "uniting their heads and hands lovingly together," presently produced their offering for the Prince, in the shape of a concordance of the Gospels in "four several languages," embellished with "a score of rare pictures," and magnificently bound in green velvet.

When this work was completed and ready for presentation, it was thought fitting by its makers that "it should not go single and alone, but to stay awhile till Nicholas Ferrar, junior, had finished and ordered four other pieces of works, being businesses of many and several languages . . . . written

by his own hand and so composed by his head and industry." (Life, p. 126.)

The account of how these five "pieces" were laid before the King and Prince is given with much circumstance in John Ferrar's Life of his famous brother. Young Nicholas carried them himself to London (accompanied apparently by his father), and arrived there in the Holy Week of 1640. It was less than a fortnight before the meeting of the famous Short Parliament; and a few months only before the impeachment of Laud. The political atmosphere was full of storms; and difficulties of every sort were thickening round the unfortunate King. Such a scene as this of his interview with the gentle scholar enthusiast of Little Gidding is like one of those halcyon days which, by their strange beauty and tranquillity, forebode tempests to come. It is a fitful ray of winter sunshine, gleaming out with all the brighter radiance because of the thunderclouds which hang ready to swallow it up.

Young Ferrar, having reached London and placed himself under the wing of Archbishop Laud, was directed by him to be "in such a room at Whitehall" on the following afternoon, being Maundy Thursday. Accordingly, Nicholas and his box of treasures were in waiting when the Primate appeared. John Ferrar shall tell us of the introduction. "'Come,' said he (Laud), 'in God's name. Follow me where I go;' and led them into a room, where the King stood by the fire, with many nobles attending him. When the King saw the archbishop enter the room, he said, 'What, have you brought with you those rarities and jewels you told me of?' 'Yea, sire,' replied the archbishop, 'here is the young gentleman and his works.' So the archbishop, taking him by the hand, led him up to the King. He falling down on his knees, the King gave him his hand to kiss, bidding him rise up. The box was opened; and Nicholas Ferrar first presented to the King that book made for the Prince; who, taking it from him, looking well on the outside, which was all green velvet, stately and richly gilt all over, with great broad strings, edged with gold lace, and curiously bound, said, 'Here is a fine book for Charles indeed! I hope it will soon make him in love with what is within it; for I know it is good.'" (Life, p. 127–8).

This precious volume having been approved by the King, and the royal permission to present it to Prince Charles (who was then at Richmond) having, with much ceremony, been craved and received, it was restored to its maker, who, "carrying it to the box, took out of it a very large paper book, which was the fourth work, and laid it on the table before the King. 'For whom,' said the King, 'is this model?' 'For your Majesty's eyes, if you please to honour it so much.' 'And that I will gladly do,' said the King, 'and never be weary of such sight as I know you will offer unto me.'"

This book was the Gospels in eight different languages; and it was followed by "the fifth work," a part of the New Testament in no less than twenty-four languages; at the sight of which astonishing performance King Charles's admiration seems to have overflowed. "'What is this?' he said. 'What have we here? The incomparablest book this will be as ever eye beheld. My lords, come, look well upon it. This finished must be the emperor of all books. It is the crown of all works. It is an admirable masterpiece. The world cannot match it. I believe you are all of my opinion.' The lords all seconded the King, and each spake his mind of it."

The King next passed to wondering how "a young man of twenty-one years of age should ever attain to the understanding and knowledge of more languages than he is of years; and to have the courage to venture upon such an Atlas work, or Hercules labour." The court, in obedient chorus, re-echoed their monarch's astonishment, and said, "except they had seen, as they did, the young gentleman there, and the book itself, all the world should not have persuaded them to the belief of it."

A fresh idea seemed presently to have occurred to King Charles. He turned to the archbishop, and in a long-winded speech which it is not worth while to quote, half playfully suggested that perhaps after all this young student was less remarkable than he seemed to be, and did not understand all the tongues which were represented in his book, nor could "English them, word for word, properly." This suggested doubt put his kind patron, the archbishop, "somewhat at a stand," and he looked anxiously upon Nicholas Ferrar, "to see what he could say for himself in this kind." The young scholar, however, proved fully equal to the occasion. "Bowing himself to the ground at his Majesty's feet," he craved permission to produce "what will and may fully satisfy your Majesty." Then, stepping to his treasure-box, he produced another volume, which he had purposely concealed at the bottom of it, and gave it into the King's hands. This book was a copy of St. John's Gospel, also in the twenty-four languages, but with each chapter translated, word for word, into English or Latin.

"Lo!" cried King Charles, "here is an ample proof and manifestation, wittily contrived; and I am fully satisfied in all things. He could never have done this but that he is a master of them all." The lords echoed their Amen to this, in dutiful refrain; and the gentle student's innocent triumph was complete.

Royal interviews are apt to be short, and although this one must have been an exception to the rule, Nicholas was at length dismissed, "with a cheerful royal look" and a command to return "after the holiday" to my lord of Canterbury, from whom, said the King, "you shall know my good approbation of yourself and all you have done; and he shall signify to you my will and pleasure, what I will have you to do, and where you are to go."

We cannot here follow Nicholas to Richmond, whither he repaired on the following day (Good Friday), presented his offering to Prince Charles, dined with the Prince's tutor, Bishop Duppa, and "divers young lords," and was honoured with a long conversation with the Prince in the afternoon. But the sequel of that visit to London has a pathetic interest about it, and may be worth telling briefly here.

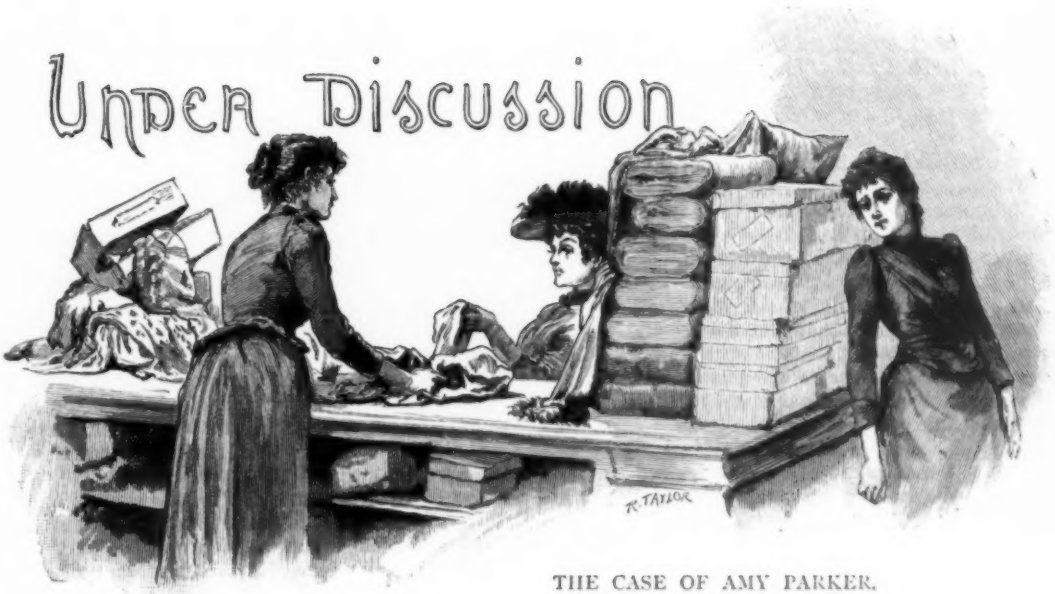
It was evident that young Nicholas's fortune was made. On Easter Eve he went with his father to

Lambeth Palace, to let the Archbishop know "what had passed at Richmond, for so he had given order;" and there Laud, taking the elder Ferrar aside, assured him that he need have no further care for his "hopeful son," either in the present or the future. "The King," said Laud, "will take him from you into his own protection and care, and make him his scholar and servant, and hath given me order, that after the holidays being past I should send him to Oxford, and that there he shall be maintained in all things needful for him at the King's proper charge. . . . Assure yourself he shall want nothing. In a word, the King is greatly in love with him; and you will have cause to bless and praise God for such a son."

Poor King Charles! It is hard to think how, had this young student lived to claim the royal promise, the King would presently have found the wherewithal to make it good; but a greater King, whose "scholar and servant" Nicholas had been all his life, had a different purpose for him.

One of those fevers which were always lurking about the close, ill-drained London of that day, had laid its deadly grip upon the lad. "On Easter Day," says the Life, "he was desirous (having found himself not well the day before) to receive the Communion at Paul's, whither he went early in the morning, and communicated; and, returning home, had little appetite to his dinner, eating little or nothing. He went yet to a sermon in the afternoon; but at night grew somewhat worse. And on Monday morning his father, with all care and diligence, went to a learned physician, who came and visited him and gave him what he thought fitting; but he grew worse and worse. Then was another physician joined to the first. They consulted, and prescribed things for him, but he mended not; but with great patience and cheerfulness did bear his sickness, and was very comfortable in it to all that came to visit him, wholly referring himself to God's good will and pleasure, only telling his friends, and the Bishop of Peterborough, Doctor Towers, that loved him dearly, and came to visit him twice in that short time, that he was in no way troubled to die and to go to Heaven, where he knew was only peace and quiet, and joys permanent; whereas all things in the world were but trouble and vexation, and death must be the end of all men, and that he that went soonest to Heaven was the happiest man." (Life, pp. 140, 141.) "Good cousin, are you not grieved to leave this world; you are now so young, and in the flower of your youth and hopes?" was a question to which he gave a cheerful and ready answer. "No, truly; I leave all to God's good will and pleasure, that is my best Father, and knoweth what is best for me." And the only thing which cast a shadow over his tranquil death-bed was the dark cloud of trouble and disorder which daily hung more threatening over the nation. "For then," says the Life from which we have been quoting, "tumults began, and the bishop of Canterbury's house at Lambeth was one night assaulted by a rabble of lewd people, which when Nicholas Ferrar was told one morning, as he lay in his sick bed, 'Alas! alas!' said he, 'God help His church, and poor England! I now fear, indeed, what my dear uncle said before he died is at hand, that evil days were coming, and happy were they that went to heaven before they came.'"

Could this gentle soul have foreseen what ruin and desolation the "evil days" were presently to bring to Little Gidding; could he have pictured the sacked chapel and plundered and deserted house, his lamentations would have been yet deeper. But for him the evil days came not, nor did the years draw nigh when he should say, "I have no pleasure in them." On the 19th of May, 1640, "God took him away, who died praying and calling upon God, 'Lord Jesus, receive my soul! Lord, receive it! Amen.'"



It may be of interest to mention that the Stuart and Tudor Exhibitions, held at the New Gallery, in London, in the winters of 1889 and 1890, both contained examples of the bookbinder's art as practised at Little Gidding. Among the treasures of the Stuart collection were a Bible and Apocrypha which had belonged to Charles I., bound by the Collett sisters in red velvet, and richly embroidered with the royal arms and other devices in coloured silks and gold and silver thread; and also another Bible of King Charles's, similarly bound, but, unlike the other, still rejoicing in a set of those "stately strings" of broad ribbon, edged with gold lace, which seem to have caught the royal fancy so much. This Bible now belongs to Lord Bute, and is a fine specimen of the Little Gidding bookbinding.

The Tudor Exhibition had a smaller but very pretty and choice example—a little book of prayers, or meditations, composed by Queen Katharine Parr, and bound—as the catalogue has it—by "the nuns of Gidding."

In the printed proceedings of the Archæological Society, there is an interesting paper to be found, by Captain Acland-Troyte (read January 26th, 1888), giving an account of all the still extant Little Gidding harmonies which he believes to be genuine, and about which he has been able to collect information. Of these he has discovered eleven (including one described by him in a subsequent paper, and the three in the British Museum); and as one of these was only brought to light two years ago, after the death of a lady who had had it in her possession for many years, it is possible that happy accidents may at some future time reveal other specimens of these remarkable old books, which may yet be lurking on forgotten shelves of libraries, or in musty cupboards of old family houses.

MARY E. PALGRAVE.

# Under Discussion

## THE CASE OF AMY PARKER.

BY THE AUTHOR OF 'VOICES FROM THE HIGHWAYS," "NOT BY BREAD ALONE," ETC.

"WHAT are you thinking about, Pleasance," I asked, as we two women sat together in front of the fire in our little snuggery, where we have our cosiest meals, and welcome those whose interests lie closest to our hearts. We are not sisters nor kinswomen, though we dwell together, and though nothing but death is likely to separate us. I loved Pleasance first for the sake of somebody else, who seemed to look at me through her eyes, and whose tones I often hear in her voice. I am a widow and she is a maiden, but we have each had our "story," though some commonplace people might not think so, seeing that we are both cheerful and comfortable in our middle age, and that Pleasance has the sweetest and gayest laugh I ever hear.

"What are you thinking of, Pleasance?" I repeated. And as she roused herself, she turned towards me a face so unwontedly grave that I instinctively added, "What is your trouble?"

"Ah," she answered, rather wistfully,

> "Only the troubles of others
> Cast their shadows over me!"

"That is a very big 'only,'" I echoed. "For my part, I never found any of my own troubles so heavy, and so weary as other people's are. I suppose that is because every trial has a consolation and a strength within it which outsiders can't realise. Or perhaps it is because we seldom concern ourselves much with other's woes, until woes of our own have worn off the edge of our animal spirits and energies. But who are the 'other people' at present, Pleasance?"

"I am thinking over the case of Amy Parker," she answered. "Oh, the pity of it, the pity of it!"

I felt my own face grow as sad as Pleasance's. "Is there any new development?" I asked.

"She was here while you were out this afternoon," Pleasance answered. "I should not know her to be the girl she was. If I had not known her before, I fear I should almost shrink from her now. But I remember what she used to be and might have been!"

"Ah, the Father knows that of everybody," I said, "and I incline to think there is no mere 'might have been' with Him, but always 'may still be' also"; and then I asked, "Amy has taken no situation yet?"

"No," said Pleasance. "I do not think she will ever take another situation. She is quite wrenched away from her old self. But she has got work—ill-paid and precarious, and ready to fail any day. Yet it is much to be thankful for."

Then we sat awhile in silence. Amy Parker was an old favourite of Pleasance's. She had been in her Sunday-class, and from the beginning Pleasance had taken special interest in her, on account of her pathetic history. Amy's father had been originally a clever working-man, whose talents had somewhat opened up his way in the world. He had married in the rather ill-defined class to which he had risen, a pretty, penniless girl, good, and ready to do her duty to husband and children. But she was of fragile physique, and utterly unable to cope with or face the situation, when his sudden death left her and three little ones absolutely unprovided for. She was ashamed to beg, her "education" was slight when put to practical tests, and for wash-tub, white seam, and other resources of humbler women, she was absolutely unfit. Before the terrible prospect, reason failed, and she became

the helpless inmate of an insane asylum, while the three little ones were distributed among somewhat reluctant relatives, scattered over the United Kingdom.

Amy, the eldest, fell to the care of the kindest among them, her mother's mother, then a neighbour of ours, dependent on a tiny annuity which would die with herself, but which, meanwhile, she was quite ready to share with her little grand-daughter.

It was thus that we first knew Amy.

We had some previous acquaintance with her grandmother, old Mrs. Spring, a gentle-mannered, cheerful body, who had found philosophy wherewith to face her own sorrows and trials, and whose little weaknesses we should never have observed, had not her relation to the little girl brought them into prominence. Mrs. Spring was of that temper commonly called "sweet," which is the very frequent disguise of an unreasoning and unyielding obstinacy. Now she clung tenaciously to her gentility—a good enough thing if kept in its proper place, subordinate to the real rights and needs of human life. She could not bear that her little Amy should run any risk of being confused with "working-class" children. I fear she scrimped her modest tea-table that Amy, even when quite a small girl, should never go without gloves. I fear she would have reared Amy up without any calling or trade, vaguely "trusting" that something would turn up before her own death should leave the girl to beggary. Possibly she would have thought there was pious faith in thus refusing to face the future, forgetful that "sufficient for the day is the evil thereof" does not imply negligence of present duty, but may rather be read as insisting on its cheerful performance, unhampered by doubts and fears. But Amy's father's brother, a plain north-country mason, and in manners rather a blunt hard man, interfered at this point. His wise insistence pained the old lady so much that Amy never forgave her uncle, and allowed her dislike for him to form a prejudice against his class, and against all the ways of thought first presented to her through him.

However, an opening was found for Amy's activity. It seemed quite providential.

Though our district is so near London, yet, owing to its being rather aside from the main railway line and not having yet started a branch line, it has retained some independent corporate life. It is true that our few "fashionable" families toil up to the "West End" to secure the newest "modes," but, owing to our modest little cottages being numerous, and their rents but moderate, we have attracted quite a little society of retired elderly people and thrifty and thriving young couples who are content to deal at local shops, where "one's ways are understood," and where the perilous processes of "making over" can be conducted almost under one's own personal supervision. One such shop was kept by an old lady and her young niece, who required just such further assistance as Amy Parker was qualified to give.

Mrs. Spring professed herself quite satisfied. The arrangement enabled Amy still to live with her, going and returning to her employment. It is true the hours were long, because the shop, to its elderly proprietors, was really parlour and reception-room. But leave of absence was readily given when asked for, for soirée or lecture, and every Wednesday Amy was allowed to depart in time to attend the meetings of a little local Literary Society. When customers were not actually to the fore, Amy and the niece sat, busy, at a work-table in a little recess.

Amy blossomed into a very gentle, gracious young woman. She was not a great reader, but she was always ready to be interested in subjects placed before her. She took an early morning class in our Sunday school, and was punctual and popular as a teacher. Moreover, she was evidently awakened to the fact that our work on the side of good must be done at all times and in many lines. Most of the customers whom she served were elderly ladies intent on their own "ways," or economical mothers desirous chiefly of what would "wear best." Still, even our quiet district was not without its little factory where worked a few rough girls, too apt, after the manner of their class, to waste money on useless finery. If any of these found their way to Amy's shop, they were at least shown the best value for their money, and persuaded to buy it. It was Amy's kind advice in some of these little matters which began a friendship between her and the orphan Bessie Day, in the course of which Bessie confided that she "would like to go into domestic service," only that "no lady would look at such as her," which ended in Amy introducing her to the notice of Pleasance, whereby Bessie is in our kitchen, one of the most painstaking and faithful maids we have ever had.

Alas! when Mrs. Spring died, rather suddenly, the even tenor of Amy's busy life was brought to a standstill.

It seemed to Pleasance and me that the girl's late employer was inclined to make re-arrangements which would have found room for Amy in her house as well as in her shop. But Amy had plans of her own. When she had first entered on her business life, her grandmother had remembered a former acquaintance who had been "head lady" in a fashionable millinery saloon. Mrs. Spring had brushed up the somewhat faded intimacy, and had taken this person's opinion on Amy's present and future. The ex-"head lady" utterly despised our local shop; it was, to her mind, entirely beneath a girl of Amy's talents and appearance. She was sure that her own influence could secure Miss Parker a far better opening at any moment, but Mrs. Spring would hear of nothing that should separate her grandchild from her. Yet she asked for and got the promise that when she died, the ex-head lady would do her best to promote Amy's interests. And Amy announced this to us, with a mild determination which reminded us of old Mrs. Spring herself. It seemed to have root partly in a natural feeling that it was dutiful to her dear grandmother to follow out the plans she had laid down, and partly in the consciousness that by doing so she would run counter to that objectionable uncle, who had yielded but a gruff approbation to her application even to such simple and serviceable "gewgaws and flummery" (that was what he called them) as she had dispensed in our local shop.

In all honesty, Pleasance was obliged to tell Amy that she did not think her determination wise in her best interests, and that it was contrary to the advice Pleasance would have given. But Pleasance found herself in a miserable minority. Everybody, even our rector and his wife, applauded "the young woman's legitimate desire to better herself." We even heard the quotation, "He that is diligent in his business, he shall stand before kings, he shall not stand before mean men." Nobody took any notice of Pleasance's meek observation that there might be varying definitions of kingships and of meanness! And I could not help recalling Mr. Ruskin's caustic remark that many of us are apt to send our young people into temptation under the name of "an opportunity."

When Amy realised that her representations and persuasions did not change Pleasance's conviction, I think she was vexed with us and felt us antagonistic to her, forgetting that it was she and not we whohad suddenly reversed our previous attitude. The approbation of everybody else convinced her she was right. (It generally does, though it is hard to know why!) And consequently, there was a little coolness about her during her departing days; yet she was a kind creature with sweet ways, and she made a bunch of the last flowers she was to gather from her grandmother's little garden, and brought it over to us.

Then away she went to a big establishment in a fashionable West-End thoroughfare. She might as well have gone to the ends of the earth for aught of her old life that she could carry with her! The "young people" employed with her were numbered by scores. They lived on the premises, and were, perhaps necessarily under such circumstances, ruled with that impersonal and martinet discipline that must always be applied to regiments. Nearly all came from country places, and had no exterior social ties beyond such as they might form haphazard for themselves. Amy had told us that her "hours" would be no longer than those to which she was already accustomed. But she had quite forgotten that there were no more goings to and fro to her grandmother's cosy meals; none of the business errands which had often formed part of her former informal duties, none of the old easily-obtained off-evenings. The customers were not of the old friendly sort, familiar in church and lane as well as in the shop. Most of these were lavish in their expenditure, while they were greedy of bargains; they were heedless of the trouble they gave; the beautiful, well-mannered girl before them might have been a wooden automaton for all the notice they took of her. There she stood from nine in the morning till nine at night, save when in her turn she retired to the stuffy dining-room, to snatch as much or as little of the contract food as her appetite could accept.

At nine o'clock she was freed—freed to stretch her cramped, aching limbs in the darkling streets, with such companionship as she found at hand among girls as jaded and excited as herself.

Sunday brought a little rest, but scarcely any real refreshment. Everybody was lazy, everybody was pre-occupied with finery. The services at the parish church were cold and ponderous, and how was one to resist an afternoon ramble in Hyde Park, even though it generally led to rencontres and repartees which did not increase one's self-respect?

The thought must have often come to Amy, "I am working to live, but is such life worth working for?" And then perhaps the question went deeper. "How is it that the woman who works from dawn to dusk never fares so well or wears so richly as the woman who idles away all her days: that the good things of the world drift apart from its workers to this man's extravagant wife or that man's expensive daughter—or, indeed, to those terrible women whom poor Amy learned to recognise among her most extravagant and exacting customers, women who made her acquainted with ways of speech and thought of which she had never dreamed, and over whose histories her fellow shop-girls often giggled, with scoffs that were strangely envious in their tone.

It is no use shirking these facts. These are the object lessons which in London stand daily before the face of thousands of thoughtless but still innocent girls. When we older and wiser people exhort such to beware of chance acquaintances, to be steady and quiet going, and to hold themselves aloof from all frivolity and flirtation, do we realise that, practically, we are asking them to be heroines and saints, prepared to forego all brightness for the present, and to face a future of loneliness and ultimate destitution? There are many, thank God, who can and do rise to such expectation, and the Father knows them and loves them, and writes their names down among His other martyrs. But has He no searching discipline for the state of society that treats such holocaust as a matter of course?

Alas for poor Amy! From her old happy life she had brought but a brighter face and archer manners and a more craving heart than had many of those about her—and alas! not altogether loftier aspirations, and by no means a stronger will.

What wonder that her pulse beat faster when she found herself observed and addressed by one whose handsome face, and winning tongue, and courtly way charmed her at once? It was so different from being snubbed by "the firm" and ordered about by the shop-walker. Yet it seemed only to restore her, from an insulting inferiority, to the natural position of her sex. He loved her: he said so; and of course he would marry her: why not? True, he was a gentleman's son; but her father would have made her a gentleman's daughter, if he had only lived long enough! "There would be no *mésalliance* in the matter," she said to herself, holding high her fair, light head, and thinking in the grandiloquent language of the trashy novelettes with which the tired girls were wont to amuse themselves. And besides, romance of this very kind was the typical legend of the order to which she belonged, the one wild hope shot across its grey reality: though what a will-o'-the-wisp it generally is, and to what dismal swamps it may lead, let those declare whose sad duties reveal to them the secrets of our Houses of Refuge, and of the hospital wards of our great unions.

And so for a while she walked in a strange, glorified mist, which shut out all the quiet, whole-

some joys and duties of the old life, even as it shut out all definite thought of the years to come. She could not remember, and she could not foresee! Such a mist rises sooner or later over most of our lives, but then not all of us are walking on a precipice over an abyss!

She could not remember! Yet perchance these old wholesome joys and duties laid gentle hands upon her from behind. For she made no deadly stumble where so many have utterly fallen. There came an awful day of revelation and humiliation, when she discovered that her heart had been but a plaything, and that it was now flung back to her lest its blood should stain the dainty hands that tossed it! There were women's spiteful tongues, there was a terrible outbreak of rage and pain and misery, there were proprieties far more outraged by this than they would have been by the decorous ruin of a soul, and then Amy found herself deprived at once of situation and home!

I think it was the last remnant of her native sweetness which saved her from the false pride which would have withheld her from us. It would not have been difficult to help her but for the damage wrought on her very nature. That gentle, sunny girl, ready to please and serve others, was transformed into the wild, hard woman. She could conform to no household ways, she could not control her powers of work, but would sometimes toil with terrible strength and then relapse into a dull, half-slumbrous lethargy. She had left off going to church; she often spoke bitterly as if she had lost faith both in God and man; and she cut herself off from all the ways of human intercourse except what were necessary to secure the pittance for which she toiled. But she showed a strange persistent craving for occasional interviews with Pleasance, from which she seemed to gain no benefit nor comfort, while they left traces of weariness and grief on Pleasance's face for hours and even days afterwards.

"I don't think I ought to be quite so sad about Amy to-day," said Pleasance, rousing herself from her reverie. "She has been speaking to me much more frankly than she has done before. She has given me a great deal to reflect upon. I think I can see what was the unbearable thing about her existence in that place. It had no unselfish aims; it was not really human. Souls must starve if they are offered nothing else but food and finery; and when they are starving, they go clutching after any garbage of a more emotional nature. Amy was telling me that the only girls who seemed ever able to avoid talking nonsense, and amusing themselves with worthless books and companions, were girls who steadily maintained some duty towards others beside themselves. One of these was regularly sending her mother half her salary, and another was a young woman who spent her hours after work—from nine till eleven, remember!—in mending and making for her brothers, young lads in city offices."

"I should think Amy could have found something similar to do if she had been inclined," I observed.

"Ah!" said Pleasance, "such work is always ready for eyes that are developed to see it and hands that are trained to find it! But this is rarely the case in our earlier years, when it is the order of nature that we should be receiving the very training and development necessary for this end. One can never get these satisfactorily where people of one sex, and of about the same age, aptitude, and status, are herded together. It is this which makes the very best of our Girls' Friendly Societies and Young Women's Christian Association Agencies and Homes (excellent as they are as adjuncts, and admirable as they may be in the warfare against certain evils) but poor substitutes for the old homely ways when the 'prentice or the workwoman had her share in her employer's small household circle, and enjoyed all the rights—including occasional frictions and frowns—of genuine home life. Sometimes I am almost afraid that these organisations may be used so as to cloke the evil of the growing tendency to swamp the individual into the mass. A girl leaves her own home in some remote town or country place, and her former teachers and friends, instead of surrounding her with their personal introduction and solicitude, are now apt to feel that it is quite enough that she belongs to such and such a society, whose local agent's duty is to look after her. But sometimes, who is looking after the local agent? She may be a fine lady, who spends months at a time in travelling, or who may have lapsed into semi-invalidism and be quite unable to follow up any girl who fails to give account of herself. I have known such cases. But supposing such agent to be all she should be, still a mere stranger, with a touch of officialism in her very position, cannot compare with some old 'friend's friend,' the influence of whose every accent and word is to keep the girl in touch with the best and tenderest associations of her life."

"Then what is to be done, Pleasance?" I asked; "I don't deny what you say—that the misuse of these schemes may actually tend to increase some of the evils they are intended to mitigate. But the old order of life has passed—or is passing. The desire of cheapness, and the habit of deriving income from investment in Limited Liability Trading concerns, have bred new methods of commerce, all tending to the huge factory or the vast store. And how are working girls and their friends to resist this state of things?—even if they are inclined—which many of them are not, for you must remember that Mrs. Spring herself had hankered after this promotion for her grandchild, and that Amy voluntarily accepted it."

"Ah, poor things!" said Pleasance, "we cannot expect such to be first in reconsidering values of things! They are surrounded by a public opinion which lays supreme stress on luxury, pays honour to idleness, and worships money as the means to these ends. Everybody who does not protest, both by precept and practice, against this prevailing public opinion, is doing his little utmost to forge these chains, which drag down thousands of lives into utter ruin! Against this force, what is called 'philanthropic effort' is but like the medical assistance called in, often too late, in acute disease. Public opinion itself, with its concurrent 'custom,' is as the diet and sanitation of the normal life, and we know that if these are bad, they

simply furnish the doctor with cases of sickness which his drugs alone will never restore to health!"

"And, of course," I admitted, "in many cases, there is no choice. It is simply a matter of being driven to seek work where work is. In a letter which came to me last week, there was a sentence which I think bears somewhat on this very point. The writer remarked that it seems to him that many of the so-called improvements in society have been merely changes in the appearance of the burden borne by the weak. And when one reflects over this, one sees that the terrible realities of tyranny and slavery have not altogether disappeared along with their names. Are there not in all large cities to-day many 'homes' quite as foul and as dreadful as the worst dungeons in which feudal lords immured their prisoners? Are there not lives wellnigh as powerless in the clutch of mammon as in that of Planter Legree himself? I begin to feel that we must regard all 'schemes' for the benefit of any particular class as mere cisterns of water set beside a path in a time of drought and ever liable to pollution or exhaustion. There is no security for the wayfarer's permanent refreshment save as the living waters of divinely implanted love and justice are set aflowing from human hearts."

"How many wrongs would begin to be set right," cried Pleasance, "if even those women only who believe themselves to be Christians would at once make a vital matter of conscience of their dressing, and their buying, and their expenditure! Why must they do all their shopping in big cities, asking only where things are made in the best style for the lowest rates, but never asking where the conditions of life are best for human beings? How often do we hear any establishment recommended because its workpeople are so well treated and so comfortable? We all cry out when a sad story reaches our ears, but how many of us seriously ponder whether any of our ways are helping to create sad stories? Are we zealous to search out from what sources our money is derived? If our dividends go up, do we scrupulously inquire how is this? Are we watchful to trace out the influences of our expenditures?"

Said I, "Nothing I have heard for a long time has pleased me more than a circular which came in the other day, in which a manufacturer sought to recommend his wares by describing the healthfulness of his factory and the pleasant surroundings of his 'hands'! It seemed to me like a straw telling the turn of the tide! If employers of labour feel that the public is as favourably observant of actions of consideration and kindness towards their employed, as it is of lowered prices or enlarged 'displays,' that will be the inauguration of a new order of things. The employers, of course, ought to do their Christian duty, whether they gain or lose. But still the duty lies first with the public to see that they do it, and then that they do not lose thereby."

"There are houses of business—all honour to them!" said Pleasance, "where much consideration is shown to the workwomen, a pleasant sitting room provided, furnished with piano and books. But, of course, the value of these things depends, after all, on the human influences which either supplement them or fail to do so. It is emphatically true that man, nor woman either, 'does not live by bread alone,' not even in the forms of 'comfort' and 'amusement.' The human soul can never be satisfied but with ways of life which lead to personal duty, to the interpenetration of mutual interests, to self-devotion and self-sacrifice."

"I suppose we should be told that all this 'is not business,'" I remarked. "Ah, the materialism with which Christianity has really to contend is not the materialism of sceptic philosophers; it is, as has been well said, 'the materialism that puts thinghood above manhood; that does not know that things were made for man, not man for things—that God gives us, not labourers to build our railroads, but railroads to build our labourers'—not women to make dresses and sell ribbons, but clothes and shops to train women!"

"But the radical reforms which will come of growing right thought everywhere must come, oh, so slowly!" sighed Pleasance. "And is there nothing that can be done at once by each of us as we individually wake to the realisation of these evils? You know that at every little light, even a farthing candle, other lights may be kindled."

"The real need," I said, "seems to be that these lives shall get opportunities of natural living. Now, I can't think it is natural that anybody should never be in the open air or able to enjoy exercise except after dark. Where young people are kept employed in great numbers till eight or nine o'clock, might it not be possible to allow them, by relays, some daily relaxation at more seasonable hours? Might not arrangements be made by which each should have, every month, one whole day 'off'? In such a huge wilderness as London this would enable many to visit homes and friends which they cannot even reach in their abbreviated 'after hours.' It is this lack, and this craving, which forms the excuse for our ever-increasing Sunday traffic, that subtlest enslaver which ever put out its hand upon the labourer."

"And speaking of Sunday," said Pleasance. "Do you not think the needs of these young people might be kept more in view than they are on that day? I don't think any household endangers its Sabbath rest and peace by admitting a 'stray' on that day; and the more regularly that 'stray' comes the better, as he or she will then have their own place in the household ways, and no risk of falling out of the exigencies of the household life."

"The worst of it is," said I, "there may be often some difficulty in bringing together the right household and the appropriate 'stray.' Of course, where there is prior personal tie of any kind, all is well. But some of these young people come up to great towns as friendless as if they came from the moon."

"Might not the churches take them in hand a little more than they do?" asked Pleasance, meditatively. "Why should not church organisation include some plain, pleasant room open between services, and under bright, sensible supervision, to make welcome strangers, and turn them into friends and neighbours? Members of the congregation might be invited to drop in, too; it would offer a field of service for those who have no aptitude for

Sunday school teaching. And I think it would be a blessing all round, for among older and well-established people there are many lonely souls, who suffer in their isolation quite as much, though not as dangerously, as do the young and struggling."

"I think I have heard of some effort of this sort," I remarked. "The minister had the room made as homely as possible with books and pictures, and there was a piano, and his daughter was there, ready to promote hymn-singing or any other plan for combined interest."

"There is something else I would like to say," said Pleasance, very earnestly. "It is that when any young person arrives anywhere, there should be no time lost in putting her in touch with good, friendly influences. I know many ministers, even, who are terribly dilatory in following up such cases. They take for granted too readily that the young stranger was not depending for welcome on them alone. Nothing should be taken for granted in such matters. It should be ascertained, by whoever has the chance of so doing, that the girl has at least one home-like opening into natural, happy life. And one such opening is often quite enough, for others will soon open from that as they do from real homes. There is even harm done by the fussy philanthropy which would multiply such openings to distraction. That only tends to dissipation."

"Yes," I said, "and that is where the girls' own good sense and feeling must come in to help them. If they would have friends, they must show themselves capable of friendship, and not merely ready to run after every will-o'-the-wisp of novelty and amusement. They must remember that their freedom is necessarily limited by their power to use it well. If arrangements could be made for afternoon exercise or the suggested 'day out,' they must realise the importance of punctuality and reliability, of discretion in manners and conduct. It is very sad, but it is true, that every class suffers through the misconduct and folly of its baser members."

"Oh dear me," sighed Pleasance. "I say again that when one sees how reform can only truly come by the growth of right thought and right action in so many people of such different kinds, one realises how slow true reform must be! And all the while there are people who must go on suffering!"

"Ay," I assented, with an indrawn breath. "But remember, after all, suffering is not the worst part in life, for in it we are made partakers with Christ. It is the making others suffer which is the evil that has no consolation! Any who find that to win honest bread they must accept something very like martyrdom, may remember that, by patience and courage and cheerfulness, they have it in their power to win also a martyr's crown! Independence and honesty are as precious in God's sight as many of the truths for which confessors laid down their lives. Therefore, to be called on to suffer, and even die, to secure these, is no mean destiny! But it must be for independence and honesty—in the struggle for necessary bread, and not to secure an extra ribbon or to gratify a vain wish to be 'genteel.'"

"Yes," said Pleasance, "every day I see more plainly that the growth of 'the Kingdom of God' rests with the determined individual endeavour to do the right thing in each individual case. The same 'facts' do not mean the same things at different times, in different places, and with different individuals! We may heap up statistics, and plan philanthropic organisations, or secure legislative enactments, but, after all, the only value any of these things have, lies in the number of individuals within them who are honestly striving to press home on every occasion the great Christian principle, 'Do unto others as ye would that they should do unto you.' It seems to me that under the influence of that law, problems of human life now so intricate that they can scarcely be stated would gradually resolve themselves into utter simplicity. And it seems to me, also, that there is no other way to master them, and that any such attempt is only loss of time and further waste of human pain. See! this principle at once gives us something to go upon in our bewilderment over the case of Amy Parker. If we were in her place, what do we think we should like done for us?"

"If I were in her place," I said, "I think I should like to be helped to busy, stirring work in quite a change of surroundings, and of a kind which would not draw other people's attention on me, but would insist on my taking a good deal of interest in them. When life breaks us up as it has broken her, we can scarcely be mended; we must generally be made into something new!"

"I wish she could see it was her duty to begin again, just where she left off, only wiser, if sadder, by experience. But it would require much strength of character to do this successfully, so that I am not sure we have the right to demand it of another," mused Pleasance. Then she looked up with a question in her face. She said:

"Can we find a niche for her in Mr. Bryant's emigration party?"

# "YANKEE DODGES."

NO disrespect for the great nation over the water is intended by the above title—quite the reverse.

The word "dodge"[1] is used as signifying a clever contrivance or a neat way of getting over some natural obstacle, and the number and ingenuity of such "dodges" in America must excite our admiration.

The following papers are a product of but a two months' visit to New York, and can therefore only deal with the matters which first impress a stranger —with things more than with people.

The first word in the title I acknowledge is inadmissible, since the New Yorkers are not strictly speaking "Yankees" at all, that cognomen being the exclusive property of the New England States.

Nor, perhaps, is New York even a characteristic *American* city, owing to its cosmopolitan nature: "Cosmopolis," it has been called. Germans and Irish form a very large proportion of its inhabitants.

Still, as few, if any, of the dodges one sees in New York are met with in the Fatherland, and certainly none of them in Ireland, one is forced to the conclusion that the American-born New Yorker is answerable for most of the clever contrivances and schemes of which his city is full.

To study American *character* one should perhaps go to a more exclusively American town, but the results of the national *inventiveness* are probably as well exemplified in New York as in any other place in the States.

To people who have been in America these pages will have little interest, since they only describe those things which the most casual visitor must notice and remember, but which none have yet thought worthy of much description.

American politics, social life, and religion have been described again and again by men competent to speak of them. The natural resources of the country, its rivers, mines, and manufactures have also been written upon by those who have had time and opportunity to collect information. Men who have spent years in travelling in the States have written far more fully and ably than is possible to one who was merely a business resident of New York for two months; but their books contain few "dodges," for they ceased to notice the little things which were at first new and strange, but which, by constant usage, they came to take as matters of course. We at home have learnt all about Minnesota wheat-growing, and the progress of democracy, but little about the trivialities which a visitor first notices, and which cause him to feel at once that he is in a strange country.

There is something novel and curious to an Englishman in everything he sees in America. All bears the mark of ingenuity—of an ingenuity untrammelled by custom or tradition. I venture to hope then that those who have not crossed the Atlantic may feel some interest in an unpretentious account of what first interested a stranger, while those contemplating a visit may perhaps be saved the humiliation of expressing or showing astonishment on their first arrival in a country the natives of which are never astonished at anything.

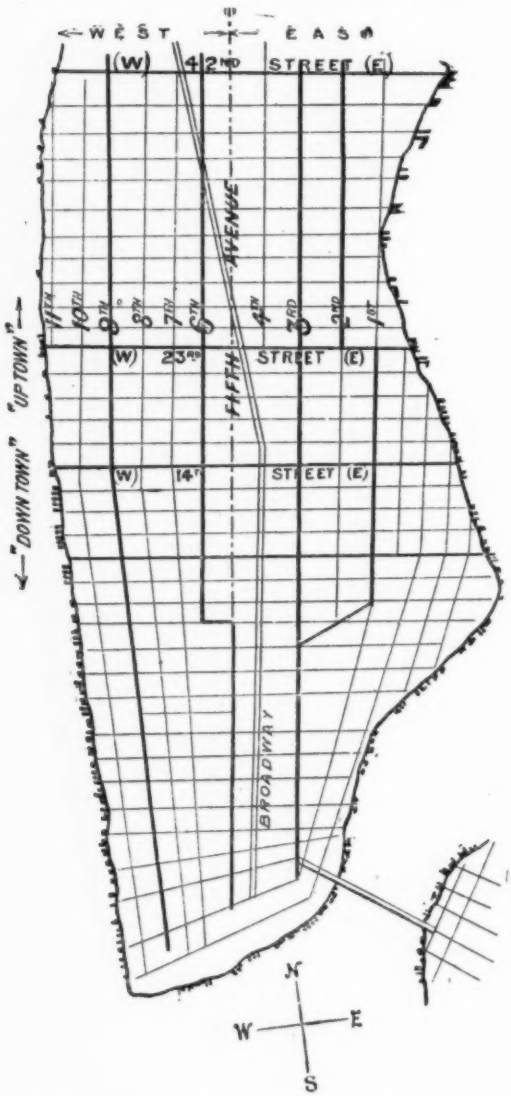
## I.—TRAVELLING AND COMMUNICATIONS.

One of the leading ideas in the American mind is to "get there." It is not as a rule a patient mind. In America there are comparatively few scientific investigators and discoverers (the Lick Observatory notwithstanding), while inventors swarm; research interests them chiefly as it leads them to their goal.

It will be surmised from this that travelling in the States is made easy and rapid. New York, for instance, is one of the most convenient cities in the world to get about in. Its geography has been made so simple, that a stranger can find his way anywhere after a short study of the map, while the means for conveying him to his destination are many and rapid.

The town is built on a wedge-shaped island (Manhattan Island), about fifteen miles long and two miles wide in the centre. This is traversed lengthwise by, roughly speaking, twelve "Avenues," numbered consecutively from the east side. These avenues are crossed at right angles by streets, numbered consecutively from the south or "down town" end of the island.

The space enclosed between the intersections of two adjacent avenues with two streets is called a "block," and is of course filled with houses fronting both avenues and streets. Each block contains twenty houses (or numbers rather) on its avenue faces, and one hundred on its street faces. Owing to the difference in the size of the houses it generally happens that all the twenty or one hundred numbers are not required; but whether this be so or not, the first house on the next block up the avenue will carry a number twenty above that borne by the first house in the last block, while on the street face the numbering of every block will commence with an even hundred. This reads rather like a riddle, but the little sketch which shows four blocks containing different numbers of houses will explain it. It will be seen that one corner house on the avenue face of one block is numbered 400, and, although there are only twelve houses in that block, the corner house in the next block carries the number 420, and so on, on the street side.

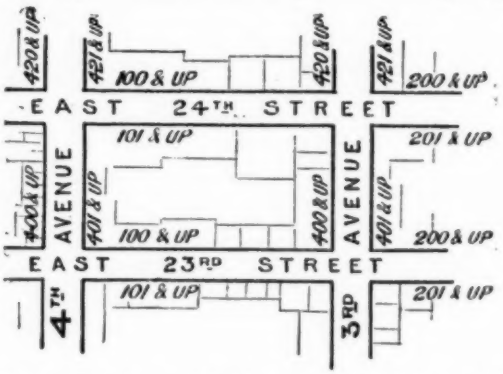


[1] The word "Dodge," originally only used as a verb, has of late years come into use as a substantive, and has acquired another and more pleasant meaning than its first.

Once it almost invariably had a sinister application, witness Dickens's "Artful *Dodger*," and Antony's speech, when, after Actium, he complains that he must make what terms he can with his conqueror, and "*dodge* and palter in the shifts of lowness."

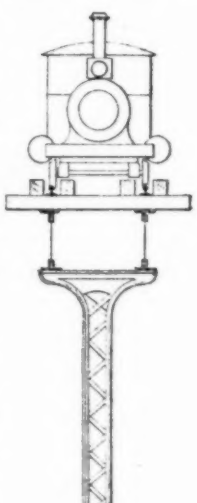
Now, however, when used as a noun it is not always in a bad sense; we often speak of a "good dodge" or a "clever dodge," and mean thereby a successful eluding or overcoming of some difficulty in a neat and simple way. Thackeray says, "Some who have a taste for good living have many harmless arts, by which they improve their banquet, and innocent *dodges*, if we may be permitted to use an excellent phrase, that has become vernacular since the appearance of the last dictionaries."

It is in this later sense I desire to use the word.



The central Avenue (Fifth), shown by a dotted line on the map, forms a dividing line between the East and West portions of the Streets, and the street numbers start from it in each direction. Suppose a man wants to find 419 W. 13th Street. He knows it will be four blocks and nineteen numbers along thirteenth street west of Fifth Avenue, that is, between Ninth and Tenth Avenues. If he want 1137 Sixth Avenue, and happen to be standing opposite

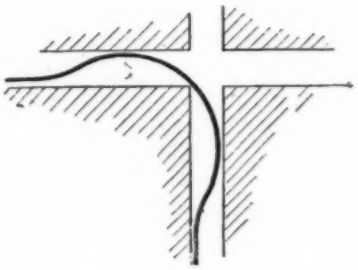
No. 37 on same avenue, he knows ne has to go $\frac{1100}{20}$ or 55 blocks up the avenue—and takes a car.



This "block" system is carried out in all the large towns, and could only be employed in a new and rapidly grown country; in Chicago it is very perfect, as after the great fire the city was most methodically laid out. It is more romantic to live in "The Limes, Beechwood Terrace, Walnut Road, S.W.," than to have as one's address plain unvarnished "Number 27 W. 110th St.," but the stranger does not always appreciate the romance in finding his dark and lonely way to the aforesaid "Limes."

Having arranged his city so that he knows exactly where any house in it is, the New Yorker has supplied himself with ample means of getting

there. He is so "fixed up" with railways and tramcars and elevators that he never need walk a hundred yards, nor scarcely ever ascend a staircase.



Along four of the New York Avenues—those shown in thick lines on the map—run the elevated railroads. These remarkable structures are peculiar to New York, and there is nothing else like them in the world, although there is soon to be one at Liverpool. They run along over the streets about on a level with the first-floor windows—sometimes over the "sidewalks" and sometimes over the roadway. There was great opposition to them at first, not so much from the first-floor-window people, whose privacy and outlook were lost, as from the horse-car companies, whose dividends were threatened. Some horse-cars (i.e. tram cars) were built with an upper storey in order to demonstrate the impracticability of putting any structure over the street; but the City government decided for the railroad, and the car people had to cut their vehicles down again.

As engineering works the elevated roads are rather striking. Each train consists of about five cars (each car about 40 feet long, and constructed, like all American rolling stock, on the "bogey"[1] principle) and an engine, and the road is supported on what look very slender wrought-iron columns. In many cases the up and down roads are braced together, but on some avenues, notably on Ninth, they are not connected, and look somewhat top-heavy, as the accompanying section shows. The curves are terrific, as the road frequently turns a street corner, and New

[1] A vehicle carried at each end by a four-wheeled truck, pivoted to allow easy travelling round curves, is said to be built on "bogeys.

York streets are not very wide. The line is "bulged" at such places to make the curve more easy, and is stiffened sideways by an outer line of columns and girders.

The fare all over each line is the same—5 cents, or 2½*d.*—and there is only one class, for all are equal in America. You take your ticket as you enter the little station at the top of the steps which lead up from the streets, and drop it into a glass box as you step on to the platform, and that is the end of it as far as the passenger is concerned. You can then ride wherever the train will carry you, and are never bothered to "show your ticket," and thus avoid the endless searching of many pockets which such a demand generally entails. Some of the lines are eight miles long, with twenty or thirty stations on them, but the fare for the whole distance is five cents, just as it is from one station to the next.

Each station is worked by two men, one who issues the ticket, and a second who watches the glass box to see that people drop their tickets therein, and opens the exit door when a train arrives.

The long cars composing the trains have doors only at the ends, and the admission of passengers is managed as follows: The space between every two cars is bridged by a platform and closed by small gates. To give flexibility in rounding curves, the gap between the gates is closed by collapsible iron lattices, working on the "handytong" principle. Four conductors travel with each train, and control the gates and entry of passengers, preventing ingress of late comers by summarily slamming the gate in their faces in the most approved Metropolitan Railway fashion. From the platform the passengers pass into the cars and seat themselves, if there is room; or stand up in the central gangway, and hold on to leather straps hung from the roof, if the seats are all occupied. At certain times in the day the cars are crowded to excess, people occupying every inch of standing room along the "aisle" as well as every seat.

On leaving a station the conductors, who always travel on the stage, put their heads in at the door at the ends of the car, and shout out the name or number of the next stopping place, so that passengers intending to alight there may make their way towards the doors and be ready to get out the instant the station is reached. One has to be quick in getting out, as the stoppages are short. When all have alighted, and people getting into the train are "all aboard," the conductor rings a bell, and when the engine-driver has received three rings, one from each conductor, he starts the train.

The cars are comfortable; the seats run along both sides, and are partitioned off to avoid crowding. The cushions on seat and back are covered with plaited rush covers, which keep very clean.

The trains run very quickly after one another, and there is no system of signalling, except at the curves. The driver of one train simply keeps his eye on the tail of the train in front of him. There have been very few accidents, although people were afraid to trust themselves on the roads at first.

A heavy baulk of timber is bolted down on each side of each rail, so that in case of an engine leaving the rails it would — perhaps — run along on the cross sleepers between these guides until stopped.

In some parts of the city, notably at 110th Street, the elevated roads run at a great height—fifty or sixty feet—above the street, owing to depressions in the ground level. The stations are here reached by elevators or lifts, and the iron supports of the railway are very fine pieces of work, strong and yet exceedingly light.

The "Elevateds" are a terrible nuisance and eyesore to the streets they pass over, making them noisy, dark, and dirty, for the little engines vomit forth showers of unburned coal, although they make no smoke. Passengers in the cars are requested by a printed notice "not to expectorate from the car windows"—a very necessary warning.

These railways pay exceedingly well, being filled all day long, and crowded in the mornings and evenings. They are all under one company—the "Manhattan Railway Company."

Beside the "Elevateds," New York is well served by trams or horse-cars, as they are called. These need no special remark, save that they are smaller than ours, have no seats on top owing to the "elevated road" girders, and that the fares are uniform, all being five cents.

The cars in New York have not the swivelling body which is so common in our north-country towns, but the car is run on to a turntable or the horses are moved round at the end of the journey.

The conductors and drivers only work about twelve hours a day, and out of that get from one to three hours for meals. Their pay is about 8*s.* per diem, and they look a smart set of men.

The companies usually pay large dividends, in spite of the competition of the elevated roads. The habit of riding to save time is so rooted in the American that all kinds of conveyances pay well. The Broadway Car Co. runs about 200 cars; each car makes about five round trips and takes about £6 a day.

The value of the property is shown by the fact that this Company have just agreed to pay the City Fathers $150,000 per annum for the exclusive right of running a cable road to replace the present horse track. It is high time this was done, for, there being no regulations as to overcrowding—it is a free country—the present cars are often most uncomfortably full, to say nothing of the excessive strain on the horses at starting.

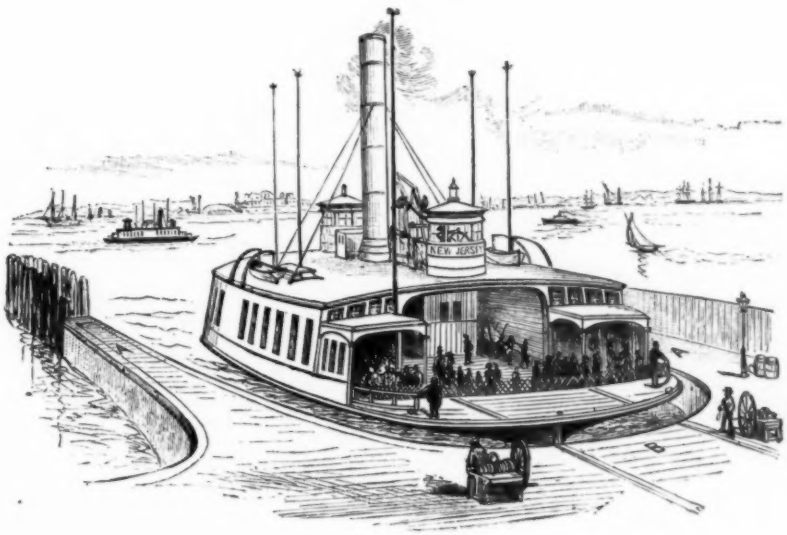
Cable cars are not at present much used in New York except on Tenth Avenue. In other towns, notably Chicago and Detroit, they are the rule, while in Boston electric cars predominate. The cable cars are worked on the same principle as the line down Highgate Hill, while the electric ones are run in several different ways—by a current passing through an overhead wire suspended from girders crossing the streets and pressed by a wheel on the top of the car; by currents transmitted through the rails, and otherwise.

The possession of a splendid line of quays half round the town—quays alongside which the largest ocean liners can lie and discharge their cargoes within a few yards of the merchants' warehouses—is what the New Yorkers have gained by building their city on an island.

In other respects the insular position is a disadvantage. Most of the termini of the great mainland railways are situated across the river, while communication with the immense sister city of Brooklyn and thriving Jersey City is hindered by the necessity of crossing the water.

The rivers must not be bridged—except by such stupendous and lofty structures as the Brooklyn Bridge—or the harbour would be ruined. The water is so deep that the approaches to any tunnel would have to be gradients of extravagant length, unless passengers were lowered and raised by elevators, and that process would take *some* time even in New York.[1]

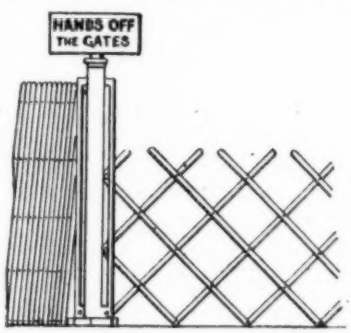
But the inhabitants are not to be beaten by such trifles as these; get to the other side they must, and "get there" quickly and frequently, too; and so by a magnificent system of ferries they have practically annihilated the north and east rivers.



The ferries are strange-looking craft, but most convenient and well managed. The paddle-wheels are practically invisible, as the superstructure comes out level with the boxes. The boats look like beetles crawling on the top of the water, the "walking beam" on top heightening the resemblance, as it looks like the creature's legs working.

The engines are single cylinder low pressure beam, with a ten or twelve foot stroke. One would think this type of engine unsuited to the frequent startings and stoppings, but the engineers, by constant practice and the aid of an indicator which shows them the position of the crank, always manage to stop with the latter off the "dead centre."

The ends of the boats are rounded and fit into a reverse-shaped dock, into which they are guided by floating wooden walls, A A. The stage B can be adjusted in height to suit the boat whether she be full or empty. When the boat is fairly into the berth two hooks are fastened to her and she is pulled tight up to the dock with windlasses; then the whole width of dock and boat becomes a gangway, and there is no bother with gang-planks or foot-bridges. The boats are double-ended, with two rudders, so no time is lost in turning round and "coming alongside"; they simply run to and fro in a straight line between their docks.



[1] Some tunnels, however, are now in progress.

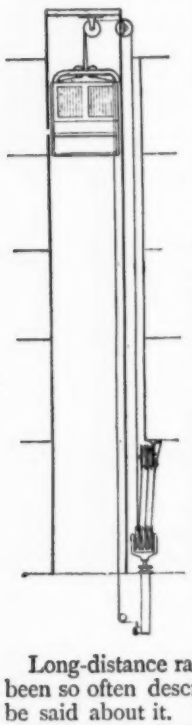
Carts and carriages are conveyed in the middle of the boat, and the passengers in two long saloons on either side—one of these being devoted to smoking. The state of the deck in these smoking compartments is such that a man is constantly at work sweeping them. America is free, and if the free-born consume cob-nuts or oranges they throw the shells or peel down promiscuously. The

practice of chewing renders a certain habit common, and here again the "free" pavement or deck is at the service of every citizen. The admirable politeness of Americans is at once an explanation of, and a contradiction to, facts like the above.

Some of the boats which run to the more distant suburbs, such as Staten Island, have two decks and an open-air promenade, and are lighted by electricity. All are heated in the winter time. Fares again are all the same, except in a few of the

long distance boats, and again there is only one class. Passengers are kept from leaving the boat, before she is properly moored and hauled up, by collapsible gates worked on the "handytong" principle, as between the cars on the "Elevateds." A notice is put up, "Hands off the gates," which is as well, for when the boats approach the stage, the passengers, in their anxiety to "get there," all press up close to this barrier, be the weather what it may. The deck man, having finished his hooking and hauling, claps these gates together with a bang, and then is the time when the unwary foreigner's fingers are apt to suffer, as every rail of the gate becomes a trap. Still it is a fine "dodge," for the gate folds up and occupies no room and the loss of a few fingers is a trifle compared to the complete "telescoping" process one risks under the falling drawbridge of a Liverpool ferry.

Some of the ferry boats are specially constructed for the conveyance of freight trains. A double line of rails is laid on the deck, the train run on to the boat from the quay, ferried across, and run off on to the rails at the other side. In many parts of America this system is carried out to still greater perfection, passenger trains being transported bodily on the same principle—the passengers retaining their seats during the voyage.



The Brooklyn Bridge does not fall within the scope of this article; it is not a "dodge," but a beautiful and graceful piece of engineering. It has been often described. The fourteen-inch cables are made up of a large number of steel wires, not twisted as in a rope, but each stretched across separately, so as to bear its due proportion of the strain. The span is about 1,700 feet, and the bridge looks a miracle of lightness. Passengers are carried over by cable cars, while there is a roadway for vehicles, and footpaths for pedestrians.

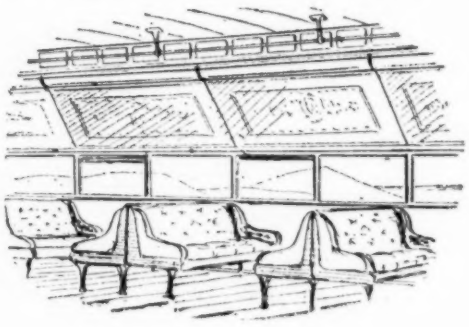
The ferries, the horse-cars, and the elevated roads constitute the principal modes of conveyance in New York. Carriage and cab traffic is small, owing to the badness of the streets. A cab-owner's repair bill must be very heavy, and the "one-horse shay" a great desideratum. The streets are paved with granite "setts," and each "sett" is two inches—sometimes an inch and a half—out of level with its neighbour. The result is picturesque, but trying.

The state of the streets is partly owing to the constant pulling about they undergo at the hands of

subway, telegraph, electric light, and steam heating companies, all of whom have their connections beneath the surface, and partly to the City Government, some of the members of which will not look after the contracts.

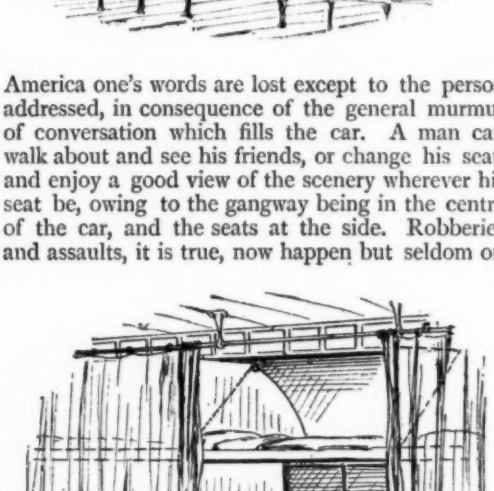
The value of land in New York has produced very high houses and offices. An office building of thirteen or fourteen floors is common, and this fact has led to a wonderful development in passenger elevators or lifts. The fastest go five hundred feet per minute, and in starting the descent one feels like the Tom Brown boy, tossed in a blanket, and "leaving all his inside sticking to the ceiling." The lifts are generally worked on a reverse block system: power being sacrificed for speed.

A hydraulic ram is connected to the many-sheaved pulley, and the speed of the ram is of course multiplied at the end of the steel wire-rope, to which the "cage" is attached, as many times as there are sheaves in the block. Power is obtained from the town main if the pressure be sufficient. If not, a small pumping-engine is put down.



The sketch shows an ordinary arrangement of passenger elevator. These lifts are inspected and tested periodically by the makers, and the owners are held responsible by law if any accident happens through breakdown or neglect. Most of the elevators are fitted with safety catch apparatus in case of breakage of ropes.

Long-distance railway travelling in America has been so often described, that little that is new can be said about it. The Pullman cars on our Midland Railway give but a faint idea of its comfort. The American cars are about seventy feet long, and nine or ten feet wide. They are most luxuriously fitted up, while on the "vestibule" trains the space between the cars is covered by a flexible leather passage way (as in our English Post-Office trains), so that one can walk right through the train without opening a door.



Every car, except the dining-car, is used for sleeping as well as for day travelling. The berths are very wide, about three feet, which is quite necessary, as, owing to the presence of ladies in the same car, one has to dress in the bunk behind the screenage of the heavy curtains.

All the windows are double, to lessen noise and exclude dust; the vehicles are most beautifully "sprung," and travel as easily as our coaches, in spite of the asserted inferiority of American "tracks." In fact, there are many worse berths for a tired man than one in an American "sleeper," and few better.

The day travelling also is surely more pleasant than ours. There is a prejudice here against the long car system, on account of its supposed want of privacy. As a matter of fact, however, is it possible for two friends to converse with any comfort in an English "compartment" without most of the other occupants hearing every word they say? In

America one's words are lost except to the person addressed, in consequence of the general murmur of conversation which fills the car. A man can walk about and see his friends, or change his seat, and enjoy a good view of the scenery wherever his seat be, owing to the gangway being in the centre of the car, and the seats at the side. Robberies and assaults, it is true, now happen but seldom on

English roads, but such as do occur are the direct fruit of our "private" system.

The season-ticket business is rather differently worked from ours. The ticket is a card for so many journeys, each journey being represented thereon by a star or spot. The conductor walks through the car during the journey and punches a spot out of each traveller's ticket. Hence the idyll—

> "Punch, brother, punch with care,
> Punch in the presence of the passengare."

All the bother of "showing your season," which rare event generally occurs when the precious document has been left at home in some other coat, is avoided, while the company dispenses altogether with the services of ticket collectors pure and simple.

W. E. BUCK.

# Varieties.

**Educated Apes.**—In an article in the "Leisure Hour" on Delagoa Bay railway, the writer gave personal testimony to the fact of a chimpanzee being taught to do useful work on the line. The "Revue Scientifique" has been discussing the question whether the apes of Africa can be taught to do things which they have hitherto been supposed incapable of learning. Emin Pacha told Mr. Stanley that he had seen apes carrying lighted brands as torches during night journeys. From Purchas' book of travels, a quotation is given from André Battel, who in 1625 says he saw a number of apes sitting round a fire, but it does not appear that they lighted it, but only took advantage of a camp-fire that had been left by travellers. In the Zoological Gardens, the chimpanzees and other anthropoid apes have been certainly found capable of acquiring various knowledge, as indeed may be observed in humbler specimens of monkeys, in companionship of Italian organ-grinders. Some of these show almost as much intelligence as well-trained dogs.

**The Queen of Roumania's Confirmation Hymn.**—Many of the readers of our recent paper on "The Royal Couple of Roumania" will be glad to be informed that "The Life of Carmen Sylva," as translated from the German by Baroness Deichmann, has been recently issued (Kegan Paul, Trench, Trübner & Co.). It abounds in interesting and stimulating facts, and is enriched by occasional translations from her poems, some of which are from the pen of Sir Edwin Arnold. One such we give. It is part of a poem written in 1860, shortly before her confirmation. "I am sure," she had written to her brother a few months before, "you can understand what I feel in having entered into the year in which I have to bind myself with a promise before the altar to become a responsible member of human society. I think of it with real apprehension, for I am not yet ripe for it." Her poetic journal of that time, we are told, revealed a soul longing for God. Sir Edwin Arnold thus translates:—

"Praise ye the Lord who in mightiness hath wrought ye,
Praise Him who safely with blessings hath brought ye,
Praise Him, thou earth! and thou star of the sky!
Let what hath being the Lord glorify!

I will give thanks to Him, Father of Life,
I in His way will walk, faithful in strife;
I for His light will seek, guiding us all,
Him I will love, for without Him I fall."

**Doing one's very best.**—In a speech of Mr. Gladstone upon the dignity and duties of labour, he spoke of the efforts to be made in every department of work to attain to the highest excellence attainable. There is a story told, he said, of Dr. Johnson which is a little applicable to the case. We all know more or less about Dr. Johnson; it is a name very dear to the hearts of the people of this country, and very justly so. He was a grand specimen of the English character. He had a most extraordinary faculty of conversation; perhaps he was the greatest conversationalist that ever lived. Somebody said to him once, "Dr. Johnson, how did you acquire this extraordinary faculty of excellence in conversation that you have?" Dr. Johnson replied, "I am not aware of any method by which I acquired any excellence of that kind, if I possess it, except this, that when I have had anything to say I have always tried to say it in the very best manner that I could." There is the true principle of technical education—there is the principle that will live and will glorify labour; there is the principle that will raise the working men of this country in the best sense and in the best manner—namely, by means of a power, of an energy springing up within themselves, and devoted by themselves to the improvement of their condition by the improvement of their work. Mr. Gladstone added some strong words about the tendency of "the British workman" in modern times to scamp his work. On being afterwards called to task for this remark, Mr. Gladstone said that he made no special reference to manual labour, but to every kind of work, even political and educational work, all things tending to hinder "thoroughness" in an age of so much hurry and commotion.

**Cardinal and Prince.**—In the discussions arising out of the precedence given in an unofficial list of members of a public commission to Cardinal Manning next to a prince of royal blood, the question was complicated by the respect due to age and personal character. But when a similar claim of precedency was asserted as a matter of right by Cardinal Taschereau at a public dinner given in Canada to H.R.H. Prince George of Wales, he was very decidedly and properly told that his precedence could not be admitted, and the Prince-Cardinal absented himself from the loyal demonstration. We are glad that this firmness was shown by Englishmen in Canada, although it is important there to conciliate the Roman Catholic population. Titular dignitaries of foreign appointment require to be reminded of their proper place in this English realm. Cardinal Taschereau, being placed below Admiral Watson and General Ross, but before the Protestant Bishop of Quebec, quoted the case of Cardinal Manning. Lord Stanley, the Governor, and Prince George were disposed to yield, but the Admiral and the General said they held the Queen's Commission, and would not give place to the nominee of a foreign Power.

**Flower Emblem of United States.**—The floral emblem of the United States of America has again been under discussion in the press, and no consensus of opinion can be obtained. Some say "the golden rod"; but there are several plants so named, and no species is in wide and general cultivation in North and South. The architect of the American Clock Tower and Fountain at Stratford-upon-Avon, the gift of Mr. G. W. Childs of Philadelphia, wishing to introduce floral emblems in the ornamental work of the international memorial, could not find any flower recognised as representing the States; and after much consideration the leaves of maize or Indian corn seemed to be the most obvious and characteristic feature of American as contrasted with English vegetation. The Indian corn is familiar throughout the States, east and west, north and south, and a more graceful as well as useful product of the soil could not be taken as the national floral emblem. It appears as such in the Stratford memorial to Shakespeare.

**Marianne North.**—A series of papers on famous "Lady Travellers" lately appeared in a popular periodical, and among these was not found the most remarkable and interesting person of the time in this department, Marianne North. Botanist and artist, it was by her magnificent collections of plants, and her equally magnificent paintings, that she was known to the few, while other travellers of less daring and adventure have become known more widely by their books. Three times Miss North travelled round the world. In 1871 she first visited the United States, Canada, and the West Indies. In her next wanderings she visited South America, and more particularly Brazil, from which in 1877 she returned with marvellous specimens and drawings of rare or new plants. Japan, the Himalayas, California, Java—all regions of the globe she seems to have traversed, and for the last ten years the display of her sketches has been one of the most attractive features for visitors to Kew Gardens. The gallery bearing her name was built at her own cost, and generously given for national use. A portrait, with memoir by her friend Amelia B. Edwards, appeared in the "Queen" of Sept. 13, 1890.

**Lord Carnarvon.**—The first public appearance of the late Earl of Carnavon was as mover of the Address in the House of Lords at the opening of the session 1854. The Earl of Derby made very flattering reference to this speech, saying that it was "characterised by a facility, grace, and modesty, promising to make the speaker an ornament of the House."

Lord Carnarvon, throughout his career, more than justified the high expectations formed of his ability and his character. He held with distinction various important offices, including the Secretaryship for the Colonies, and the Lord Lieutenancy of Ireland. Three times in his public life, his independent spirit and keen sense of honour led him to resign office in the administration through conscientiously differing from his colleagues. He was always far more a patriotic than a party man, and from his moderation and honesty he was spoken of as the Lord Falkland of his time. He was a very laborious man, considering the infirm health that he had to contend with, and few men so conspicuous in public life have possessed more sound knowledge and literary culture. His loss will long be deeply regretted by all who knew his talents and his worth. We are glad to notice that the first public function undertaken by the young earl was inaugurating a parish room on the estate, when in graceful words he referred to the old friendship of the Vicar, Canon Portal, with his father since their college days.

**Master Cutler of Sheffield.**—The last Master installed was the 267th chief of this ancient Guild. A very important personage he is; and that beyond his own town and jurisdiction. There is a story that at a dinner given by the Lord Mayor of London to all the mayors and chief magistrates of England the Master Cutler was placed by an ignorant usher in an ordinary place at one of the long tables. A superior official saw the blunder in time, and sent the usher to rectify it by conducting the Master Cutler to high place at the table of honour. The messenger humbly apologised for the mistake, adding to the apology this candid aside: "I thought you was only one of them country mayors," inserting an epithet more emphatic than polite.

**Guernsey State Independence.**—The "Home Rule" independence of the Channel Islands had an amusing illustration lately. H.M.S. "Fire Queen" arrived at Guernsey with Admiral Sir John E. Commerell, K.C.B., V.C., Flag officer at Portsmouth, making the annual inspection of the Channel Island stations. The "Fire Queen" took up a convenient berth at the side of the chief pier of St. Peter's port harbour. The place being wanted for one of the mail steamers, the harbour-master politely requested the officer in charge of the "Fire Queen" to remove to another mooring. The officer as politely refused to budge, saying that the "Fire Queen" was a Government ship and was in a Government harbour. The local official begged to inform him that the "Fire Queen" had no special privilege, as the harbour belonged to the State of Guernsey, and not to England. "Where did you get the money to make the harbour?" was the rejoinder. "We borrowed it, and pay it back by harbour dues," was the unanswerable statement, and the Admiral's yacht had to move.

**St. Patrick's Cathedral, New York.**—The Roman Catholic cathedral in New York, a city which, from the number of its Irish inhabitants, might more fitly be called New Cork, is to have fifteen bells, weighing in all 30,000 lbs. The bells are the gifts of various persons and communities, and will each be inscribed with name of the donor. The church itself is indebted for no inconsiderable proportion of its building-fund to the donations of Protestants and Europeans. Every Irish hotel servant has a collecting-book, and for many years there has been a well-organised system of begging donations from all frequenters of hotels, the request for a small sum being rarely refused; and the writer confesses to have himself contributed, admiring the zeal and overcome by the importunity of these humble assistants of their Church. The same worldly wisdom has been shown in regard to all the public edifices of the Roman Catholic Church in the United States.

**Forth Bridge.**—According to the statement presented to the Forth Bridge Railway Company, the total cost of the structure has been £3,322,640.

**Electric Traction.**—There has been a successful commencement of working tramcars by electricity in North London. The application of electricity to traction has for some time received far more important development in the United States. At the commencement of this year there were in operation in different States 200 electrical tramroads, having a collective length of 1,641 miles, with 2,346 motor-cars travelling thereon. Further extensions are being rapidly made; thus, one company alone has 39 additional roads, of a collective length of 385 miles, under construction, to be worked through the agency of storage-batteries. The idea cherished by Siemens, of utilising the power of Niagara, appears about to be realised at no remote time. In like manner the tides of our English coasts could be used for obtaining power, to be conveyed by conductors.

**Sedan Day.**—The anniversary of the Battle of Sedan has become more than ever a national holiday throughout all Germany, as well as in Berlin. The Bourse and all public offices are closed; processions with music and banners, sports, and every kind of entertainment, with fireworks and torchlight marches at night, mark the celebration of the conclusion of the war by the decisive day of Sedan. There is nothing of the spirit of Chauvinism or military boasting in this holiday, but a thankful recognition of wanton invasion being repelled, and peace secured by the defeat of the restless aggression of France.

**Patent Medicines.**—Since 1860 the Government stamps on patent medicines have increased from £43,000 to £220,000 per annum. It is estimated that the "British public" pays at least a million and a half sterling for these nostrums, some of which are harmless enough, yet help to swell the return. Some persons wish to abolish the stamp. On the contrary, it would be advisable to increase the amount, and to extend the use of a Government stamp to many other articles which the rich and the unwise are willing to pay for. A larger revenue could be easily gained with no hardship to any person. The patentees of quack medicines and articles are almost invariably very wealthy.

**Telephonic Progress.**—The operations of the National Telephone Company will illustrate our progress in telephonic intercommunication. That company has now 22,743 exchange lines, besides nearly 5,000 private lines; its exchanges number 272 and its call offices 526. The number of instruments under rental in England has now reached 99,000. But, important as this figure is compared to our use of the telephone a very few years ago, it sinks into insignificance by the side of the number of instruments under rental in America, which at the beginning of the present year had reached 222,430, being an increase of 16,675 over the number in 1889. Only thirteen years have elapsed since the telephone was first exhibited as a practically workable apparatus to members of the British Association at the Plymouth Meeting, and the number of instruments now at work throughout the world may be estimated as considerably exceeding a million.

**Chinese in Australia.**—In 1881 there were in all the Australian colonies less than 44,000 Chinese. Notwithstanding the strong efforts to repress immigration, the number has increased on the whole by nearly four thousand, the number now being 47,435, an increase of 3,727. In Victoria the decrease has been from 12,128 to 11,290; in Queensland from 11,229 to 7,691 (due probably to Kanaka or Polynesian labour); in New Zealand from 5,004 to 4,515. On the other hand, the number of Chinese has increased in New South Wales from 10,025 to 10,521; in South Australia from 4,151 to 6,650; in Western Australia from 145 to 625; and in Tasmania from 844 to 1,000. The numbers may be useful for reference in statistics of future Australian population.

**A Wonderful Old Woman.**—In Plot's "Staffordshire" there is record of an old woman, Mary Cooper, who saw five generations of her descendants. She lived at King's Bromley, near Rugeley. The saying about her was, "Rise, daughter, go to thy daughter, for thy daughter's daughter has got a daughter."

**A Fiji Jubilee.**—In recent years there have been numerous jubilee and centenary celebrations, but not one has been more remarkable than is recorded in the history of the Fiji Islands. Christianity was first introduced into Fiji in 1835, and in 1885 the jubilee was celebrated. An aged missionary, James Calvert, went out from England expressly to take part in the rejoicings and thanksgivings. In a little book "From Dark to Dawn in Fiji" (Partridge & Co.), by R. Vernon, the event is described:—Mr. Calvert had now reached the age of seventy-two, but he was still hale, showing no sign of decay from the many changes, sufferings, and toils to which his long missionary career had subjected him. His love for Fiji had not diminished with advancing years; his warmest affections were there, and he became possessed with an ardent longing to see his beloved people again, and take part with them in rejoicing over the triumphs of the Gospel during these fifty years. Accordingly, the veteran toiler set out on a voyage round the world, and spent forty happy days in Fiji, where he took a prominent part in many services, being glad to witness the progress made in every branch of mission work, and the general prosperity and stability of the people in spiritual matters. Referring to this visit, Mr. Calvert remarks—The latest statistics to hand show extraordinary results of Christian work; and it is remarkable that where there was not a single Christian in Fiji in 1835, when the mission commenced, in 1885, when the jubilee was celebrated, there was not an avowed heathen left in all the large group of eighty inhabited islands. The returns show that in 1885 there were 1,322 churches and other preaching places, 10 white missionaries, 65 native ministers, 41 catechists, 1,016 head teachers and preachers, 1889 local preachers, 28,147 Church members and 104,585 attendants on public worship, out of a population of 110,000.

To-day cannibalism, widow-strangling, and infanticide are unheard-of cruelties. And the vitality of the work is proved by the fact that the oversight of all the Church in Fiji is undertaken by the Australian Wesleyan Conference, which supplies heartily devoted white missionaries, who work side by side with ordained native ministers and preachers. The Fijian Church is likewise continually sending native missionaries to other distant islands, to preach Christ in other tongues.

**Australian Memorial in St. Paul's.**—One of the most graceful acts of Lord Rosebery during last season was the unveiling of a memorial tablet to Mr. Daley, an Australian statesman. His Lordship made an address, in which he called attention to the fact that the tablet was the first memorial erected in the Cathedral to a colonist, and said it was, therefore, a milestone in the path of those having faith in the federation of the Empire.

**Tonquin to the Chinese Frontier.**—A new trade route has been established to Yunnan, through French territory. A steamer, called the "Yunnan," has been specially built for navigating the Red River or Songka, and reaches Taokang, which is close to the Chinese frontier, not far from Mongtze, an ancient and important trade centre. By this route, it is stated that French goods will reach Yunnan from the port of Haiphong in Tonquin in twenty-six days, instead of forty by the old route.

**Christ's Hospital.**—The new governing body of Christ's Hospital, London, approved by the Queen in Council, by an order dated August 15, comes into operation on January 1, 1891. To this new Court is referred the scheme for removal of the "Blue Coat School" to some rural or suburban site. The change of St. Paul's school from the City to Hammersmith has been a successful move, and no doubt the removal of Christ's Hospital to another site would be an advantage. The old associations will live in history, and in the biographies of distinguished "Blues." What will be done with the old site in Newgate Street remains to be seen. The value of the ground must be enormous, but we hope it may fall into the hands of none who will not preserve the grand hall, one of the finest architectural structures in London. This imposing appearance it owes largely to the edifice rising from a lofty basement, and not (as in most London buildings) squatted on the low level of the soil. Whitehall Chapel is in similar way elevated, and thus both these edifices have a grandeur beyond what their mere architecture presents.

**Personal Influence.**—It is one of the healthiest features of our day, that all thinking people are growing sensitive about their influence. To many the chief dread of sin arises from perceiving that they cannot sin themselves without directly or indirectly involving others; and it would be to them the greatest of satisfactions to be able to believe that they are doing good to those with whom they are brought into contact, and not harm. This is a feeling worthy of the solemn nature of our earthly existence, and it ought certainly to be one of the guiding principles of life. Yet it is not without its dangers. If allowed too prominent a place among our motives, it would crush the mind with an intolerable weight, and cause conduct to appear so responsible that the spring of energy would be broken. It might easily betray us into living so much for effect as to fall into hypocrisy. The healthiest influence is unsought and unconscious. A man may strive for influence and miss it. But let him grow within himself—in self-control, in conscientiousness, in purity and submission—and then he will not miss it. Every step of inward progress makes us worth more to the world and to every cause with which we may be identified. The road to influence is simply the highway of duty and loyalty. Let a man press nearer to Christ, and open his nature more widely to admit the energy of Christ, and whether he knows it or not—it is better perhaps if he does not know it—he will certainly be growing in power for God with men, and for men with God. "Abide in Me, and I in you: as the branch cannot bear fruit of itself except it abide in the vine, no more can ye except ye abide in Me." *Stalker's "Imago Christi."*

**Paris as a Seaport.**—The probable success of the Manchester Ship Canal has revived the serious consideration of making Paris a seaport. M. Ives Guyot, Minister of Public Works, has been authorised by the Council of State to make full examination of the scheme proposed by the French engineer, M. Bouquet de la Grye. The shipowners and merchants of Havre will watch this inquiry as anxiously as those of Liverpool did the early discussions on the Manchester Canal.

**Welsh Bible Recovered from the Bottom of the Sea.**—A Welsh paper, the "Genedl," contained lately a singular letter written from the Rev. J. Mostyn Jones, of Oak Hill, Jackson County, Ohio, U.S. Mr. Jones says he has an old Bible, belonging to a seaman named Enoch Shields, given to him by some friend in Llantrisant. The ship foundered in the Pacific Ocean, and none of the crew were ever heard of. Many years afterwards some divers brought up a safe from the captain's cabin of the lost ship, and in it was a Welsh Bible. The divers gave it to the first Welshman they met with, a blacksmith in San Francisco. After passing through several hands, it was brought by a Mr. Roberts to Mr. Jones, when in California, and he now writes in hope of the relic being claimed by some relative of Enoch Shields. Failing this, it will be placed in some public library.

**Protection of Animals from Cruelty.**—In "Notes and Queries" for August 30, 1890, it is stated on the authority of Mr. Moncure Conway that there was no society for protection of animals from cruelty, either in Europe or America, till Mr. Darwin published his "Origin of Species." Mr. Conway's statement was made in a Chicago paper. There was a society in Edinburgh long before the appearance of Darwin s book, and we believe that in London and in New York also were similar institutions. What connection Darwin's theories have with humanity to animals is not apparent.

**Revaluation of Property.**—In London the increase of value, as appears from the report of the Commissioners of Inland Revenue, has been large and steadily progressing. Throughout the country there is in some respects advance, but in others diminution. In 1879-80, the annual value of lands assessed under Schedule A. for income was £69,548,000; now it is only, or little over, £58,000,000, a decrease of £11,548,000 in the decade. House property has everywhere increased in value. The increase is also great for "trades and professions," and in the claims of property assessed under Schedule D. the increase in ten years is about £40,000,000.

**M. Edouart's Silhouettes.**—In ten years M. Edouart cut more than 50,000 silhouette portraits, about 10,000 of them being children. He made duplicates of all for reference, with little memoranda. His reference portraits occupied fifty large books. He travelled for many years afterwards, and probably produced, in all, above 100,000 portraits. In 1849, on returning from America, the "Oneida," in which he was a passenger, was wrecked in Vazon Bay, off the island of Guernsey, and the vast collection went to the bottom of the sea. Mr. Andrew Tuer gives this information in "Notes and Queries." He had a narrow escape, and was hospitably welcomed in the house of the Lukis family in that island. To Mrs. Lukis he presented about a dozen volumes which were recovered from the wreck. He died at Guinnes, near Calais, in his seventy-third year, in 1861. Many of his portraits have been engraved in books of biography.

**Memorial to Robert Browning in Wales.**—A tablet in memory of Robert Browning has been placed in a church near Llangollen. In the autumn of 1886, Mr. Browning spent upwards of two months at Llangollen, and during his stay there the old man walked every Sunday, in fair weather or foul, to the little church of Llantysilio, one of the oldest in Wales. The poet and his sister occupied the pew of Sir Theodore Martin, whose place, Bryntysilio, which the Queen visited last year, is not far off. A tablet has been placed by Lady Martin on the wall close to the spot where he was accustomed to sit, bearing the following inscription: "In memory of Robert Browning, poet (born 1812, died 1889), who worshipped in this church ten weeks in Autumn 1886, by his friend Helen Faucit Martin." This graceful tribute to the veteran poet's memory reminds us of the tablet near the place where Dr. Johnson used to worship in St. Clement Danes in the Strand.

**Forth Bridge Traffic in October.**—There were at the beginning of October, about six months after the opening of the bridge, at least 140 trains crossing daily. There is no limit as to speed in the passenger trains, but those with freight are limited to 25 miles per hour. As there is only a space of about 30 inches between the tracks and the pathways on the bridge, a limitation of speed seems a proper precaution.

**Gordon Hall, Tientsin.**—A Municipal Hall was opened last summer at Tientsin, by the Viceroy Li Hung Chang. The Hall is called after General Charles Gordon. The Viceroy, in his speech on the occasion, made warm and eloquent reference to the services and the character of the great Englishman to whom China owed its safety during the Taeping rebellion. Li Hung Chang very soon forgot Gordon's misunderstanding with him, and always retained a high estimate of his friendship. No one more sincerely mourned his death at Khartoum than the Chinese Viceroy, who sent a handsome donation for the Gordon memorial.

**Carbonised Peat.**—A patent, of Canadian origin, has been with considerable success worked in preparing peat for fuel resembling coal. The prepared fuel is as dense as coal, ignites as readily, and burns steadily with clear flame. This carbonised peat has the advantage of being almost or wholly free from sulphur. For smelting purposes and for furnace fires it is eminently suitable. The ash remaining after combustion is far less than that of any coal. As there are nearly three million acres of bog-land in Ireland, there ought to be a great industrial resource here. What is wanting is enterprise, as well as security for capital. For peat-moss litter there is also a great demand, but it all comes from Holland and France instead of from Ireland, where any quantity could be cheaply made.

**Conditions of Labour.**—Although the French abstained from showing much interest in the Berlin Conferences on similar questions, the Government of M. Carnot has appointed an inquiry by the Minister of Commerce into the conditions of labour in France. Schedules of questions will be widely distributed among all employers of labour, and various methods are to be taken to obtain accurate information about wages, times of work, dress, food, disease, provident clubs, and every department of statistics bearing specially on the working classes. M. Jules Roche will propose that this inquiry should be carried out at the national cost, whatever may be the result as bearing on legislation.

**Clarence Peak, Fernando Po.**—M. Rogozinski, whose name is already connected with exploration in the Cameroons, in a communication to the Paris Geographical Society, has described his ascent of the Clarence Peak, in Fernando Po, which has only twice before been ascended by Europeans—in 1843 by Beecroft, and in 1860 by Pellon and Man. The slopes of the mountain are described as extremely steep and rugged, where the hands have to work as well as the feet, and where it is sometimes impossible to find a level spot to pitch a tent. The lower slopes are covered with forests of tree ferns and rubber trees, while streams dash down by violent and savage cascades to the low-lying lands along the shore. The forests are gradually succeeded by slopes which are quite treeless save for a few acres of arbutus. In the higher regions, where even the grass ceased, the bearers began to desert one by one, unable to bear the solitude and desolation, and fearing to face the spirits of the mountain in company with the white man. It was also found that the guide had lost his way, and much time was lost finding it again. However, at 2 p.m. on January 15, the travellers stood on the summit of the Clarence Peak, after more than a week's climbing. Remnants of the post erected by Pellon in 1860 were found. Although a crater is distinguishable, all other traces of volcanic action have disappeared in the course of centuries. During the descent a collection of mosses and parasitic plants was made for the University of Lemberg, and a number of orchids were also collected.

**Round the World in fifty-three Days.**—A post-card despatched from the London Guildhall post office, on May 17, in honour of the Penny Postage Jubilee, went viâ United States to Japan, and thence viâ Brindisi back to London, the journey taking sixty-eight days, arriving July 24. This record has since been beaten. A card sent in the reverse direction to Singapore (viâ Brindisi), thence to Hong Kong and San Francisco, across America, reached London in fifty-three days. The cost was 3½*d.* The card bore request to postmasters to forward without delay.

**Fawkes of Farnley Hall.**—Among the notable art-sales of last season was a selection of the Turner water-colour drawings, which have long been precious treasures at Farnley Hall, Yorkshire. Some of Turner's most celebrated works were sold at Christie's on this occasion. Among them was the "'Victory' returning from Trafalgar," which was bought by Mr. Agnew for £2,152 10*s*. Another was a small replica of the picture which hangs between the two Claudes in the National Gallery. Turner sold this picture to Lord de Tabley, and afterwards bought it back when brought to auction in order to bequeath it to the nation. The Farnley Hall small copy sold for a thousand guineas. The "Windermere" picture sold for £1,260. The "Lake of Geneva from above Vevey," put up at £1,000, fetched £2,625. A large number of Rhine landscapes were in the collection. The total brought by the day's sale was £24,361. It is now generally known that the notorious Guy Fawkes was a scion of the family of Fawkes of Farnley.

**Biological Laboratories.**—At the Congress of the British Medical Association, held at Birmingham in 1890, Mr. Lawson Tait, F.R.C.S., President of the Mason College, had the courage to utter a strong protest against what he called "that senseless system of biological training which had set in as a fashion at Cambridge, Oxford, and Edinburgh." Mr. Lawson Tait's eminence as a surgeon, and as a man of philosophical spirit, entitles his opinion to consideration on this matter. The voice of all the greatest surgeons and best teachers of physiology, until recent years, was opposed to the performance of experiments and demonstrations on living animals in points sufficiently elucidated by clinical observation and pathological researches.

**Bradshaw's First Guide Books.**—The early editions of "Bradshaw" are sought for as rare and curious records. The first number issued was on October 19, 1839, relating to the northern part of England; the second, on the southern districts, on October 25 of the same year.

# Household Queries.

To Correspondents.—At the commencement of a new volume we again find it necessary to explain what is the scope of these Notes and Queries and what is not admissible. They are intended to embrace topics of some general Family or Domestic interest. We must decline to reply to questions of personal medical advice, or of mere curiosity, or concerning charitable institutions, or the disposal of work, or generally to queries of any merely *personal* character whatever. However urgent some of these may be to the senders, they cannot be given consideration here in space belonging to the general reader; nor are we able to undertake solutions of all sorts of such individual difficulties. Such queries are therefore necessarily unnoticed. Correspondents would also do well to observe that we are obliged to go to press about the 1st of each month for the issue of a month later, and the "early replies" so often asked for are therefore impossible.

---

**Poultry.**—Deaths.—*Kindly advise me what to do with my fowls. One morning last week I found a young hen dead in the roost, which appeared as if it had fallen off the perch. On arriving home a few days afterwards, I found another hen dead in the nest-box, which appeared in good health the day before. The perches are about one inch round?*—The perches are too small, but this had nothing to do with the deaths, and your other arrangements are right enough. The deaths are most likely due to apoplexy, and this probably to overfeeding. There might be congenital heart-disease, but the other is more probable.

Next Year.—*Do you think I ought to invest in any more fowls this year? I have just bought four pullets, and have now eight hens and a cock, all Leghorns. Dorkings, I believe, are rather apt to have an illness called "bumble-foot." Are Hamburghs good all round? I find Leghorns excellent layers, but bad sitters. One of the hens has taken it into her head to sit now. I suppose it is much too late to let her? The new pullets were hatched on April* 18, *when will they begin to lay? I have no grass run, but they seem to do pretty well?*—You had better stop at what you have. Hamburghs are not suitable except on grass. Leghorns are non-sitters, and yours could not be depended on, and it is much too late. Your April pullets ought to lay by the end of October, if not earlier.

**Berries.**—*Would you be so kind as to inform me how to preserve berries (rowans, for instance) through the winter for decorative purposes?*—We do not know any way in which this can be done. If it could, there would be no market for artificial ones, which are very cheap now.

**Deposit in Kettle.**—*We use a large iron kettle for boiling water, but in a short time, owing to the hardness of the water, the inside of the kettle becomes incrusted with a thick coat, which makes the water twice as long in boiling. Can you inform me of any simple mode of removing this crust?*—Hard waters differ so much that we cannot be sure, but if you dissolve half an ounce of sal-ammoniac in the kettleful of water, and simmer gently for half an hour after it boils, the crust will probably be so softened as to be removed with little difficulty.

**Worms in Furniture.**—A correspondent writes strongly confirming our own advice against the use of paraffin oil as destroying the polish as well as the worms. He says he has since tried a preparation supplied by *W. Johns, of Northgate Street, Ipswich*, which answered the purpose admirably, and promotes the polish of the wood with slight rubbing. He thinks that no worm or even moth can exist where this preparation is used. Several preparations have now been warranted by the experience of various readers for this emergency, and the subject has, we think, been sufficiently treated, for which thanks are due to those who have assisted.

**Linoleum.**—*Kindly inform me what is the best way to clean linoleum. I have covered the hall and kitchen floor with this material, and am doubtful as to the way it should be treated?*—It should be washed with soap and water, without soda, and wiped dry with a cloth. If it is the "indurated" kind, in which the pattern goes right through, there is a "reviver" sold, which, after such washing, may be applied occasionally, but it is little use for the ordinary kinds.

**Stains in Marble.**—*Kindly tell me what will clean and take stains out of white marble?*—We can add nothing on this subject to the directions which were given in part 455 for November 1889.

**Silk Belts.**—*I would be glad to know how to clean white silk Petersham belts. Is there any way of doing them at home?*—You can get a very fair result by washing with soap and water, and ironing out *whilst wet* with a *hot* iron.

**Hard Water.**—*I should like to know some easy way to soften hard water, and also to know what constitutes the difference between hard and soft water?*—Hardness depends on the presence of lime or magnesia in some form, but the form and treatment differ. Lime carbonate (chalk) dissolves very little indeed, unless there is carbonic acid also in the water. If so, half an hour's boiling drives most of the gas off, throws down the chalk, and makes the water much softer, at the expense of fur in the kettle. For making tea, a pinch of carbonate of soda is an old and effectual remedy for most hard waters; and there are also preparations sold, such as "anti-calcaire," which are more or less useful. They mostly depend on Dr. Clarke's process, which consists in *adding* lime to water with chalk in solution. The free lime combines with the carbonic acid which has held the chalk in solution, forming more carbonate, when the whole is thrown down. But such expedients are useless when sulphate of lime is the cause, and you must therefore be guided by your own local analysis.

**Glazing Linen.**—*Kindly let me know how to put a glaze on starched linen without using a "glazing iron," if possible?*—You cannot put a really good glaze on without. The nearest you can get to it will be by the use of a little borax and spermaceti in the starch as described in a previous number, and to use your iron freely with very heavy pressure.

**Small Skins.**—*Would you kindly say how to preserve water-rat skins; and would any other rat's skin be preserved in the same way?*—Tack out on a board, fleshy side upwards, and carefully remove all superfluous matter down to the skin. Then rub in well arsenic soap, obtainable at any bird-stuffer's. Be careful not to leave it about, or let it get into any scratches; or use india-rubber gloves or finger-stalls.

**Knitting.**—SHAWL.—*Kindly give me a knitted pattern for shawl in Shetland wool; a lacelike superior pattern would be valued?*—The following is an old and favourite pattern, but has been recently republished in "Weldon." *For centre of shawl.*—Cast on stitches sufficient for the width of shawl, any number divisible by six, with one additional stitch to keep the pattern straight, and four extra for edge stitches. 155 stitches with Shetland wool will make a nice shoulder shawl, measuring with border about a yard square, and will require about 5 ozs. of wool. More would be required of Andalusian, as, being thicker, it weighs heavier. Commence by knitting 4 plain rows. *1st pattern row:* Knit 5*, make 1, slip 1, knit 1, pass the slipped stitch over, knit 4, repeat from * to the end of row. *2nd row:* Knit 2, purl all along, and knit the last two stitches. *3rd row:* Knit 3*, knit 2 together, make 1, knit 1, make 1, slip 1, knit 1, pass the slipped stitch over, knit 1; repeat from *, and there will be 3 stitches to knit at the end of the row. *4th row:* Same as the second row. *5th row:* Knit 2, knit 2 together,* make 1, knit 3, make 1, slip 1, knit 2 together, pass the slipped stitch over, repeat from *, and when you get 4 stitches from the end of the row, make 1, knit 2 together, knit 2. *6th row:* Same as the second row. Repeat from the first row till the shawl is the size you desire it to be. Knit 4 plain rows. Cast off. This pattern is very light and pretty worked with Shetland wool, and a pair of No. 10 bone knitting needles. If a warmer shawl is desired, Andalusian wool may be used and No. 9 needles. *For the border.*—Cast on 19 stitches. *1st row:* Slip 1, knit 2, make 1, knit 2 together, knit 1, make 2, and knit 2 together six times, knit 1. *2nd row:* Knit 3, purl 1 and knit 2 five times, purl 1, knit 3, make 1, knit 2 together, knit 1. *3rd row:* Slip 1, knit 2, make 1, knit 2 together, knit 20. *4th row:* Cast off 6, knit 15, make 1, knit 2 together, knit 1. Repeat for the length required to go round the shawl, and sew on, allowing nice fulness at the corners. The border should be knitted with the same wool as used for the shawl, but needles one size finer.

COCKATOO WOOL.—*Kindly say where the "cockatoo" wool may be obtained which was mentioned in the August part. I have tried every fancy-wool shop near without result?*—It is new, and will probably be more known soon, but you could get it of the manufacturers if necessary, who are the Wharfedale Fancy Knitting Wool Co., Burley-in-Wharfedale, near Leeds.

**Preserved Tomatoes.**—*Oblige by giving a good reliable way of preserving tomatoes for winter use, I having tried bottling them as gooseberries are done, and boiling them down with pepper and salt, in both cases the tomatoes have gone mouldy?*—Here is one way: Cut the tomatoes into pieces, and simmer them gently over a slow fire till they are reduced to a pulp. Squeeze the juice from this pulp, boil it until it is as thick as cream, and then pour it into small bottles. Place these in a large boiler with cold water up to their necks. Bring the water to the boil, and let it boil for a quarter of an hour, then lift the bottles from the fire and let them remain in the water till it is cold. Cork securely and wax the corks. Store in a cool dry place. The tomatoes boiled whole might probably succeed if you were particular enough to exclude every particle of air, pressing the cork into an over-full bottle while boiling hot, so that water was forced out, and then waxing over cork and neck with sealing-wax dissolved in spirit; especially if you added a very little salicylic acid.

**Marriage Customs.**—CARDS.—*Please inform me if it is correct to send cards without bride-cake?* Quite correct. All changes in marriage customs lately are in the direction of more liberty and more sense.

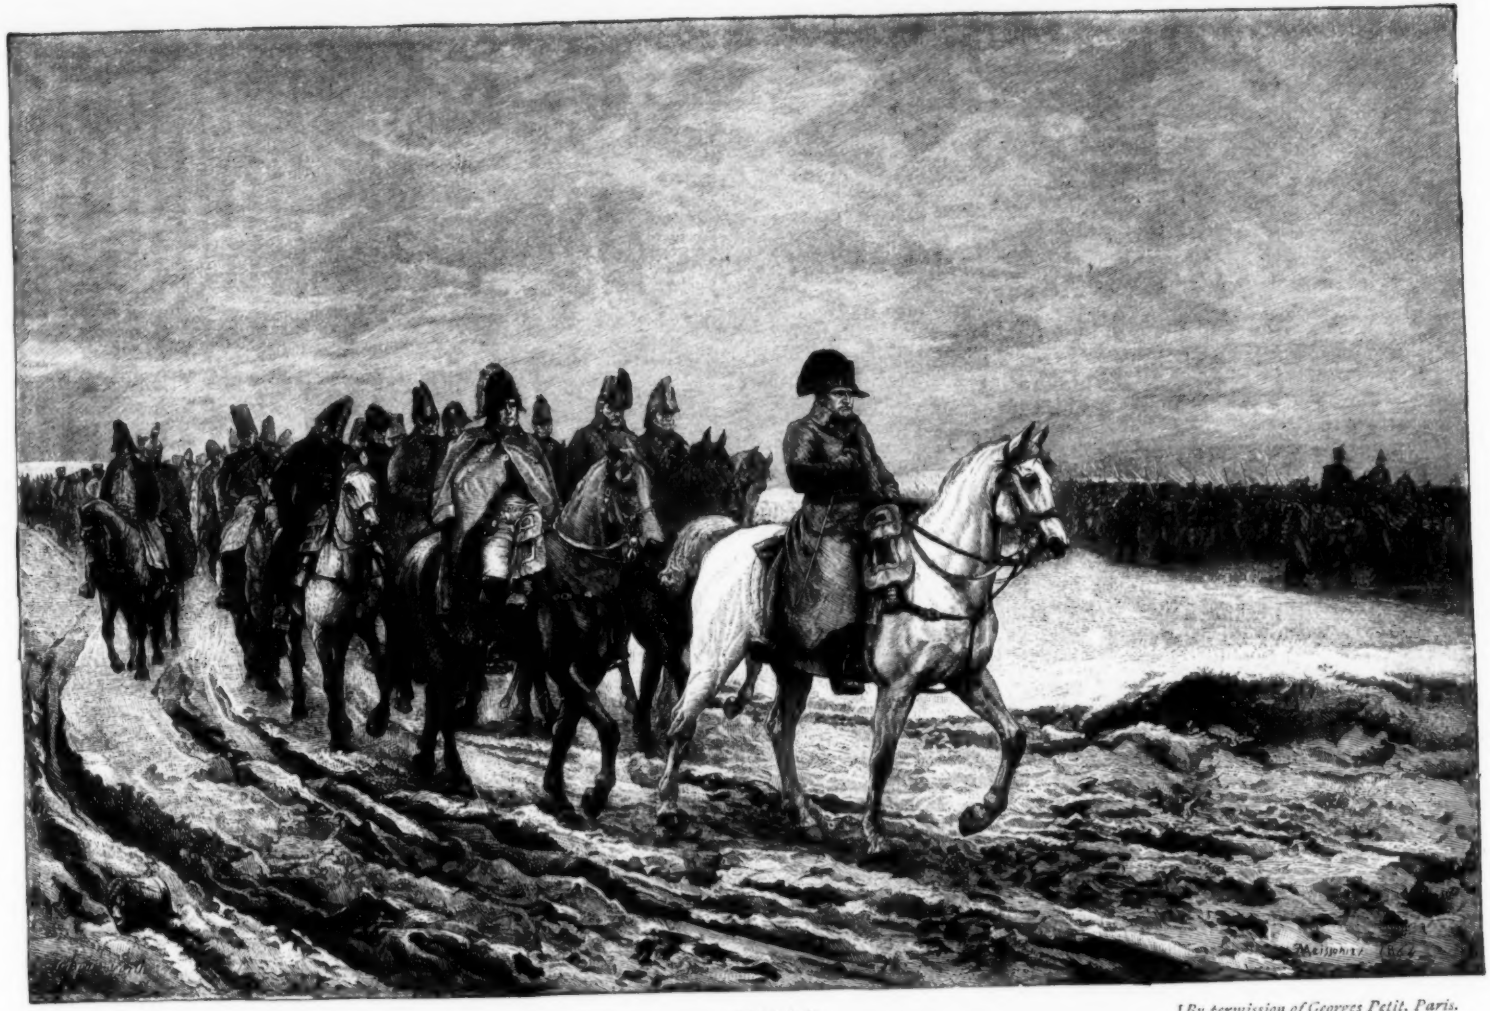
MARKING.—*Should articles like linen, silver, and cutlery marked before marriage be in the gentleman's or lady's name?*—Linen often bears the initial of the wife's *Christian* name, with that and surname of the husband. Otherwise the surname is the husband's. Questions of this kind should be decided by common sense, and marking is for the very purpose of denoting the *family* things belong to. The exceptions are only a few, due to an absurd and foolish, if not wrong, feeling of self-assertion, which augurs ill for the future of those who insist on it.—Your other question is no business of ours.

**India Rubber Plant.**—*Could you kindly inform me as to the treatment of an India Rubber Plant, whether it requires much water and much sun, and when is the proper time for cutting it down, also a good book on fern-growing?*—You should not cut it down at all. It does want water, and there must always be some in the saucer which the pot stands in; also the leaves must have all the dust gently sponged off them every few days. The plant requires literally nothing more, unless it may need re-potting in a larger pot after a while when it has grown. If a strong plant to begin with, and properly established in its pot, hardly anything gives less trouble. You may probably find all you need for the present about ferns in "Ferns and Ferneries," published for sixpence by Marshal, Japp and Co, London. It is handy and practical.

**Parroquets and Love-birds.**—*Will you tell me where I can get a pair of parroquets or love-birds?*—As dependable a dealer as any is Mr. Hawkins, Bear Street, Leicester Square.

**Sorrel Soup.**—*Can you kindly give a receipt for sorrel soup? The French excel in this potage, but you seldom find it in this country. Some years ago the chef at Romano's made a splendid bowl that always gave satisfaction?*—It is not a favourite in England, certainly. The following is a French recipe, but we cannot say if it is the same of which you have such a favourable recollection: Take as many sorrel leaves as will half fill a vegetable dish, blanch them, chop fine, and put them in a saucepan with ½ lb. of butter, 2 quarts of medium stock, and salt and pepper to taste. Boil up gently, and, when boiling, add the yolks of 6 eggs beaten up with a little milk, and a little of the butter saved from the other. Cut a French roll into slices, and pour the soup on them in a tureen.

**Varnishing.**—(1) *Having made a small cabinet out of cedar-wood, I want to know of a nice bright varnish. I don't want to change the colour, just something to give it a brilliant polish.* (2) *What shall I do with a very expensive silver-mounted flute just starting to crack in the middle. I have had it in a very dry place?*—(1) Ask for either pale oak or pale furniture varnish. (2) The flute you had better not meddle with, but take to a shop; you may, however, succeed in filling the crack with thin glue. It must not be kept as you have done.



**Gas Stoves.**—*Can you inform me if there are any gas cooking stoves so arranged that the meat shall not be exposed to the fumes of the gas while cooking; and the upper part of the stove (used for boiling) so shut in that the fumes may not escape and contaminate the air of the whole house, as the one I now have does?*—There are plenty of stoves which roast free from gas fumes, but no "shutting in" can preserve the air from contamination. What does that for a kitchener, and must do it for gas, is to carry the burnt gas away by flues overhead. That is the mistake people make. As to stoves, write to Messrs. Sugg and Sons for a pamphlet.

**Sawdust.**—*Please tell me if the sawdust of the pine would be of any use as a disinfectant, either in small bags or scattered about in rooms?*—It would be quite inoperative, except that it might have some slight tendency to keep away fleas.

---

AFTER THE PICTURE BY MEISSONIER

# THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN, AUTHOR OF THE HOUSE OF THE WOLF, ETC.

I DREW MY SWORD AND ADVANCED TOWARDS HIM.

[By permission of George Petit, Paris.

"1814." AFTER THE PICTURE BY MEISSONIER

## CHAPTER III.—"DOWN WITH PURVEYORS!"

THE first streak of daylight found me already footing it through the forest by paths known to few save the woodcutters, but with which many a boyish exploration had made me familiar. From Coton End the London road lies plain and fair through Stratford-on-Avon and Oxford. But my plan, the better to evade pursuit, was, instead, to cross the forest in a north-easterly direction, and, passing by Warwick, to strike the great north road between Coventry and Daventry, which, running thence south-eastward, would take me as straight as a bird might fly through Dunstable, St. Albans, and Barnet, to London. My baggage consisted only of my cloak, sword, and dagger; and for money I had but a gold angel, and a few silver bits of doubtful value. But I trusted that this store, slender as it was, would meet my charges as far as London. Once there I must depend on my wits, either for providence at home, or a passage abroad.

Striding steadily up and down hill, for Arden Forest is made up of hills and dells, which follow one another as do the wave and trough of the sea, only less regularly, I made my way towards Wootton Wawen. As soon as I espied its battlemented church lying in a wooded bottom below me, I kept a more easterly course, and, leaving Henley-in-Arden far to the left, passed on towards Leek Wootton. The damp dead bracken underfoot, the leafless oaks and grey sky overhead, nay, the very cry of the bittern fishing in the bottoms, seemed to be at one with my thoughts; for these were dreary and sad enough.

But hope and a fixed aim form no bad makeshifts for happiness. Striking the broad London road as I had purposed, I slept that night at Ryton Dunsmoor, and the next at Towcester; and the third day, which rose bright and frosty, found me stepping gaily southward, travel-stained indeed, but dry and whole. My spirits rose with the temperature. For a time I put the past behind me, and

found amusement in the sights of the road; in the heavy wagons and long trains of pack-horses, and the cheery greetings which met me with each mile. After all, I had youth and strength, and the world before me; and particularly Stony Stratford, where I meant to dine.

There was one trouble common among wayfarers which did not touch me; and that was the fear of robbers, for he would be a sturdy beggar who would rob an armed foot-passenger for the sake of an angel; and the groats were gone. So I felt no terrors on that account, and even when about noon I heard a horseman trot up behind me, and rein in his horse so as to keep pace with me at a walk, step for step—a thing which might have seemed suspicious to some—I took no heed of him. I was engaged with my first view of Stratford, and did not turn my head. We had walked on so for fifty paces or more, before it struck me as odd that the man did not pass me.

Then I turned, and shading my eyes from the sun which stood just over his shoulder, said, "Good-day, friend."

"Good-day, master," he answered.

He was a stout fellow, looking like a citizen, although he had a sword by his side, and wore it with an air of importance which the sunshine of opportunity might have ripened into a swagger. His dress was plain; and he sat a good hackney as a miller's sack might have sat it. His face was the last thing I looked at. When I raised my eyes to it, I got an unpleasant start. The man was no stranger. I knew him in a moment for the messenger who had summoned me to the Chancellor's presence.

The remembrance did not please me; and reading in the fellow's sly look that he recognised me, and thought he had made a happy discovery in finding me, I halted abruptly. He did the same.

"It is a fine morning," he said, taken aback by my sudden movement, but affecting an indifference which the sparkle in his eye belied. "A rare day for the time of year."

"It is," I answered, gazing steadily at him.

"Going to London? Or may be only to Stratford?" he hazarded. He fidgeted uncomfortably under my eye, but still pretended ignorance of me.

"That is as may be," I answered.

"No offence, I am sure," he said.

I cast a quick glance up and down the road. There happened to be no one in sight. "Look here!" I replied, stepping forward to lay my hand on the horse's shoulder—but the man reined back and prevented me, thereby giving me a clue to his character—"you are in the service of the Bishop of Winchester?"

His face fell, and he could not conceal his disappointment at being recognised. "Well, master," he answered reluctantly, "perhaps I am, and perhaps I am not."

"That is enough," I said shortly. "And you know me. You need not lie about it, man, for I can see you do. Now look here, Master Steward, or whatever your name may be——"

"It is Master Pritchard," he put in, sulkily; "and I am not ashamed of it."

"Very well. Then let us understand one another. Do you mean to interfere with me?"

He grinned. "Well, to be plain, I do," he replied, reining his horse back another step. "I have orders to look out for you, and have you stopped if I find you. And I must do my duty, sir; I am sworn to it, Master Cludde."

"Right!" said I, calmly; "and I must do mine, which is to take care of my skin." And I drew my sword and advanced upon him with a flourish. "We will soon decide this little matter," I added, grimly, one eye on him and one on the empty road, "if you will be good enough to defend yourself."

But there was no fight in the fellow. By good luck, too, he was so startled that he did not do what he might have done with safety; namely, retreat, and keep me in sight until some passers-by came up. He did give back, indeed, but it was against the bank. "Have a care!" he cried in a fume, his eye following my sword nervously: he did not try to draw his own. "There is no call for fighting, I say."

"But I say there is," I replied, bluntly. "Call and cause! Either you fight me, or I go where I please."

"You may go to Bath for me!" he spluttered, his face the colour of a turkey-cock's wattles with rage.

"Do you mean it, my friend?" I said, and I played my point about his leg, half-minded to give him a little prod by way of earnest. "Make up your mind."

"Yes!" he shrieked out, suspecting my purpose, and bouncing about in his saddle like a parched pea. "Yes, I say!" he roared. "Do you hear me? You go your way, and I will go mine."

"That is a bargain," I said quietly; "and mind you keep to it."

I put up my sword with my face turned from him, lest he should see the curl of my lip and the light in my eyes. In truth, I was uncommonly well pleased with myself, and was thinking that if I came through all my adventures as well, I should do merrily. Outwardly, however, I tried to ignore my victory, and to make things as easy as I could for my friend—if one may call a man who will not fight him a friend, a thing I doubt. "Which way are you going?" I asked amicably; "to Stratford?"

He nodded, for he was too sulky to speak.

"All right!" I said cheerfully, feeling that my dignity could take care of itself now. "Then so far we may go together. Only do you remember the terms. After dinner each goes his own way."

He nodded again, and we turned, and went on in silence, eyeing one another askance, like two ill-matched dogs coupled together. But, luckily, our forced companionship did not last long, a quarter of a mile and a bend in the road bringing us to the first low, grey houses of Stratford; a long, straggling village it seemed, made up of inns strewn along the road, like beads threaded on a rosary. And to be sure, to complete the likeness, we came presently upon an ancient stone cross standing on the green, I pulled up in front of this with a sigh of pleasure. for on either side of it, one facing the other, was an inn of the better class.

"Well," I said, "which shall it be? The Rose and Crown, or the Crown without the Rose?"

"Choose for yourself," he answered churlishly. "I go to the other."

I shrugged my shoulders. After all, you cannot make a silk purse out of a sow's ear, and if a man has not courage he is not likely to have good fellowship. But the words angered me, nevertheless, for a shabby, hulking fellow lounging at my elbow overheard them and grinned; a hiccoughing, blear-eyed man he was as I had ever met, with a red nose and the rags of a tattered cassock about him. I turned away in annoyance, and chose the "Crown" at hazard; and pushing my way through a knot of horses that stood tethered at the door, went in, leaving the two to their devices.

I found a roaring fire in the great room, and three or four yeomen standing about it, drinking ale. But I was hot from walking, so, after saluting them and ordering my meal, I went and sat for choice on a bench by the window away from the fire. The window was one of a kind common in Warwickshire houses; long and low and beetle-browed, the storey above projecting over it. I sat here a minute looking idly out at the inn opposite, a heavy stone building with a walled courtyard attached to it; such an inn as was common enough about the time of the Wars of the Roses, when wayfarers looked rather for safety than comfort. Presently I saw a boy come out of it and start up the road at a run. Then, a minute later, the ragged fellow I had seen on the green came out and lurched across the road. He seemed to be making, though uncertainly, for my inn, and, sure enough, just as my bread and bacon—the latter hot and hissing—were put before me, he staggered into the room, bringing a strong smell of ale and onions with him. "*Pax vobiscum!*" he said, leering at me with tipsy solemnity.

I guessed what he was—a monk, one of those unfortunates still to be found here and there up and down the country, whom King Henry, when he put down the monasteries, had made homeless. I did not look on the class with much favour, thinking that for most of them the cloister, even if the Queen should succeed in setting the abbeys on their legs again, would have now few attractions. But I saw that the simple farmers received his scrap of Latin with respect, and I nodded civilly as I went on with my meal.

I was not to get off so easily, however. He came and planted himself opposite to me.

"*Pax vobiscum*, my son," he repeated. "The ale is cheap here, and good."

"So is the ham, good father," I replied cheerfully, not pausing in my attack on the victuals. "I will answer for so much."

"Well, well," the knave replied with ready wit, "I breakfasted early. I am content. Landlord, another plate and a full tankard. The young gentleman would have me dine with him."

I could not tell whether to be angry or to laugh at his impudence.

"The gentleman says he will answer for it!" repeated the rascal, with a twinkle in his eye, as the landlord hesitated. He was by no means so drunk as he looked.

"No, no, father," I cried, joining in the general laugh into which the farmers by the fire broke. "A cup of ale is in reason, and for that I will pay, but for no more. Drink it, and wish me Godspeed."

"I will do more than that, lad," he answered. Swaying to and fro my cup which he had seized in his grasp, he laid his hand on the window-ledge beside me, as though to steady himself, and stooped until his coarse puffy face was but a few inches from mine. "More than that," he whispered hoarsely; and his eyes peering into mine were now sober and full of meaning. "If you do not want to be put in the stocks or worse, make tracks! Make tracks, lad!" he continued. "Your friend over there—

"SO THE WORD IS—GO."

he is a niggardly oaf—has sent for the hundredman and the constable, and you are the quarry. So the word is, Go! That," he added aloud, standing erect again, with a drunken smile, "is for your cup of ale; and good coin too!"

For half a minute I sat quite still; taken aback, and wondering, while the bacon cooled on the plate before me, what I was to do. I did not doubt the monk was telling the truth. Why should he lie to me? And I cursed my folly in trusting to a coward's honour, or a serving-man's good faith. But lamentations were useless. What was I to do? I had no horse, and no means of getting one. I was in a strange country, and to try to escape on foot from pursuers who knew the roads, and had the law on their side, would be a hopeless undertaking. Yet to be haled back to Coton End a prisoner—I could not face that. Mechanically I raised a morsel of bacon to my lips, and as I did

so, a thought occurred to me—an idea suggested by some talk I had heard the evening before at Towcester.

Fanciful as the plan was, I snatched at it; and knowing each instant to be precious, took my courage in my hand—and my tankard. "Here," I cried, speaking suddenly and loudly, "here is bad luck to purveyors, Master Host!"

There were a couple of stablemen within hearing, lounging in the doorway, besides the landlord and his wife and the farmers. A villager or two also had dropped in, and there were two pedlars lying half asleep in the corner. All these pricked up their ears more or less at my words. But, like most country folk, they were slow to take in anything new or unexpected; and I had to drink afresh and say again, "Here is bad luck to purveyors!" before any one took it up.

Then the landlord showed he understood.

"Ay, so say I!" he cried, with an oath. "Purveyors, indeed! It is such as they give the Queen a bad name!"

"God bless her!" quoth the monk, loyally.

"And drown the purveyors!" a farmer exclaimed.

"They were here a year ago, and left us as bare as a shorn sheep," struck in a strapping villager, speaking at a white heat, but telling me no news; for this was what I had heard at Towcester the night before. "The Queen should lie warm if she uses all the wool they took! And the pack-horses they purveyed to carry off the plunder—why, the packmen avoid Stratford ever since as though we had the Black Death! Oh, down with the purveyors, say I! The first that comes this way I will show the bottom of the Ouse. Ay, that I will, though I hang for it!"

"Easy! easy, Tom Miller!" the host interposed, affecting an air of assurance, even while he cast an eye of trouble at his flitches. "It will be another ten years before they harry us again. There is Potter's Pury! They never took a tester's worth from Potter's Pury! No, nor from Preston Gobion! But they will go to them next, depend upon it!"

"I hope they will," I said, with a world of gloomy insinuation in my words. "But I doubt it!"

And this time my hint was not wasted. The landlord changed colour. "What are you driving at, master?" he asked timidly, while the others looked at me in silence and waited for more.

"What if there be one across the road now?" I said, giving way to the temptation, and speaking falsely—for which I paid dearly afterwards. "A purveyor, I mean, unless I am mistaken in him, or he tells lies. He has come straight from the Chancellor, white wand, warrant, and all. He is taking his dinner, now, but he has sent for the hundredman, so I guess he means business."

"For the hundredman?" repeated the landlord, his brows meeting.

"Yes; unless I am mistaken."

There was silence for a moment. Then the man they called Tom Miller dashed his cap on the floor and, folding his arms defiantly, looked round on his neighbours. "He has come, has he!" he roared, his face swollen, his eyes bloodshot. "Then I will be as good as my word! Who will help? Shall we sit down and be shorn like sheep, as we were before, so that our children lay on the bare stones, and we pulled the plough ourselves? Or shall we show that we are free Englishmen, and not slaves of Frenchmen? Shall we teach Master Purveyor not to trouble us again? Now, what say you, neighbours?"

So fierce a growl of impatience and anger rose round me as at once answered the question. A dozen red faces glared at me and at one another, and from the very motion and passion of the men as they snarled and threatened, the room seemed twice as full as it was. Their oaths and cries of encouragement, not loud, but the more dangerous for that, the fresh burst of fury which rose as the village smith and another came in and learned the news, the menacing gestures of a score of brandished fists—these sights, though they told of the very effect at which I had aimed, scared as well as pleased me. I turned red and white, and hesitated, fearing that I had gone too far.

The thing was done, however; and, what was more, I had soon to take care of myself. At the very moment when the hubbub was at its loudest I felt a chill run down my back as I met the monk's eye, and, reading in it whimsical admiration, read in it something besides, and that was an unmistakable menace. "Clever lad!" the eye said. "I will expose you," it threatened.

I had forgotten him—or, at any rate, that my acting would be transparent enough to him holding the clue in his hand—and his look was like the shock of cold water to me. But it is wonderful how keen the wits grow on the grindstone of necessity. With scarcely a second's hesitation I drew out my only piece of gold, and unnoticed by the other men, who were busy swearing at and encouraging one another, I disclosed a morsel of it. The monk's crafty eye glistened. I laid my finger on my lips.

He held up two fingers.

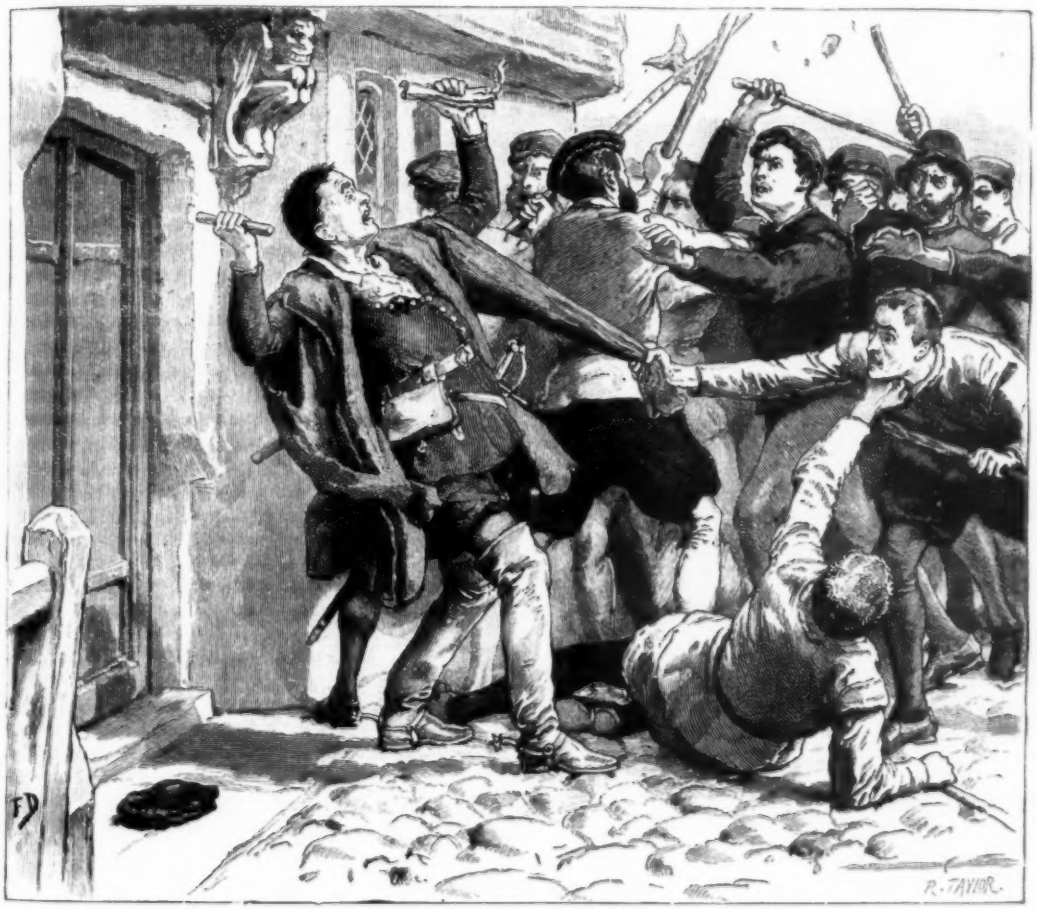
I shook my head and showed an empty palm. I had no more. He nodded; and the relief that nod gave me was great. Before I had time, however, to consider the narrowness of my escape, a movement of the crowd—for the news had spread with strange swiftness, and there was now a crowd assembled which more than filled the room—proclaimed that the purveyor had come out, and was in the street.

The room was nearly emptied at a rush. Though I prudently remained behind, I could, through the open window, hear as well as see what passed. The leading spirits had naturally struggled out first, and were gathered sullen, and full of dangerous possibilities, about the porch.

I suppose the Bishop's messenger saw in them nothing but a crowd of country clowns, for he came hectoring towards the door, smiting his boot with his whip, and puffing out his red cheeks mightily. He felt brave enough now that he had dined and had at his back three stout constables sworn to keep the Queen's peace.

"Make way! Make way, there, do you hear?" he cried, in a husky, pompous voice. "Make way!" he repeated, lightly touching the nearest

man with his switch. "I am on the Queen's service, boobies, and must not be hindered."



The man swore at him, but did not budge, and the bully, brought up thus sharply, awoke to the lowering faces and threatening looks which confronted him. He changed colour a little. But the ale was still in him, and, forgetting his natural discretion, he thought to carry matters with a high hand. "Come! come!" he exclaimed angrily. "I have a warrant, and you resist me at your peril. I have to enter this house. Clear the way, Master Hundredman, and break these fellows' heads if they withstand you."

"What man?" quoth Tom Miller, eyeing him fixedly.

"The stranger who came in an hour ago, and is inside the house."

"Him, he means, who told about the purveyor across the road," explained the monk with a wink.

That wink sufficed. There was a roar of execration, and in the twinkling of an eye the Jack-in-office, tripped up this way and shoved that, was struggling helplessly in the grasp of half-a-dozen men, who fought savagely for his body with the Hundredman and constables.

I CAUGHT A GLIMPSE OF HIM, WILD-EYED AND FRANTIC WITH FEAR.

A growl as of a dozen bull-dogs answered him, and he drew back, as a child might who has trodden on an adder. "You fools!" he spluttered, glaring at them viciously. "Are you mad? Do you know what you are doing? Do you see this?" He whipped out from some pocket a short white staff and brandished it. "I come direct from the Lord Chancellor and upon his business, do you hear, and if you resist me it is treason. Treason! you dogs!" he cried, his rage getting the better of him, "and like dogs you will hang for it. Master Hundredman, I order you to take in your constables and arrest that man!"

"To the river! To the Ouse with him!" yelled the mob. "In the Queen's name!" shouted the officers. But these were to those as three to a score, and taken by surprise besides, and doubtful of the rights of the matter. Yet for an instant, as the crowd went reeling and fighting down the road, they prevailed; the constables managed to drag their leader free, and I caught a glimpse of him, wild-eyed and frantic with fear, his clothes torn from his back, standing at bay like some animal, and brandishing his staff in one hand, a packet of letters in the other.

"I have letters, letters of state!" he screamed

shrilly. "Let me alone, I tell you! Let me go, you curs!"

But in vain. The next instant the mob were upon him again. The packet of letters went one way, the staff was dashed another. He was thrown down and plucked up again, and hurried, bruised and struggling, towards the river, his screams for mercy and furious threats rising shrilly above the oaths and laughter.

I felt myself growing pale as scream followed scream. "They will kill him!" I exclaimed, trembling and preparing to follow. "I cannot see this done."

But the monk, who had returned to my side, grasped my arm. "Don't be a fool," he said sharply. "I will answer for it they will not kill him. Tom Miller is not a fool, though he is angry. He will duck him, and let him go. But I will trouble you for that bit of gold, young gentleman."

I gave it to him.

"Now," he continued with a leer, "I will give you a hint in return. If you are wise, you will be out of this county in twelve hours. Tethered to the gate over there is a good horse which belongs to a certain purveyor now in the river. Take it! There is no one to say you nay. And begone!"

I looked hard at him for a minute, my heart beating fast. This was horse-stealing. And horse-stealing was a hanging matter. But I had done so much already that I felt I might as well be hanged for a sheep as for a lamb. I was not sure that I had not incited to treason, and what was stealing a horse beside that? "I will do it!" I said desperately.

"Don't lose time, then," quoth my mentor.

I went out then and there, and found he had told the truth. Every soul in the place had gone to see the ducking, and the street was empty. Kicked aside in the roadway lay the bundle of letters, soiled but not torn, and in the gutter was the staff. I stooped and picked up one and the other—in for a lamb, in for a sheep! and they might be useful some day. Then I jumped into the saddle, and twitched the rein off the hook.

But before I could drive in the spurs, a hand fell on the bridle, and the monk's face appeared at my knee. "Well?" I said, glaring down at him—I was burning to be away.

"That is a good cloak you have got there," he muttered hurriedly. "There, strapped to the saddle, you fool. You do not want that, give it me. Do you hear? Quick, give it me," he cried, raising his voice and clutching at it fiercely, his face dark with greed and fear.

"I see," I replied, as I unstrapped it. "I am to steal the horse that you may get the cloak. And then you will lay the lot on my shoulders. Well, take it!" I cried, "and go your way as fast as you can."

Throwing it at him as hard as I could, I shook up the reins and went off down the road at a gallop. The wind whistled pleasantly past my ears. The sounds of the town grew faint and distant. Each bound of the good hack carried me farther and farther from present danger, farther and farther from the old life. In the exhilaration and excitement of the moment I forgot my condition; forgot that I had not a penny-piece in my pocket, and that I had left an unpaid bill behind me; forgot even that I rode a—well, a borrowed horse.

### CHAPTER IV.—TWO SISTERS OF MERCY.

A YOUNGER generation has often posed me finely by asking, "What, Sir Francis! Did you not see *one* bishop burned? Did you not know *one* of the martyrs? Did you *never* come face to face with Queen Mary?" To all which questions I have one answer, No, and I watch small eyes grow large with astonishment. But the truth is, a man can only be in one place at a time. And though, in this very month of February 1555, Prebendary Rogers—a good, kindly man, as I have heard, who had a wife and nine children—was burned in Smithfield in London for religion, and the Bishop of Gloucester suffered in his own city, and other inoffensive men were burned to death, and there was much talk of these things, and in thousands of breasts a smouldering fire was kindled which blazed high enough by-and-by—why, I was at Coton End, or on the London Road, at the time, and learned such things only dimly and by hearsay.

But the rill joins the river at last; and ofttimes suddenly and at a bound, as it were. On this very day, while I cantered easily southward with my face set towards St. Albans, Providence was at work shaping a niche for me in the lives of certain people who were at the time as unconscious of my existence as I was of theirs. In a great house in the Barbican in London there was much stealthy going and coming on this February afternoon and evening. Behind locked doors, and in fear and trembling, mails were being packed and bags strapped, and fingers almost too delicate for the task were busy with nails and hammers, securing this and closing that. The packers knew nothing of me, nor I of them. Yet but for me all that packing would have been of no avail; and but for them my fate might have been very different. Still, the sound of the hammer did not reach my ears, or, doing so, was covered by the steady tramp of the roadster; and no vision, so far as I ever heard, of a dusty youth riding Londonwards came between the secret workers and their task.

I had made up my mind to sleep at St. Albans that night, and for this reason, and for others relating to the Sheriff of Buckinghamshire, in which county Stony Stratford lies, I pushed on briskly. I presently found time, however, to examine the packet of letters of which I had made spoil. On the outer wrapper I found there was no address, only an exhortation to be speedy. Off this came, therefore, without ceremony, and was left in the dirt. Inside I found two sealed epistles, each countersigned on the wrapper, "Stephen Winton."

"Ho! ho!" said I. "I did well to take them."

Over the signature on the first letter—it seemed to be written on parchment—were the words, "Haste! haste! haste!" This was the thicker and heavier of the two, and was addressed to Sir Maurice Berkeley, at St. Mary Overy's, Southwark,

London. I turned it over and over in my hands, and peeped into it, hesitating. Twice I muttered, "All is fair in love and war!" And at last, with curiosity fully awake, and a glance behind me to make sure that the act was unobserved, I broke the seal. The document proved to be as short and pithy as it was startling. It was an order commanding Sir Maurice Berkeley forthwith in the Queen's name, and by the authority of the Council, and so on, and so on, to arrest Katherine Willoughby de Eresby, Duchess of Suffolk, and to deliver her into the custody of the Lieutenant of the Tower, "These presents to be his warranty for the detention of the said Duchess of Suffolk until her Grace's pleasure in the matter be known."

When it was too late I trembled to think what I had done. To meddle with matters of State might be more dangerous a hundred times than stealing horses, or even than ducking the Chancellor's messenger! Seeing at this moment a party of travellers approach, I crammed the letter into my pocket, and rode by them with a red face, and a tongue that stuttered so feebly that I could scarcely return their greetings. When they had gone by I pulled out the warrant again, having it in my mind to tear it up without a moment's delay—to tear it into the smallest morsels, and so get rid of a thing most dangerous. But the great red seal dangling at the foot of the parchment caught my eye, and I paused to think. It was so red, so large, so imposing, it seemed a pity to destroy it. It must surely be good for something. I folded up the warrant again, and put it away in my safest pocket. Yes, it might be good for something.

I took out the other letter. It was bound with green ribbon and sealed with extreme care, being directed simply to Mistress Clarence—there was no address. But over Gardiner's signature on the wrapper were the words, "These, on your peril, very privately."

I turned it over and over, and said the same thing about love and war, and even repeated to myself my old proverb about a sheep and a lamb. But somehow I could not do it. The letter was a woman's letter; the secret, her secret; and though my fingers itched as they hovered about the seals, my cheek tingled too. So at last, with a muttered "What would Petronilla say?" I put it away unopened in the pocket where the warrant lay. The odds were immense that Mistress Clarence would never get it; but at least her secret should remain hers, and my honour mine!

It was dark when I rode, thoroughly jaded, into St. Albans. I was splashed with mud up to the waist, and wetted by a shower, and looked, I have no doubt, from the effect of my journeying on foot and horseback, as disreputable a fellow as might be. The consciousness too that I was without a penny, and the fear lest, careful as I had been to let no one outstrip me, the news of the riot at Stratford might have arrived, did not tend to give me assurance. I poked my head timidly into the great room, hoping that I might have it to myself. To my disgust it was full of people. Half-a-dozen travellers and as many townsfolk were sitting round the fire, talking briskly over their evening draught. Yet I had no choice. I was hungry, and the thing had to be done, and I swaggered in, something of the sneak, no doubt, peeping through my bravado. I remarked, as I took my seat by the fire and set to drying myself, that I was greeted by a momentary silence, and that two or three of the company began to eye me suspiciously.

There was one man, who sat on the settle in the warmest corner of the chimney, who seemed in particular to resent my damp neighbourhood. His companions treated him with so much reverence, and he snubbed them so regularly, that I wondered who he was; and presently, listening to the conversation which went on round me, I had my curiosity satisfied. He was no less a personage than the Bailiff of St. Albans, and his manner befitted such a man; for it seemed to indicate that he thought himself heir to all the powers of the old Abbots under whose broad thumb his father and grandfather had groaned.

NO LESS A PERSONAGE THAN THE BAILIFF OF ST. ALBANS.

My conscience pricking me, I felt some misgiving when I saw him, after staring at me and whispering to two or three of his neighbours, beckon the landlord aside. His big round face and burly figure gave him a general likeness to bluff King Hal, and he appeared to be aware of this himself, and to be inclined to ape the stout king's ways, which, I have heard my uncle say, were ever ways heavy for others' toes. For awhile, however, seeing my supper come in, I forgot him. The bare-armed girl who brought it to me, and in whom my draggled condition seemed to provoke feelings of a different nature, lugged up a round table to the fire. On this she laid my meal, not scrupling to set aside some of the snug dry townsfolk. Then she set a chair for me well in the blaze, and folding

her arms in her apron stood to watch me fall to. I did so with a will, and with each mouthful of beef and draught of ale, spirit and strength came back to me. The cits round me might sneer and shake their heads, and the travellers smile at my appetite. In five minutes I cared not a whit! I could give them back joke for joke, and laugh with the best of them.

Indeed, I had clean forgotten the Bailiff, when he stalked back to his place. But the moment our eyes met, I guessed there was trouble afoot. The landlord came with him and stood looking at me, sending off the wench with a flea in her ear; and I felt under his eye an uncomfortable consciousness that my purse was empty. Two or three late arrivals, to whom I suppose Master Bailiff had confided his suspicions, took their stand also in a half-circle and scanned me queerly. Altogether it struck me suddenly that I was in a tight place, and had need of my wits.

"Ahem!" said the Bailiff, abruptly, taking skilful advantage of a lull in the talk. "Where from last, young man?" He spoke in a deep choky voice, and, if I was not mistaken, winked one of his small eyes in the direction of his friends, as though to say, "Now see me pose him!"

But I only put another morsel in my mouth. For a moment indeed the temptation to reply "Towcester," seeing that such a journey over a middling road was something to brag of before the Highway Law came in, almost overcame me. But in time I bethought me of Stephen Gardiner's maxim, "Be slow to speak!" and I put another morsel in my mouth.

The Bailiff's face grew red, or rather, redder. "Come, young man, did you hear me speak?" he said pompously. "Where from last?"

"From the road, sir," I replied, turning to him as if I had not heard him before. "And a very wet road it was."

A man who sat next me chuckled, being apparently a stranger like myself. But the Bailiff puffed himself into a still more striking likeness to King Henry, and including him in his scowl shouted at me, "Sirrah! don't bandy words with me! Which way did you come along the road, I asked."

It was on the tip of my tongue to answer saucily, "The right way!" But I reflected that I might be stopped; and to be stopped might mean to be hanged at worst, and something very unpleasant at best. So I controlled myself, and answered—though the man's arrogance was provoking enough—"I have come from Stratford, and I am going to London. Now you know as much as I do."

"Do I?" he said, with a sneer and a wink at the landlord.

"Yes, I think so," I answered patiently.

"Well, I don't!" he retorted, in vulgar triumph. "I don't. It is my opinion that you have come from London."

I went on with my supper.

"Do you hear?" he asked pompously, sticking his arms akimbo and looking round for sympathy. "You will have to give an account of yourself, young man. We will have no penniless rogues and sturdy vagabonds wandering about St. Albans."

"Penniless rogues do not go a-horseback," I answered. But it was wonderful how my spirits sank again under that word "penniless." It hit me hard.

"Wait a bit," he said, raising his finger to command attention for his next question. "What is your religion, young man?"

"Oh!" I replied, putting down my knife and looking open scorn at him, "you are an inquisitor, are you?" At which words of mine there was a kind of stir. "You would burn me as I hear they burned Master Sandars at Coventry last week, would you? They were talking about it down the road."

"You will come to a bad end, young man!" he retorted viciously, his outstretched finger shaking as if the palsy had seized him. For this time my taunt had gone home, and more than one of the listeners standing on the outer edge of the group, and so beyond his ken, had muttered shame. More than one face had grown dark. "You will come to a bad end!" he repeated. "If it be not here, then somewhere else! It is my opinion that you have come from London, and that you have been in trouble. There is a hue-and-cry out for a young fellow just your age, and a cock of your hackle, I judge, who is wanted for heresy. A Londoner too. You do not leave here until you have given an account of yourself, Master Jack-a-Dandy!" The party had all risen round me, and some of the hindmost had got on benches to see me the better. Among these, between two bacon flitches, I caught a glimpse of the serving-maid's face as she peered at me, pale and scared, and a queer impulse led me to nod to her—a reassuring little nod. I found myself growing cool and confident, seeing myself so cornered.

"Easy! easy!" I said, "let a man finish his supper and get warmed in peace."

"Bishop Bonner will warm you!" cried the Bailiff.

"I dare say—as they warm people in Spain!" I sneered.

"He will be Bishop Burner to you!" shrieked the Bailiff, almost beside himself with rage at being so bearded by a lad.

"Take care!" I retorted. "Do not you speak evil of dignitaries, or you will be getting into trouble!"

He fairly writhed under this rejoinder.

"Landlord!" he spluttered, "I shall hold you responsible! If this person leaves your house, and is not forthcoming when wanted, you will suffer for it!"

The landlord scratched his head, being a good-natured fellow; but a bailiff is a bailiff, especially at St. Albans. And I was muddy and travel-stained, and quick of my tongue for one so young; which the middle-aged never like, though the old bear it better. He hesitated.

"Do not be a fool, Master Host!" I said. "I have something here—" and I touched my pocket, which happened to be near my sword-hilt—"that will make you rue it if you interfere with me!"

"Ho! ho!" cried the Bailiff, in haste and triumph. "So that is his tone! We have a tavern-brawler here, have we! A young swash-buckler! His tongue will not run so fast when

he finds his feet in the stocks. Master landlord, call the watch! Call the watch at once, I command you!"

"You will do so at your peril!" I said sternly. Then, seeing that my manner had some effect upon all save the angry official, I gave way to the temptation to drive the matter home and secure my safety by the only means that seemed possible. It is an old story that one deception leads inevitably to another. I solemnly drew out the white staff I had taken from the apparitor. "Look here!" I continued, waving it. "Do you see this, you booby? I am travelling in the Queen's name, and on her service. By special commission, too, from the Chancellor! Is that plain speaking enough for you? And let me tell you, Master Bailiff," I added, fixing my eye upon him, "that my business is private, and that my Lord of Winchester will not be best pleased when he hears how I have had to declare myself. Do you think the Queen's servants go always in cloth of gold, you fool? The stocks indeed!"

I laughed out loudly and without effort, for there never was anything so absurd as the change in the Bailiff's visage. His colour fled, his cheeks grew pendulous, his lip hung loose. He stared at me, gasping like a fish out of water, and seemed unable to move toe or finger. The rest enjoyed the scene, as people will enjoy a marvellous sudden stroke of fortune. It was as good as a stage pageant to them. They could not take their eyes from the pocket in which I had replaced my wand, and continued, long after I had returned to my meal, to gaze at me in respectful silence. The crestfallen Bailiff presently slipped out, and I was left cock of the walk, and for the rest of the evening enjoyed the fruits of victory.

They proved to be more substantial than I had expected, for, as I was on my way upstairs to bed, the landlord preceding me with a light, a man accosted me, and beckoned me aside mysteriously.

"The Bailiff is very much annoyed," he said, speaking in a muffled voice behind his hand while his eyes peered into mine.

"Well, what is that to me?" I replied, looking sternly at him. I was tired and sleepy after my meal. "He should not make such a fool of himself."

"Tut, tut, tut, tut! You misunderstand me, young sir," the man answered, plucking my sleeve as I turned away. "He regrets the annoyance he has caused you. A mistake, he says, a pure mistake, and he hopes you will have forgotten it by morning." Then, with a skilful hand which seemed not unused to the task, he slid two coins into my palm.

I looked at them, for a moment not perceiving his drift. Then I found they were two gold angels, and I began to understand. "Ahem!" I said, fingering them uneasily. "Yes. Well, well, I will look over it, I will look over it! Tell him from me," I continued, gaining confidence as I proceeded with my new rôle, "that he shall hear no more about it. He is zealous—perhaps over zealous!"

"That is it!" muttered the envoy, eagerly; "that is it, my dear sir! You see perfectly how it is. He is zealous. Zealous in the Queen's service!"

"To be sure; and so I will report him. Tell him that so I will report him. And here, my good friend, take one of these for yourself," I added, magnificently giving him back half my fortune—young donkey that I was. "Drink to the Queen's health; and so good-night to you."

He went away, bowing to the very ground, and, when the landlord likewise had left me, I was very merry over this, being in no mood for weighing words. The world seemed—to be sure, the ale was humming in my head, and I was in the landlord's best room—easy enough to conquer, provided one possessed a white staff. The fact that I had no right to mine only added—be it remembered I was young and foolish—to my enjoyment of its power. I went to bed in all comfort with it under my pillow, and slept soundly, untroubled by any dream of a mischance. But when did a lie ever help a man in the end?

When I awoke, which I seemed to do on a sudden, it was still dark. I wondered for a moment where I was, and what was the meaning of the shouting and knocking I heard. Then, discerning the faint outline of the window, I remembered the place in which I had gone to bed, and I sat up and listened. Some one—nay, several people were drumming and kicking against the wooden doors of the inn-yard, and shouting besides, loud enough to raise the dead. In the next room to mine I caught the grumbling voices of persons disturbed, like myself, from sleep. And by-and-by a window was opened, and I heard the landlord ask what was the matter.

"In the Queen's name!" came the loud, impatient answer, given in a voice that rose above the ring of bridles and the stamping of iron hoofs, "open! and that quickly, Master Host. The watch are here, and we must search."

I waited to hear no more. I was out of bed, and huddling on my clothes, and thrusting my feet into my boots, like one possessed. My heart was beating as fast as if I had been running in a race, and my hands were shaking with the shock of the alarm. The impatient voice without was Master Pritchard's, and it rang with all the vengeful passion which I should have expected that gentleman, duped, ducked, and robbed, to be feeling. There would be little mercy to be had at his hands. Moreover, my ears, grown as keen for the moment as the hunted hare's, distinguished the tramping of at least half-a-dozen horses, so that it was clear that he had come with a force at his back. Resistance would be useless. My sole chance lay in flight—if flight should still be possible.

Even in my haste I did not forsake the talisman which had served me so well, but stayed an instant to thrust it into my pocket. The Cluddes have, I fancy, a knack of keeping cool in emergencies, getting, indeed, the cooler the greater the stress.

By this time the inn was thoroughly aroused. Doors were opening and shutting on all sides of me, and questions were being shouted in different tones from room to room. In the midst of the hubbub I heard the landlord come out muttering, and go downstairs to open the door. Instantly

I unlatched mine, slipped through it stealthily, sneaked a step or two down the passage, and then came plump in the dark against some one who was moving as softly as myself. The surprise was complete, and I should have cried out at the unexpected collision had not the unknown laid a cold hand on my mouth, and gently pushed me back into my room.

Here there was now a faint glimmer of dawn, and by this I saw that my companion was the serving-

MY SOLE CHANCE LAY IN FLIGHT

maid. "Hist!" she said, speaking under her breath, "Is it you they want?"

I nodded.

"I thought so," she muttered. "Then you must get out through your window. You cannot pass them. They are a dozen or more, and armed. Quick! knot this about the bars. It is no great depth to the bottom, and the ground is soft from the rain"

She tore, as she spoke, the coverlet from the bed, and twisting it into a kind of rope helped me to secure one corner of it about the window-bar. "When you are down," she whispered, "keep along the wall to the right until you come to a haystack. Turn to the left there—you will have to ford the water—and you will soon be clear of the town. Look about you then, and you will see a horse-track, which leads to Elstree, running in a line with the London Road, but a mile from it and through woods. At Elstree any path to the left will take you to Barnet, and not two miles lost."

"Heaven bless you!" I said, turning from the gloom, the dark sky, and driving scud without to peer gratefully at her. "Heaven bless you for a good woman!"

"And God keep you for a bonny boy," she whispered.

I kissed her, forcing into her hands—a thing the remembrance of which is very pleasant to me to this day—my last piece of gold.

A moment more, and I stood unhurt, but almost up to my knees in mud, in an alley bounded on both sides, as far as I could see, by blind walls. Stopping only to indicate by a low whistle that I was safe, I turned and sped away as fast as I could run in the direction which she had pointed out. There was no one abroad, and in a shorter time than I had expected I found myself outside the town, travelling over a kind of moorland tract bounded in the distance by woods.

Here I picked up the horse-track easily enough, and without stopping, save for a short breathing space, hurried along it, to gain the shelter of the trees. So far so good! I had reason to be thankful. But my case was still an indifferent one. More than once in getting out of the town I had slipped and fallen. I was wet through, and plastered with dirt owing to these mishaps; and my clothes were in a woeful plight. For a time excitement kept me up, however, and I made good way, warmed by the thought that I had again baffled the great Bishop. It was only when the day had come, and grown on to noon, and I saw no sign of any pursuers, that thought got the upper hand. Then I began to compare, with some bitterness of feeling, my present condition—wet, dirty, and homeless—with that which I had enjoyed only a week before; and it needed all my courage to support me. Skulking, half famished, between Barnet and Tottenham, often compelled to crouch in ditches or behind walls while travellers went by, and liable each instant to have to leave the highway and take to my heels, I had leisure to feel; and I did feel, more keenly, I think, that afternoon than at any later time, the bitterness of fortune. I cursed Stephen Gardiner a dozen times, and dared not let my thoughts wander to my father. I had said that I would build my house afresh. Well, truly I was building it from the foundation.

It added very much to my misery that it rained all day a cold, half-frozen rain. The whole afternoon I spent in hiding, shivering and shaking in a hole under a hedge near Tottenham: being afraid to go into London before nightfall, lest I should be waited for at the gate and be captured. Chilled

and bedraggled as I was, and weak through want of food which I dared not go out to beg, the terrors of capture got hold of my mind and presented to me one by one every horrible form of humiliation, the stocks, the pillory, the cart-tail. So that even Master Pritchard, could he have seen me and known my mind, might have pitied me; so that I loathe to this day the hours I spent in that foul hiding-place. Between a man's best and worse, there is little but a platter of food.

The way this was put an end to, I well remember. An old woman came into the field where I lay hid, to drive home a cow. I had had my eyes on this cow for at least an hour, having made up my mind to milk it for my own benefit as soon as the dusk fell. In my disappointment at seeing it driven off, and also out of a desire to learn whether the old dame might not be going to milk it in a corner of the pasture, in which case I might still get an after-taste, I crawled so far out of my hole that, turning suddenly, she caught sight of me. I expected to see her hurry off, but she did not. She took a long look, and then came back towards me, making, however, as it seemed to me, as if she did not see me. When she had come within a few feet of me, she looked down abruptly, and our eyes met. What she saw in mine I can only guess. In hers I read divine pity. "Oh, poor lad!" she murmured; "oh, you poor, poor lad!" and there were tears in her voice.

I was so weak—it was almost twenty-four hours since I had tasted food, and I had come twenty-four miles in the time—that at that I broke down, and cried like a child.

I learned later that the old woman took me for just the same person for whom the Bailiff at St. Albans had mistaken me, a young apprentice named Hunter, who had got into trouble about religion, and was at this time hiding up and down the country; Bishop Bonner having clapped his father into gaol until the son should come to hand. But her kind heart knew no distinction of creeds. She took me to her cottage as soon as night fell, and warmed, and dried, and fed me. She did not dare to keep me under her roof for longer than an hour or two, neither would I have stayed to endanger her. But she sent me out a new man, with a crust, moreover, in my pocket. A hundred times between Tottenham and Aldersgate I said "God bless her!" And I say so now.

So twice in one day, and that the gloomiest day of my life, I was succoured by a woman. I have never forgotten it. I have tried to keep it always in mind; remembering too a saying of my uncle's, "that there is nothing on earth so merciful as a good woman, or so pitiless as a bad one"

## Home.

A LITTLE room with scanty grace
Of drapery or ordered ease;
White dimity and well-scrubbed boards—
But there's a hum of laden bees
And sunshine in the quiet place,
And scent that honeysuckle hoards.

Outside, the little garden glows
With sun-warmed leaves and blossoms bright;
Beyond lie pasture, elm, and wood
Where trail the briony and wild rose,
Where grow the blossoms of delight
In an inviolate solitude.

Through that green land there blows an air
That cools my forehead even here
In this sad city's riotous roar;
And from that little room I hear
The echo of a life-long prayer,
And the world's voice is heard no more.

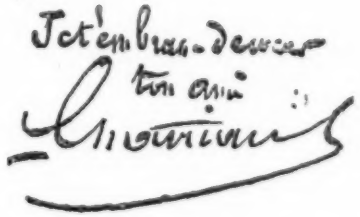
E. NESBIT

# ERCKMANN-CHATRIAN

## AND THEIR TALES FOR THE PEOPLE.

THE bookstalls round the Odéon are one of the characteristic sights of Paris. Here the genuine "People" are attracted like a swarm of bees, under the belief that those brilliant spots of yellow, red, and blue conceal abundant supplies of intellectual honey. How many books and pamphlets they turn over, sipping a drop here and a drop there! What appears ever a perennial and attractive flower, one from which no one ever turns away disgusted, or poisoned, or saddened, but which yields both fragrance and honey, refreshing and invigorating—what but Erckmann-Chatrian's popular delineations of the greatest period in French history, 1789–1815, the famous "Romans Nationaux."

The very name of these respectable authors has about it a flavour at once national and romantic. Its composite character recalls the two main elements which go to make the French people, and there is a mystery about the hyphen which gives free scope to the imagination. How seldom, however, does the imagination, until put on the right clue, guide us truly! How few would suppose that these writers, so well acquainted with the national life of their country and the workings of the human heart, shunned "Society," so called. When they lived in Paris, they were not to be found in the *salons*, literary or artistic, or on the Boulevards. When all the world was crowding there, they were sufficient company to themselves, and preferred to discuss their stories together in some obscure *estaminet* in the suburbs over a glass of beer and a pipe.



Could you have had a peep into that *estaminet* on the heights of the Faubourg St.-Denis, you would have seen two men as unlike in appearance as any pair could well be. One, Italian in aspect, with a great mane of hair, but otherwise not remarkable; the other a thorough Teuton, with a long oval face, high forehead, and very bald, dressed in the old Alsatian costume—plush breeches, coloured waistcoat, flowing coat with metal buttons, big shoes, and a great Alsatian felt hat. The first, Alexandre Chatrian, *ci-devant* glass-maker, schoolmaster, and finally railway *employé* and novelist; the second, Emile Erckmann, one time law-student, finally novelist, sawyer, and small landowner.

Such were the members of a literary partnership whose works are stamped with so striking an individuality that it is difficult indeed to imagine them the composite work of two persons, capable at

last of falling out and entering again into distinct existence. This forty years or so partnership commenced about 1848 at Phalsbourg in Alsace, the scene of so many of their stories; the good genius who brought them together being the professor of rhetoric at the Phalsbourg College, M. Perrot. They were both fugitives from the occupations in which their parents had placed them. Chatrian, then about twenty-two years of age, had not only learnt the ancestral art of glass-making (his family being one of those brought in the seventeenth century by Colbert from Italy into France for the purpose of nationalising that industry), but he had been sent to Belgium to perfect himself in the art. However, the longing for a literary career had seized him, and, throwing all up, he returned to Phalsbourg and supported himself by teaching. Erckmann, four years his senior, was a law-student at the Ecole du Droit in Paris, but working in it with so little heart that he took five years to pass his examinations. Meanwhile he had spent most of his time at the College of France and the Sorbonne, and had already published something.

This common desire for a literary career was the first link in their friendship; similar sentiments on various points in religion and philosophy, science, literature, and art, forming a chain sufficiently strong to bind them together during the greater part of their lives as one mind in two bodies. Certain domestic experiences had been similar—not only the antagonism each felt to the occupation for which their parents designed them, but both their families had suffered painfully in the invasion of 1814. Chatrian's mother, her infant in her arms, was watching her young husband being led away a prisoner, his hands tied behind his back, when a Uhlan dashing by struck his spear into her breast. In the same year, during the bombardment of Phalsbourg, Erckmann's elder sister was born. The terrors of the moment permanently affected her mind; for fifty-six years she lived in an imaginary world; then in 1870, the Germans coming again to Phalsbourg, the sound of the cannon awoke the memories of her birth-time, and she flew into the thick of the fight cursing "the bad soldiers who had come to burn her poor little town." Erckmann speedily arrived, and she died in his arms.

This life sorrow of Erckmann was in 1848 only in an early stage, but already a trouble severe enough to render the two young men sympathetic in their hatred to war and love to the country which had suffered so terribly from it, and in all probability would do so again.

Thus it was not only community of opinion, but an ardent sympathy for the People always suffering from somebody's selfishness and folly, and peculiarly for the People they knew best, that of Alsace. I use this word advisedly, because there are no authors who have more completely limited their sympathies to the People than Erckmann-Chatrian. Everybody who has read their works knows that they rarely pass beyond that great zone of life which

takes in the world's workers. "Society," about which the bulk of novelists write, has no place whatever in their works.

The great wars of the Empire have been Erckmann-Chatrian's theme, and, as far as I know, no writer except Tolstoï ever made military matters more interesting or rendered these murderous struggles more matters of living history. But where are the generals who usually absorb all the glory of such narratives? Even Napoleon is but an apparition, a great malign influence whom the folly of men has placed in such a position that he can play with human lives as a gambler with his fortune. But these ardent patriots—these rejoicers in anything that makes for the *true* glory of France—have no sympathy to spend on Napoleon as a man. To the joys and sorrows of those who by their ambition or circumstances get outside the great zone of life they remain absolutely unaffected.

On the other hand, you will meet no such heroes in their books as Oliver Twist or Jean Valjean. The pariahs of society, *les Misérables*, do not seem to have occupied their thoughts. They see that such was the condition of honest people before the Revolution of 1789, but they appear to entertain the belief that that great change put it into the power of every Frenchman to live a worthy, respectable life, and to reap a fair reward in exchange for a life of useful industry.

Their world is limited to the great middle class, understanding that word to apply to all who are not living on other people in some form or another. In depicting this world, in showing the stuff

> "Its life is made of, its true joys and griefs,
> What things are daily bringing grief or joy
> Unto the hearts of millions of the race,"

Erckmann-Chatrian have spent their lives, and the great popularity of their works is an answer to the fable that this sphere is dull and uninteresting.

The representatives of this great main stream of life—the People in the 1789 sense—Erckmann-Chatrian found in their own fatherland, Alsace; and in sketching their lives and revealing their innermost motives and feelings, they have centred their studies on the particular spots most connected with their own lives—Phalsbourg, the birthplace of Erckmann and the scene of their schoolboy days; the Vosges Mountains and Forests, the home of Chatrian; the valley of the Zinzell, where Erckmann now possesses, or lately possessed, a saw-yard and some fields and copses. Their love to their early home is as remarkable in its warmth, continuance, and effects, as that of Jules and Emile Breton, the painters, for the home of their nativity, and has broadened out in the case of Erckmann-Chatrian into a most intelligent patriotism, one of those purifying sources rendering their works such that the publishers[1] of "The Conscript of 1813" can honestly boast, speaking of Erckmann-Chatrian's "Romans Nationaux," that "not a word in these epics, at once so ingenuous and profound, will wound the conscience of the citizen or alarm the modesty of the fireside. Here," they say, "are books, here is a moral aliment that may be safely placed before the whole family; father, mother, children, grandparents, can read together, and, after having read, they will one and all feel the better and the stronger."

However, their work was slow enough in getting recognition, and it was only by aid of one *coup de main* after another that they even got them into print. The "Bourgmeistre en Bouteille" was published in "L'Artiste" as a translation from Erckmann by Chatrian, with a biographical notice of the author. "Dr. Mathéus," after having been multiplied into six copies, and hawked all over the country, was forced into publication in the *Revue de Paris* by a friendly director, and "Hugues le Loup" appeared in the *Constitutionnel* through the friendly plotting of a maker-up of pages on that newspaper. The last-named work ensured Erckmann-Chatrian a public, and henceforth there was no difficulty with their writings.

Heine has been called a French German, so Erckmann-Chatrian are rightly described as German Frenchmen. In their earlier works, the Germanic character of the country whence they sprang is very manifest, but, as they proceed, their style and matter become more and more thoroughly French. Their earlier tales are very simple in form, but at times extravagantly grotesque and even horrible, something of the character of those of Edgar Poe and of Hoffmann, besides being influenced by certain metaphysical notions, very interesting to students and suggestive to scientific inquirers, but which, if stated plainly, would as little obtain credence as the wonderful stories they relate with such apparent veracity. One such notion reappears very frequently, for example, both in the "Buried Treasure," in "Maître Daniel Rock," and in "Feudal Education," and even as late as in the "Invasion." It is the notion that the spirit of an old race reappears again and again in the neighbourhood of its first prowess and glory, finding its dwelling-place in some of its descendants, or, failing them, in those whose heart and soul are in the old times. In "Daniel Rock" you feel that the authors themselves believe this; but when you come to the "Invasion," though the idea has taken a still grander form, it has lost its reality, and has become something bordering on superstition and lunacy. However, in "Feudal Education," Erckmann-Chatrian seemed to have found a rational explanation of this atavism, or revival of the mediæval ancestor of an old family.

"Daniel Rock" is valuable because it enables us to see that these authors, who in their later and more important works show themselves the very personification of the genius of the Revolution, understood and sympathised with the spirit that looked lovingly and reverently to the past, feared and even detested the new ideas; shows, too, that before they wholly gave themselves to the defence of the Revolution, they had seen how easily in the hands of bad men it could work new evils. Nevertheless, they were in no doubt when they wrote this book, as the concluding words show.

In Erckmann-Chatrian's earlier stories, the moral purpose only appears here and there, and sometimes, as in the "Buried Treasure" and in "Dr. Mathéus," it can hardly be said to exist at all. In

[1] Preface to *Le Conscrit de* 1813. J. Hetzel et Cie., Paris.

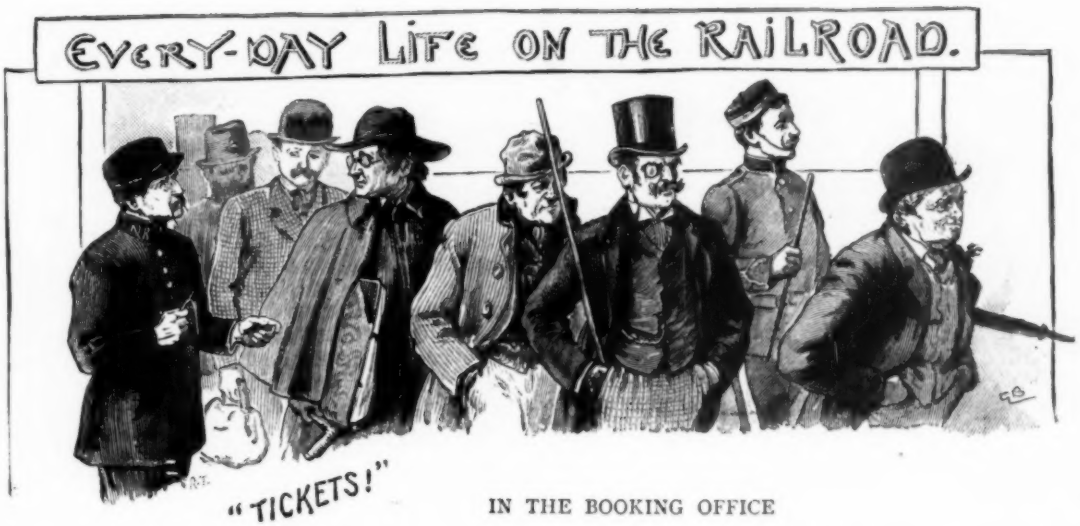
the "Contes des Bords du Rhin" even, where a distinct moral is inherent in the story, as in the "Juif Polonais," it leaves little impression owing to the nightmare character of the whole series. But the ethical side of their work seems gradually to have laid hold of them, and the belief that was in them from the beginning gained more and more strength, causing them to cast aside all that had its roots elsewhere, in order that they might live for the convictions it forced upon them, and for these alone. These convictions are most fully set forth in the "Histoire d'un Paysan," wherein they tell the story of the exodus of the French people from a servitude, not to one, but to a thousand Pharaohs, from the tyranny not of one strong despotism, but of several ill-assorted despotisms, followed by a struggle to maintain their liberty against the great powers in Europe. Erckmann-Chatrian wished that the French People should possess a history of these great events such as they should read and understand, and so written that they could not again be easily deceived by clever intrigues or by a military adventurer. "I," says Michel Bastien, the supposed author of the work, "am a man of the People, and I work for the People. I wish to say to them, 'If you are anything, if you are able to move freely to and fro, to work in your calling without worry, to set up for yourself, to rise in the army, in the civil service, or in any career you please, even to the highest ranks, you owe it to those who made the Revolution and struggled in its defence.'"

And knowing only too well that this great movement had for a whole century been subjected to innumerable dangers from the ambition of powerful men and the constant opposition of the various parties who lost their privileges in 1789, Erckmann-Chatrian laboured indefatigably to explain these things to their fellow-toilers, exposing above all the terrific perils and horrible disasters into which the two Empires led France. This, as regards Napoleon I., has been the object of three out of the four stories which comprise the "Romans Nationaux," the "Invasion," the "Conscrit de 1813," and "Waterloo;" and the "Plébiscite" and the "Blocus" do the same for Napoleon III. Nor have they forgotten the other influence against which the Revolution has had to struggle—the reaction led by the Jesuits. This reactionary influence in all its underhandedness, striving to drag the People back into the old darkness by getting possession of the schoolmaster, they have shown up in their story of the times of the Restoration called "Le Sous-Maître."

When Edgar Quinet was giving his famous courses of lectures, "Les Jésuites" and "Ultramontanisme," at the College of France, the one thing that most oppressed him was the thought that beyond those walls there was a dense mass of ignorance which no effort of his could penetrate, where his voice could by no manner of means be heard. Erckmann-Chatrian came to dissipate that ignorance, and to popularise the very ideas Quinet despaired of seeing understood by the rural populations.

If Erckmann-Chatrian's works are looked at in the light in which I have placed them, their limitations will be better understood and more fairly judged. The change described as taking place in them as to matter and style would naturally lead to their being less and less imaginative and more and more distinguished by common-sense. If any of the old mystical ideas crop up, then they are put into the mouth of some one whose reason is clearly overthrown by a disordered imagination. Thus every sane mind, however narrow or imperfectly educated, can, if it wishes, understand all they say. Thus, too, the characters introduced are simple, well-known, common types. There is, for example, always a love story gently threading the work, but it is of the simplest, most ordinary character. Indeed, it would seem part of Erckmann-Chatrian's plan to take the most unromantic of characters as representative of the mass of the people, and make him and the troubles of his heart the centre of a great national drama. It is an amazingly true idea, for such is life; each individual member of Humanity stands in this position to the history of his times. The most perfect example of this is to be found in the "Conscrit de 1813" and "Waterloo"; but Joseph Bertha is a type repeated in many of their works—the Erckmann-Chatrian hero, a young fellow, poor, ingenuous, timid, faithful as lover or friend, thoroughly honest and good-hearted. Their typical heroine, on the other hand, is a young girl with more force of character, more natural courage, sterner principles, more devotion to her country. Such is Marguerite Chauvel in the "Histoire d'un Paysan"; but the highest type of the character is a young woman who follows the Revolutionary army as a *cantinière* in 1792. Madame Thérèse is, in fact, the finest female character Erckmann-Chatrian have drawn, and is so perhaps because she is only a rendering of the highest type of French womanhood.

As all Erckmann-Chatrian's leading male characters, from the boy to the old man, are but varieties of the same type, so it is with the female characters. In each story there is some old woman who is Madame Thérèse, old, stern, more or less ignorant, more or less inclined to bigotry and superstition, more or less vindictive; and the acts of this old woman tend to be good or bad as she is under Republican or clerical influence. Such in the better sense is Catherine Lefèvre in the "Invasion." Such in the bad sense is Michel Bastien's mother in the "Histoire d'un Paysan." And this leads us to note that among all Erckmann-Chatrian's female types we cannot find the true house-mother in the English sense. The loving, tender-hearted parent, anxious, provident, is always the father or the uncle, or, failing these natural guardians, he appears as the good master. Indeed, the finest and most complete type in this way is the old watchmaker in the "Conscrit," to whom Joseph Bertha is apprenticed. As a rule, Erckmann-Chatrian's characters are "mitherless bairns"; only in one case is the mother fully drawn, and she is a bigoted termagant. On the other hand, Erckmann-Chatrian never give us an unkind father or uncle, except in the case of the Brothers Rantzau, whose selfishness, pride, and consequent enmity to each other, yield to nothing but their love for their children. Probably this affection between the men of different generations in a family has been their



own experience. Chatrian's first care, it is said, on becoming prosperous, was to secure more comfort to his old father, who, thus tenderly looked after, lived to a good old age. But I believe it is also a national characteristic.

These are the main characters on the Erckmann-Chatrian stage. Of others, distinctly drawn, we may mention Chauvel the Calvinist, the model Republican Deputy to the National Assembly in 1789; and the various types of French soldiers, from the swaggerer and bully to the man who, forced to fight, develops quite a genius for soldiering. Then all sorts of trade and artisan life are brought before us, especially as seen in Alsatian villages and small towns. All is touched off with humour, a humour which in its first outbreak was inclined to exuberance, but, gradually settling down, has become restrained, caustic irony, giving zest to the otherwise simple homeliness of the narrative.

Without doubt, the individual characters in Erckmann-Chatrian are a long way from being creations which touch the heart and remain impressed for ever on the memory, as those, for example, of Tolstoï. But if their flight is not high, it is strong and well-sustained. Besides, if they do not touch the deeper problems of existence, it is something to have devoted their lives to the task of teaching their fellow-countrymen the dignity of labour, the joy of a pure fireside, the glory of a life spent in fulfilling humble duties honestly and thoroughly well, the iniquity of sacrificing the good of a people to personal ambition, the folly of idolising men of genius, the horrible criminality of any war other than that forced upon a people in their own defence, and doing all this in such a manner that everybody is willing to listen, and no opening given for any one to find serious fault. Though their works are but of yesterday, Erckmann-Chatrian belong already to the past. This arises from the limitation of their views, the impossibility for them to go beyond the doctrine set forth in the "Rights of Man." But while the Revolution asserted the rights of the individual in the teeth of the whole world, it gave, as Erckmann-Chatrian themselves make us feel, a most powerful impetus to that common life which men experience as members of a nation or of the human race. Never has the idea of Nationality been such a power as in the present century. In its name events wellnigh miraculous, so little could human reason have expected them, have been accomplished. And still more the bond of brotherhood between men, as men, has become immeasurably stronger than ever was known in any previous age of the world. All this indicates that something more is wanted than the liberation of the individual, and the effort to evoke in him a sense of his dignity, his duty as a man. The nineteenth century has made us feel that men exist not only as individuals but as nations. And yet the science of morals moves so slowly that only very great thinkers have seen that it is just as necessary to evoke conscience in nations as in individuals. We see the result, at this moment, after a century of absolutely unexampled progress in civilisation: the so-called Christian nations look out on each other armed to the teeth, strengthening all their bolts and bars, and spending the greater part of their resources in forging new and frightful means for each other's destruction. Thus, while men as individuals everywhere and in all lands bewail this horrid state of things, and take each other lovingly to the heart, the respective nations to which they belong view each other as bandits, or even as wild beasts against whose predatory instincts it is necessary to be ever on the watch. There can be no way out of this but by awakening in each nation a conscience, and by appealing to it. This Erckmann-Chatrian's "Romans Nationaux" tend to do, though not so perfectly as might have been done had the authors had the thought as clearly in their minds as the writer of the Book of Exodus had. It does seem strange that, with such a wonderful history as that of Israel before us, we should find it so hard to understand that nations must remain savage heathens until they acknowledge the voice of Conscience compelling them to act as good individual men act, not by what seems for their immediate interest, but by their sense of Right and Wrong. And the existence of this Conscience and the necessity of evoking it Erckmann-Chatrian's books make us feel more clearly than ever.

Few lives are without their tragic side, and Erckmann-Chatrian's career is no exception. After more than forty years' friendship, their partnership, so fruitful of good, ended in a very sad manner. About two years ago the health of M. Chatrian began to decline, but in a way not easy to understand in its first stages. It proved in the sequel that form of mental ailment in which the sufferer believes himself persecuted, and it took the turn so often seen—the man most loved becoming the object of suspicion, opposition, and calumny. The saddest part was that neither they themselves nor their friends seem to have been aware of the true state of things until the estrangement became public. In this state of mind the sufferer talked and wrote against his old friend until a young man who was warmly attached to Chatrian wrote an article in the *Figaro*, which, among other things, charged Erckmann with a want of patriotism in living in Germany. This charge was probably the reason which induced M. Erckmann to bring an action for libel, as it certainly tended to destroy his credit with his countrymen. When the case came on in the Courts of Justice in Paris, it appeared that Erckmann lived in Alsace because the doctor said it was necessary for his health to live in the air in which he had passed his childhood, and in proof of his entire want of sympathy with the conquerors of Alsace it was stated that he had never learnt to speak their language. But what, of course, best cleared the whole matter up was the statement made by M. Chatrian's counsel concerning the state of his client's health. The Court gave M. Erckmann heavy damages against the *Figaro* and against the author of the article. M. Chatrian did not long survive the trial, dying on the 3rd of September last. Who does not sympathise with this tragic close of a friendship so unique and so prolific of good to others?

RICHARD HEATH.

IN THE BOOKING OFFICE

TAKE a sheet of pasteboard as large as Hyde Park, cut it up into slips an inch and a quarter wide and two and a quarter inches long, and you will have rather less than the number of railway tickets used in this island during the last twelvemonth. Put the slips end to end, and you will have a ribbon that will reach right round the world.

This is the jubilee year of the railway ticket. But we are so accustomed to consider the existing as the original that we require an effort to realise a pre-ticket period. It seems as remote from us as the days of barter from those of pounds, shillings, and pence.

A clerk will "book" 800 passengers an hour; in the days when he had really to book them, to write their names in a book, he would have thought the 800 a good day's work. The saving of labour has been enormous, and, unlike most inventions, the ticket remains much as it was at first. It is still numbered and dated, as it was then; and its only changes have been in colour and the words printed on it.

In 1839 an ingenious Friend who had failed in business had obtained a situation as booking-clerk on the Newcastle and Carlisle Railway. He had to book the passengers as the passengers were booked for the old mail-coaches—that is, to write out their names in full, fill in particulars of the date and station and class, and tear off the ticket from a printed sheet. It was a very natural arrangement, but cumbrous, and one day as he was walking in a certain Northumbrian field, and reached a certain spot in that field—the spot being known to this day—an idea occurred to him of quite another "spin down the ringing groove of change" to that to which he was accustomed.

"Why all this fumbling and spelling of people's names? Why not treat them anonymously and number them? Why not a strip of stiff paper, of pasteboard, printed with names of stations and class, consecutively numbered for accounting purposes, and dated on the day of issue to prevent fraud? Two machines could do it!"

And off went Thomas Edmondson to think it over with his friend Blaylock, the watchmaker; and together they made the first machines. But to get the new system introduced was not easy. The Newcastle and Carlisle directors would have nothing to do with it; they were content to leave well alone; and they left it, with a view of profiting by other people's experience. Edmondson had to look elsewhere, and soon secured two strings to his bow—a short one near home, and a longer one. The short one was a part of the Manchester and Leeds line, on which he was permitted to give his invention a trial; the longer one was in the West.

On Midsummer Day, 1840, there was opened what is now a portion of the Midland system, the line between Bromsgrove and Cheltenham. This was a part of the old Birmingham and Gloucester, famous among English railroads as having been the first to get its Bill through Parliament in the first year of application. At the outset it was a forlorn hope amongst railways. Its shareholders were obtained by months of canvassing, and great was the joy whenever a share was sold. The engineer was engaged on the curious terms of "no success, no pay!" and in order to keep down the expenses of opposition the line was taken well out of range of assault from the magnates of the towns on the road. It was this consideration which took it a mile and a half from Cheltenham and straight up Bromsgrove Lickey.

Bromsgrove Lickey is the steepest gradient on a main line in this island. It rises 1 in 37 for two miles; and yet, unlike all other steep inclines on the older roads, it has always been worked by locomotives. Brunel and George Stephenson said no locomotive could get up it; and in days when it was thought inevitable that there should be stationary engines to drag the trains up out of Euston and Liverpool, it was not a little startling to find an engineer stoutly declaring that up the Lickey he would send his train, and ropes he would have none. And up

he went; but even to-day so great is the effort that in ascending the gradient an extra engine has to come behind the train and push, while the front engine pulls its hardest; an arrangement which necessitates the keeping of five engines to do nothing but this "banking," at a cost of something like £1,000 a year apiece.

All the same, Brunel and Stephenson were correct within a certain limitation. By "no engine" they meant "no existing English engine." But Captain Moorsom had been in America, where he had seen engines go up even sharper gradients, and it was with American bogie engines, having driving wheels of only three feet, that he drew his first trains up the Lickey. These engines have long been superseded, the last of them used to be on the Tewkesbury branch—which was at first worked by horses—but they are worth remembrance. They were not the first bogies, for the bogie was invented on this side of the Atlantic, and there were bogie engines on the Dundee and Newtyle line as early as 1833.

Now an engineer who could work on the "no cure, no pay" system, who had enterprise enough to run a railroad up the Lickey, and pluck enough to put American engines on the line, was evidently the sort of man to welcome something new in booking. And so to him did Edmondson apply, with the result that a ticket-rack was set up at Bromsgrove and at all the other stations to Cheltenham by the old road which went to the east of Worcester. The terms for the use of the invention were half-a-sovereign per mile of road per year; and at these terms, other companies rushing in where the Manchester and Leeds, and Birmingham and Gloucester had not feared to tread, Thomas Edmondson soon grew rich. But an honest man was Edmondson as well as an ingenious one. As soon as he had the funds he called his old creditors together, and paid his debts in full, and then with a clear conscience he resigned himself to live on his royalties, find other uses for his money, and make many a pilgrimage to the spot of earth on which he had conceived his happy idea.

He had a brother, a distinguished schoolmaster, who, being also a railway-minded man, was progressive enough to introduce the study of Bradshaw into his academy's curriculum, and set his pupils to work out problems in cross-routes and connections. Both Edmondsons have been credited with having devised an arrangement which rocked the cradle and churned the butter at the same time, but we believe the honour is really Thomas's, who had invented many things before he dated his ticket and booked himself to fame.

On the Midland the little bits of pasteboard are made at Paisley and are supplied in boxes of 50,000 each. Most of them are in four plain colours for singles, first and third, and up and down; next come the four returns, each of two colours; and then comes a miscellaneous assortment of combinations of stripes and hoops for excursion work. How many varieties there are on the Great Western we know not; but many years ago, during Banbury Fair, the clerk giving an extra tug at a ticket which had stuck brought down the rack with a crash. Such a scene of beauty as the floor of the office then presented will not soon fade from the memory. In a confused heap lay firsts, seconds, thirds, parliamentaries, expresses, excursions, singles and returns, to probably every station on the system. To sort them was impossible with the crowd clamouring at the window, and the staff had to set to work to write the tickets from counterfoil books, and ever afterwards bless Thomas Edmondson.

As a rule, every station has a stock to last six months. The ticket rack is a case of tubes, each just large enough to allow the tickets to slip down it. In every tube is a column of tickets, differing from each other only in being consecutively numbered; at the lower end is an opening just large enough to permit a ticket to be drawn out. Tickets are usually numbered up to 9999 and then a new series begins, and the series letter or number is one of the printed marks. Between large stations a series is soon run through; but there have been tickets of such little use that even only five have been printed at a time.

Before the booking begins the numbers of all the bottom tickets are taken, and as each ticket is sold the next to it is drawn slightly forward. As the ticket is issued it is dated in the dating press to prevent fraud and to ensure its being used within a certain time. When the train has gone the projecting tickets show the tubes that have been worked; in each of these the number of the projecting ticket, less the number noted before the train was booked, gives the number sold, and in this way the "train book" is made up, and not only is the cash taken arrived at, but the amount and class of traffic to each station by each particular train.

Every day the totals of the train books are entered in the summary book, and this gives the day's takings, which either go to a larger station or are paid into the bank. Every month the starting and closing numbers of every tube of tickets are entered in a book, and a copy of this goes to the Audit Office. Everything has to balance, no matter how large the transactions may have been. And railway takings run into large sums, as we have seen. At Euston each booking clerk takes in the year over £50,000, and this by simply issuing these little bits of pasteboard through the office window.

Tickets are "examined" to keep passengers from going on the wrong road; they are "nipped" and "punched" to stop their being used twice; and they are "collected" at the journey's end as a check on the booking clerk and others who might lend themselves to a swindle. After collection, they are arranged in consecutive order and returned to the Audit Office. All through-tickets go to the Railway Clearing House. If a passenger takes a ticket, say, from London to Perth, the ticket comes back next day to London, and each of the companies over whose lines he has travelled is credited with the proper proportion of his fare. Such is the simple system of passenger booking, designed to give the minimum of trouble to the travelling public, and generally thought well of. There are, however, a few ignorant persons who strive to cripple it by travelling without tickets, or losing their tickets, or putting them to uses for

which they were not intended. But with the spread of education, and the increase of idiot asylums, such people become fewer; and every year there is a slight increase in the percentage of tickets returned from the collectors in good condition.

It is said that a collector can take 4,000 tickets an hour; but how many season-ticket holders is he able to recognise in the same time? In truth, there are a large number of "seasons" who are thoughtlessly unreasonable in this matter. "The moon looks on many brooks; the brook sees but one moon." The collector looks upon many ticket-holders; the ticket-holders see but one collector, and expect him to be as well acquainted with them as they are with him. What a task this recognition must be! There are ten companies having each more than 20,000 season-ticket holders. The North-Western has as many as 54,000, the South-Western nearly 40,000. Altogether there are a million and a quarter season-ticket holders in Great Britain, and to recognise these there are about 2,000 ticket-collectors! If we can in some slight degree mollify the anger of the hasty at being asked to show a ticket even every morning, we shall not have wasted space in pointing out that these figures average but one collector for each 625 faces!

On the North-Western the "seasons" return about an eighteenth of the passenger takings; on the Brighton, they yield almost a seventh, and the Brighton is doing its best to make the proportion even greater. Its first and second ordinary tickets return half a million a year, and its first and second seasons bring in nearly £180,000, or more than a third of the ordinaries. For three pounds one can travel first class for a week from any station to any station on the system. It is not a large line, having but a mileage of 435, but for £60 a passenger can travel for a year first class, all over it; and between London and Brighton, its chief termini, a first-class annual ticket costs but £30, or one shilling and tenpence a day.

Another great "season" line is the South-Western, distinguished above all lines for having for years issued third-class seasons to certain stations. Another is the Great Eastern. But these are much larger affairs, the one having twice the mileage and the other more, but on neither is the proportion of seasons to ordinaries so great as on the "model," whose gamboge engines are the trimmest south of the Thames. And, by the way, if these engines were not named after the stations, the advertisement of the line would be just as telling, and a fruitful source of confusion would be avoided. The other practice of painting up on the Brighton engines the name of the driver and the distance run is an admirable one, though the mileage looks small when compared, say, with the Great Western locomotives, one of which, the "Lord of the Isles," ran no less than 789,300 miles with the same boiler! The passenger engines of Great Britain run 152,000,000 miles a year, the goods engines run 125,000,000 miles. People who are astonished at the rows of figures in the Brighton "cabs" may perhaps realise the magnitude of railway work if they remember that the mileage of every engine on the Brighton line would have to be added together and multiplied by thirty to get within measurable distance of what the rest of the united companies accomplish in a year.

One more note before we leave this subject of passenger booking. Disregarding Ireland, as we have done throughout, for that island of struggle is still in the dark ages of railway story, a year's return shows that our season-ticket holders are as numerous as the whole population of New York; that the first-class passengers are twenty-three times as numerous; that the second-class passengers are more than double the first-class; and that the third class are nearly eight times as many as all the rest put together. Their number is easily remembrable; to the weak in democratic faith it is as the number of the beast, being, in millions, 666!

But enough of the passenger for awhile. Let us see how it is with the goods. The railway company after all is but a common carrier, and it is its goods traffic which will remain with it longest and which it does best. We have heard of railway travelling as inferior to walking, riding, coaching, and ballooning; we have not yet heard of its inferiority to any mode of land transport for goods. And it so happens that in no other country in the world is there anything approaching the efficiency of the goods service of Great Britain.

Think for a moment what a goods traffic means. Take no account of the minerals, which are generally in truck loads in large numbers and easily dealt with. Think of the miscellaneous consignments of all weights, shapes, and sizes which as a rule are received, packed, carried, and delivered with the regularity of the letter-post. Think of the distribution to hundreds of stations of single packages and packages by the score; of shirtings bought in Manchester at noon, and loaded in New Zealand liners before the following breakfast; of wool bought in London one day and sorted out in the Bradford mill at the beginning of business the next; of boots bought in Northampton one afternoon and on their way down Channel the day afterwards; of perishables—vegetables, meat, fish, butter, eggs—and general merchandise from Dundee, Glasgow, Newcastle, Grimsby, Holyhead, everywhere, bought or ordered one day and delivered hundreds of miles away before nine o'clock next morning.

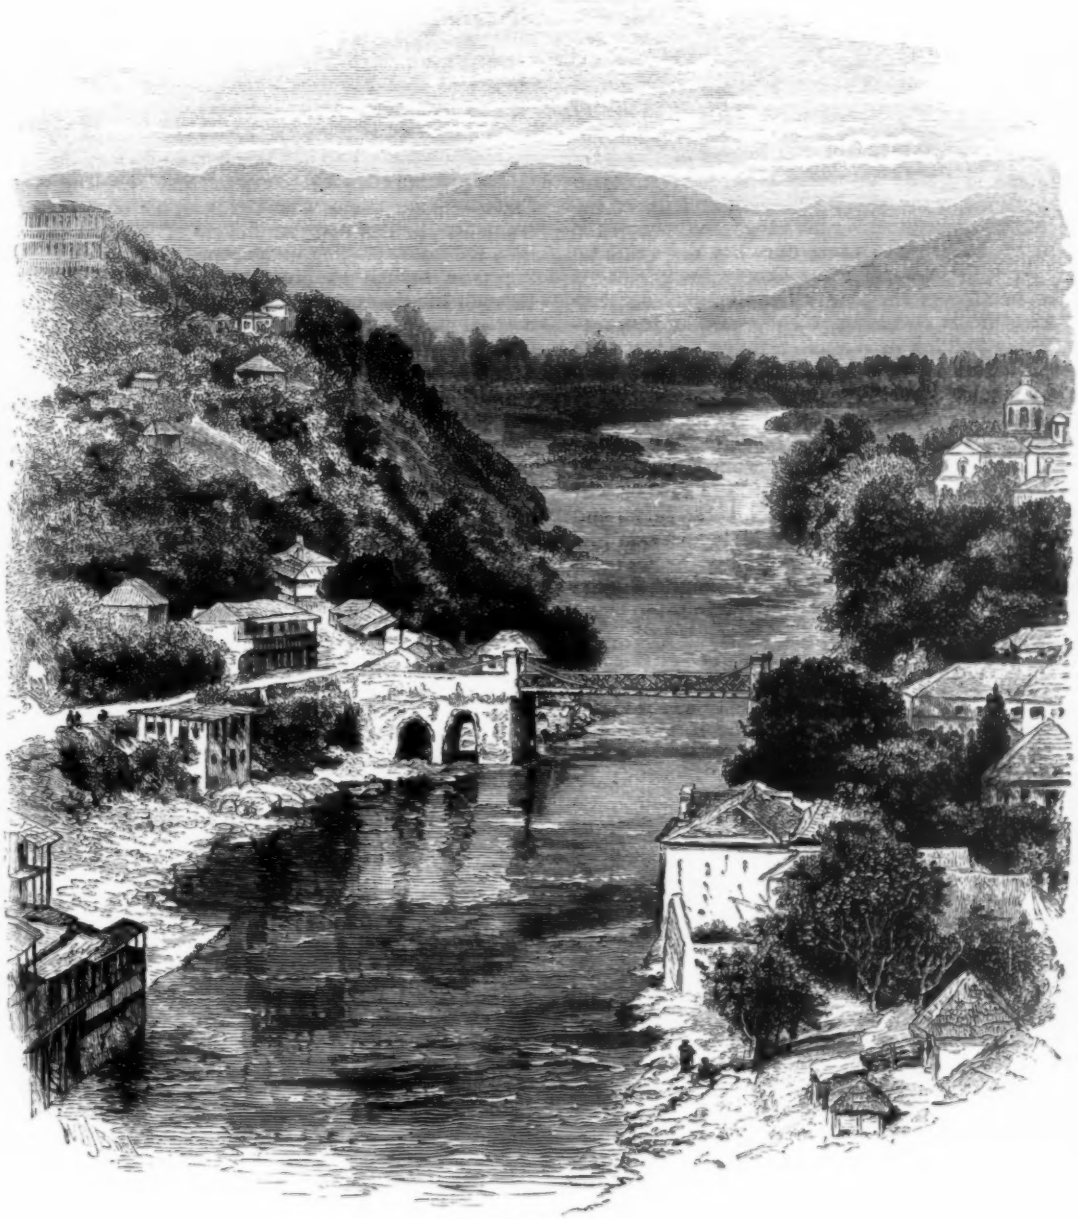
For its goods business in London alone, one railway, the North-Western, requires 640 horses, in addition to about the same number employed by its agents. Over three hundred of these are kept at Broad Street. In order to see how a goods station is worked, to Broad Street let us go. Here are seventeen acres furnished with lines affording room for 820 trucks, and the average trade is 456 loaded waggons inwards and 508 loaded waggons outwards per day. To load and unload these there are 54 hydraulic cranes and 129 manual cranes, besides the lifts and hydraulic capstans.

The theory of railway booking is for every passenger a ticket, for every parcel a consignment note. As the vans enter the gates they are stopped

and the consignment notes they bring are stamped. Were the notes not officially stamped at the outset, false notes might be substituted on the road, and the goods diverted into the wrong hands. Should there be a package without a note, one is made out for it; should a whole van-load have but one note, a separate note is made out for each consignment.

Along the front of the fourteen arches runs a platform to which the vans draw up. The notes are handed to the checkers who are in charge of the gangs of unloaders; and as the packages are removed they are checked with the note and weighed on the machines. Down every arch is a platform, on each side of which a train is being loaded for a particular district; each "run" is numbered, and the checker has the packages wheeled away to the proper arch. With it goes the note, which is taken possession of by another checker, and with it the package is run down close to the proper truck. When the package is on board the note is sent to the Shipping Office, where it is dealt out to an invoice clerk, who enters it on an invoice to the station to which it is addressed, and these invoices are handed to the guard in charge of the train. Every note is consecutively numbered, and the entry on the invoice has this number, so that the whole history of the package can be traced. The note is kept in the Shipping Office, the invoice is taken away by the guard and handed over at the unloading.

The waggons that have brought goods in the morning take goods back in the evening; up to noon the work is mostly inwards, after noon it is all outwards.



When the goods come in, the invoices are received at the Delivery Office, where they are copied, numbered, timed, checked as to rates and extensions, and marked with the position on the platform where they are to be placed. By means of letters and numbers on the columns that hold up the station roof London is mapped out into districts, and thus the marking clerk's task is facilitated. He passes on the invoice to other clerks, who enter up the van delivery sheets. From these the vans are loaded, and in this way the load of a single truck can be divided among twenty carmen, and packages from twenty trains can find their way into a single van. When the vans are ready the cartage department takes possession and horses them, and away they go with the delivery sheets to the group of streets they serve.

How quickly these incoming goods can be dealt with can be made clear from the story of one train. The Scotch "Meat" leaves Carlisle at 8.51 P.M., being ten minutes after the Scotch "Mail," and at this interval it pursues that train all the way to Willesden, where it runs off to Broad Street and begins to unload at a quarter to four in the morning. The Metropolitan Meat Market contains nearly 250 stalls, all of which receive meat from the railways, and it is the custom of the market that the railway companies not only deliver, but hang the meat and have it all in order before the arrival of the salesmen. Thus one of the waggons of our train may have thirty sides of Scotch beef for delivery to as many consignees in as many different parts of the market, while other meat may have arrived by other trains for the same consignees; and this all has to be sorted and gathered and despatched so that no two vans will be simultaneously delivering at any one of the Smithfield stalls. Here is a nice little problem in goods management, which is quietly solved every market, and that so quickly that no matter how early the salesman may arrive, the meat that was 300 miles away when he went to bed is hanging up round him ready for sale!

Out of Broad Street after 7.27 at night there is a goods train every quarter of an hour up to 11.20, the last one taking trucks for nineteen different places. No sooner is it out of the way than the trains begin to run in. As it is with Broad Street, so it is with the other London stations, and so in a less degree with the stations in the manufacturing towns. Broad Street is but an example; a similar state of affairs exists on the Midland, the Great Northern, the Great Western, the Great Eastern. All night long the goods trains are running at higher speeds than Continental expresses, and in the small hours of the morning they arrive, bringing a steady stream for the most part, but now and then an almost overpowering flood. The unexpected is generally perishable; it may be herrings from Peterhead or Yarmouth, or meat or fruit from Glasgow or Liverpool, or "578 tons of green peas from Maldon," or "68 truckloads of broccoli and 12 tons weight of narcissus" from Penzance. But, whatever it may be, the bulk of it has to be delivered before the clock strikes nine.

W. J. GORDON.

CROSSING THE MAMISSON.

KUTAIS.

TO arrive at Vladikavkaz is a welcome relief after the long and weary journey across the monotonous steppe from the valley of the Don. It is a relief, even though (as was our case) the afternoon of arrival is wet and gloomy, and nothing is seen of the mountains save a mist-shrouded outline of the wooded foot-hills. For the time soon comes when the clouds disperse and reveal the famous long line of snowy summits, stretching east and west as far as the eye can reach.

Vladikavkaz is a squalid and commonplace town. One can easily overstay its sights; even Murray records none. Its only "sight" is the fantastic beauty of the range of high peaks—*that* can never be wearisome. It is a sight that must affect even the people who live there. Perhaps it deepens their civic consciousness, or makes them long to turn their poor little town into a grand æsthetic capital.

Nothing out of the common can be done in

Russia unless you are furnished with a "document," pronounced "dokoo'ment." My document called upon all whom it might concern to supply me with all lawful requirements, as horses, guides, food. Armed with this paper and supplied with two days' provisions, I left Vladikavkaz *en route* for the Mamisson Pass.

At first we trotted over a sunny expanse of plain below the northern foot-hills. The hoary foreheads of Kazbek and his compeers stood out clear against the blue sky—a long row of gleaming summits, majestic in their enthroned strength. Lower we saw the shining glaciers, still lower the high sloping pasturages where the Ossete shepherds feed their flocks. During our first day's ride we fell in with many of these Ossete mountaineers. The number of them who live a purely contemplative life is enormous. They stare at you, presumably to drink in Western manners. They seem never to do a harder stroke of work than to stand in the sun and twiddle a piece of bark in their fingers. Life on such terms seems so easy that perhaps it would be unsafe to change it. Our first resting place was the Cossack village Ardonsk. To reach it we had to cross a multitude of little streams. It was so pleasant to rush our horses into them, and have our sun-parched faces and hands splashed with the cold drops. We got into the wake of home-driven cattle, and they crushed underfoot the wild thyme, and mint, and southernwood, and many another sweet-scented herb besides, and the delicate aroma came about us and dwelt with us all through that sun-lit evening. One remembers, and loves to recall, these little incidents of a first day's ride. I also remember how on that day the sun sank in a mellow glory of interfused colour, and I recall how mysterious the hoary mountains looked, with their lofty granite walls and cliffs of ice softened in the prevailing light of evening.

In Ardonsk I was sumptuously entertained by our Cossack host—tea and cakes, cheese and butter and cream—full, heaped-up hospitality. What a time we had after supper! I was the centre of interest to a number of half-tamed, stalwart fellows who sat around me, questioning me and being questioned in return. I cannot recollect by what gradations our conversation trenched on the land of dreams, on magic and ghosts. My entertainers had a rich repertory of wonderful, creepy stories. One brawny fellow in a red shirt possessed such elocutionary power, and such command of his eyes and other features at the horrible places, that he gave me cold shivers more than once. He *was* an artist, and I am sure he took delight in seeing me squirm under that terrible basilisk eye of his. One or two of their tales I took down just as they were told me—queer stories, reminding one of Scottish Highland legends.

"That great mountain there, Kazbek—you notice it out of this window. You can see it has a double peak. When the sun is bright on the mountain in May, and when the snow is purest, a gigantic dove, pure as the snow, comes and hovers over the slope between the peaks, and rests a wing on each summit. Whoever sees this dove we count worthy of heaven; as only those who are pure in heart, and whom God has called from the wicked ways of the world, can ever hope to see it."

"About twenty years ago, two hunters were hunting bears in the forests of the foot-hills. You cannot see the place from here; it is round the corner of that big brown rock. They came to an isolated rock, deep in the woods and thickly hidden with trees. In the face of the rock they noticed a cave. The day was hot, so they entered it, and casting their eyes around they saw behind them a square stone, which proved, on nearer examination, to be a door on hinges. A strong push sent the door creaking inwards, and, with a burning pine branch to give them light, they crept through the doorway. They found themselves in a spacious cavern, but to their amazement they found they were not alone. At a long table, covered with old-fashioned drinking-cups and vessels containing food, sat or reclined a great company of men, motionless and silent as the grave. The two hunters approached and saluted the company. They received no answer, nor was there sign that their salutation had been heard." Here the fellow in the red shirt (it was his story) fixed his eye on me. "They touched the man nearest to them. To their horror, he crumbled to powder beneath their touch. In terror, they returned to their village and told what they had seen. Their story spread, and a large party, among them the village apothecary and the clergyman, was formed to investigate the truth of the startling story. The cave was again reached and re-entered, and there were the silent revellers. Each when touched collapsed and fell to the ground, a handful of dust. The tables and chairs, the dishes and wine-cups, were of the same unsubstantial and pulverous character. The visitors were awe-struck: neither the science of the apothecary nor the divinity of the clergyman could fathom the mystery. Terrified and amazed, they returned home to tell the adventures to their neighbours."

These are both Ossete stories. Here is one by a Cossack: "When we had troubles many years ago with the mountaineers, we used to set sentries at the corners of the village. Once a young fellow called Ambrose Ivanitch was on sentry at the outpost looking along the mountain road. A fair-haired girl spoke to him, and offered him a rouble to buy her a cross to hang round her neck. Ambrose promised to purchase the cross, but instead of keeping his promise he took the first opportunity of spending the money on drink. A month elapsed and he was again on duty, when the girl approached him a second time, and offered him five roubles for the cross. Again he promised, and again he failed to perform what he had promised. When next he went on sentry the girl was there, waiting for him. Seizing him angrily by the arm, she wrote some characters in a strange language on the sleeve of his coat, and suddenly departed. The Cossack's conscience smote him. He remembered how he had deceived the poor girl, and went to the priest for consolation and advice, and to show him also the unknown letters on his arm.

These the priest succeeded in deciphering. They told how the writer was a lost soul in hell, who was permitted to visit the earth for a short hour once in each month, and that this or a greater boon would be extended to her and to others, provided she could persuade some one to buy her a cross; that she had given the Cossack a chance of doing this pious action, but instead of using the opportunity he had got drunk; that now she must go back into increased torments, but promised to return at some future time to give some other Cossack a chance of faithfully carrying out her behest; finally that eternal blessedness would reward him who might be the means of alleviating her terrible torments. So until this day the Cossacks on sentry at that station are always on the look-out for the fair-haired girl, and vow they will be truer to their trust and their religion than was their comrade of long ago."

Nothing could exceed the loveliness of the morning as we rode from Ardonsk over the plain towards the mountains. Before sunrise we saw how the highest peaks were first touched with the faint flushings of the dawn, then the lower mountains, lastly the foot-hills and the plain. The curtain of mist shrouding the mountains from our sight was raised, the majesty and terror of the frowning crags were manifested, the granite received its bright steel glint, and the porphyry its scarlet, the glacier and ice-cascade shone with their wonderful blues, and the high pastures sparkled like emeralds.

Alagir, a large village, half Russian and half Ossete, situated at the mouth of the deep glen through which runs the road across the mountains, was our next resting place. The country round Alagir was exceedingly beautiful, the hills of exquisite outline, and thickly covered with forest. Here we delayed for some hours until fresh horses were procured. After long haggling this matter was arranged, and we started for Klibs, the last village on the northern side of the pass. But before leaving Alagir I must not neglect to mention its silver-mines. Two of the best are in working order, one the property of the Government, the other owned by a Greek. The yearly output of the Government mine is from 1,100 to 1,400 pounds weight. Every third year the silver is sent under military escort to the mint at St. Petersburg.

Leaving Alagir, we passed through fine park-like scenery, with fair well-grown trees rising from plentiful grass. Flowers were in great abundance: meadows, rocks, and mountain-sides were covered with them. Among the trees I noticed thickets of honeysuckle, wild vines, clematis, yellow azaleas, and white rhododendrons, and crowding every crevice and cranny of the rocks ferns of all shapes and sizes. The scenery was never magnificent, but there was an indefinable charm about it. Everything was vividly green, but the brilliant verdure of grass and tree was merged in the deep Tuscan blue of the hills, and streaked with faint grey wreaths of smoke from charcoal-burners in the hazy hollows.

Almost all day long our road was bordered by these great generous trees, and as we gradually ascended, their verdurous vistas led us on to pine forests. In the light of the setting sun that even ing, the yellow-knotted branches of these pines blazed scarlet, and the granite rocks overhead seemed to lose some of their sternness and to become more fantastic than ever in form, and incomparably richer in colour. And between each cluster of rocks we had glimpses of fair meadows with their shepherded flocks, and of clear rivulets murmuring between their crevices among the flowers.

We arrived at Klibs late at night. The village was perched high up on an overhanging rock. Faintly outlined against the stars were the black lines of the squat Ossete houses and the flanking trapezoid towers which are so common a feature in all Caucasian villages. Everything was as silent as the tomb until our guide yelling our arrival wakened every dog in the village. The barking of the dogs wakened the villagers, and there soon followed a moving of lights and a murmur of sleepy voices. From high up the rock an answer at length came. A long and animated conversation followed, carried on at the top of their voices, between the guide and the villagers. It was explained who and what I was, and that I desired shelter for the night. Before long, two huge and hirsute Ossetes appeared at my side, and told me that I might climb up to their house. They assisted in tethering the horses and in carrying the baggage. It was a nasty scramble up the face of the rock. In the dark I knocked my shins and arms and head against the projecting obstacles in my path, and I fear I used language stronger perhaps than was necessary in depreciation of the Ossetes and their wretched village of Klibs. At the top of the rock we were met and welcomed by our host, the headman of the village, and given shelter for the night. I do not wish to say a disparaging word of our host's hospitable intentions. I am sure he did his best. But his wretched stone hovel contained not one single article of comfort. Its three rooms were small, dark, and malodorous, and swarmed with noxious vermin of all sorts that clung to us for days afterwards. My bed was a rough greasy board and a foul sheepskin. What with the active vermin and the extreme cold, sleep was out of the question, so I beguiled the night with inquiries into the internal management of Ossete village communities, and points of Ossete law. They are not subjects of thrilling interest, but as our host was a great authority on such matters, I took careful memoranda of all he had to tell me. Reading over these notes now, I find them neither interesting nor novel, and unsuitable for a sketch like this.

As everything connected with our lodging at Klibs conduced to early rising, we found no difficulty in being in the saddle before daybreak. After an hour's ride we were in the snows, following a narrow and ill-defined track of horses' feet. We were rapidly ascending. On a hard platform of snow we rested for breakfast. The view was superb. The snowy crests were flushing in the low rays of morning; behind us great black jagged rocks rose grandly from the snow. Higher up, the

range of cliffs looked desolate and threatening. Icicles over 100 feet long were hanging from them, and masses of blue ice jutted over their edges and frowned down on us. The highest peaks were almost free of clouds, only a wreath or two of light vapour haunting them, ready to flee as the sun rose higher. We had much difficulty in getting the horses up what remained of the climb. They plunged and floundered about in the snow helplessly. When the top of the pass was finally reached, and I looked down at what we had accomplished, I was amazed that the horses had been able to climb so steep and slippery an ascent. Only Ossete horses could have done it. At the summit we had another rest, then a pleasant walk across a snow saddle brought us to the edge of the southern declivity. Here we noticed the military survey board and an announcement on it that this point was 9,400 feet above the level of the sea.

When about to begin the descent the guide informed me that I might make a considerable short cut by skirting under a snow cliff to the left, and join him and the horses further down. As the "short cut" looked formidable and uninviting, I naturally inquired whether in the guide's opinion the snow was hard enough to bear my weight. As he assured me there was no danger, I turned under the snow cliff which rose on my right to a height of about 60 feet, and which hung in places at such an angle over the ledge on which I walked that I was obliged to crawl under it on my hands and knees. To the left a broken snow slope led down to the platform where we had breakfasted, 1,500 feet below. All went fairly well until I missed my footing and stumbled against the cliff. In this way I dislodged a quantity of snow from overhead, and the impact of this on my head and shoulders caused me to lose my balance, and sent me sprawling and sliding down the slope. After a slide of 250 feet I checked my descent by impinging against a friendly rock that stuck up through the snow. I was a good deal shaken and astonished. I called to the guide for assistance, but the rocks between us prevented him seeing my plight, and I had to console myself with copious expressions of his sympathy. So I picked myself up, and after an hour's painful climbing I managed to reach the place where the guide was waiting with the horses. I had had enough of short cuts.

The descent was quickly made, and we experienced no difficulty in reaching the lower ground. Myriads of snowdrops and ranunculus, of blue gentians and anemones and blue-bells, studded the emerald turf that clothed the mountain-sides below the snow. Innumerable springs and streams clear as crystal, either trickling in filtering threads through the rich grass, or tumbling down over the rocks from their reservoirs among the mountains, gathered themselves together into the head waters of the Rion. A two hours' ride along a wonderful zigzag road cut in the face of the mountain brought us to the picturesque village of Grushavi.

Further on we entered a magnificent pine forest—not the twisted and knotted trees of the northern side, but majestic self-contained pillars fit for "the mast of some great ammiral." They stood by the roadside and by the river's edge, and clothed the mountains until their way was stayed by the great Caucasian cliffs far overhead. Every perilous ledge where footing could be won held serried companies of these spectral trees. They were so close together that the sun could not reach their bases. Their gloom was all their own: a solemn twilight that brooded over their stately aisles and stole along their gloomy columns to lose itself in the illuminated interlacings of their fretted roof. Towards afternoon we came to a green carpeted glade

> "whereon the wild thyme blows,
> Where oxlips and the nodding violet grows;"

and in the grass mountain strawberries and forget-me-nots and fresh young ferns. Here under a sheltering tree we kindled our fire and made our soup. We heard the rustle of the Rion away below us in the warm hazy valley, and the song of thrushes in the trees around; fragrance in the air, the drowsy hum of insects, and the occasional fall of the pine needles.

Our journey to Oni was continued through the widening valley of the Rion. Numerous contributions from the lateral valleys went to swell the river into a fine mountain stream. The pines receded higher up the mountains, and were replaced by beeches, elms, chestnuts, and a rich undergrowth of hazel, laurel, and holly. And so along the river-bank through the rich valley.

Oni is the chief town of a Georgian province called Radsha. It is a small place of about 4,000 inhabitants, composed of Georgians and Jews. High wooded hills, vineyards, and cornfields surround the town, and give an air of comfort and plenty to the whole country-side. Our road led through the Jewish town, and almost instantly a score of boys left their play in the street and formed a tail behind us. Then we rode into the Georgian town, and here the Georgian boys joined their Hebrew companions. An occasional elder was picked up on the way, and two priests likewise joined the growing procession. From place to place, as we went in search of suitable lodgings, this solemn-mannered crowd followed us; and when at length we were comfortably established in a decent room, they sat on the road before our door, and patiently waited for our casual appearances.

Next day was Saturday, and I used the favourable opportunity to visit the synagogue, a quaint old building, held in high reverence by the Jews in the neighbourhood. It seems there are 120 Jewish families in Oni, and scattered over various towns and villages in the Central Caucasus some 600 families more. To all intents and purposes, these Jews are mountaineers. In dress, manners, and speech they are not to be distinguished from the Radshian or other Georgian hillsmen. But their Semitic physiognomy is undeniable. They are strict Jews, observing most of the severer enactments of their law. They are traders and craftsmen, never agriculturists, and by close attention to their business they have become the propertied class in Oni. Their thrift, industry, and sobriety might be imitated with advantage by their improvident Georgian neighbours. All my inquiries into

their early history and traditions proved fruitless. The polite but ignorant Rabbi could tell me nothing, he had neither archives nor documents, ancient or modern. One old man ventured an opinion, which he said was shared in by all his people, that they came to the Caucasus soon after the destruction of Jerusalem. Before I left Oni, a deputation of these Jews, headed by the Rabbi, called upon me to complain of the manner in which they were treated by their Georgian fellow-townsmen. The list of their grievances was long, and revealed a sad state of affairs. One poor fellow had had four bullocks killed during the night by some Georgians, in sheer drunken wantonness. He knew the perpetrators of the outrage, but was afraid to inform the police lest worse should befall him.

From Oni to Kutais we passed through one long succession of romantic scenes set in pleasant and rich surroundings. The southern slopes of the hills were crowded with vines. These picturesque plants came trailing and streaming over into the road, they lay on rocks, they bound down the roofs of houses, in their wild or semi-relapsed state, they climbed over trees and hedges, and hung in thick masses with ivy and clematis. At Tchishe we had an hour's delay. Opposite our halting-place was a little Georgian school, and as I had nothing to do I thought I would pass the time agreeably by visiting it. The master saw me coming. I heard him warn the scholars (there were about twenty, including one little girl) to rise at my entrance. This they accomplished with a mechanical exactitude that left nothing to be desired. The branches taught were few and elementary. The simple rules of arithmetic, reading and writing Georgian, Scripture history, and Russian. The latter is the only subject which is compulsory, and no Georgian teacher, no matter how well qualified he may be otherwise, can obtain even the most insignificant appointment unless he has passed a satisfactory examination in this language. I was glad to learn that in autumn lessons in vinoculture are given to the boys.

Beyond Tchishe the country became more thickly wooded. Vines grew on all the warm slopes. Myriads of wild roses in full bloom decked the mountain sides. Twenty-five miles from Kutais we entered a magnificent gorge with sides so precipitous, so overhanging in places, that they seemed to close over the road. The rocks were clothed with vegetation, from the silver and orange stains of lichen and moss to magnificent groups of majestic pines. Long trailing creepers hung from rock to rock and from tree to tree, and in moist places where springs dripped from the cliffs the delicate maiden-hair and the long cool fronds of hartstongue shrank from the heat of midday. "What are lithographers' stones worth in England?" an enterprising postmaster asked me at a station near Kutais. I did not know, but I thought good stones were expensive. "Well, there are thousands of tons of them in that mountain opposite." We were gradually approaching Kutais. Pleasant little cottages lay low among shapely walnut and chestnut trees. Picturesquely-clad Imeritians reclined beside cool streams, rich crops of corn grew in the fields, the fruit-trees and vines gave splendid promise. It was a land of plenty, with the aspect of having been long lived in and enjoyed.

At length the rattling of our cart over the paved streets of Kutais warned me that I had returned to civilisation, and that my mountaineering, such as it had been, was ended. I looked back with longing to the high snow plateaux of the Mamisson, and the magnificent pine forests below Grushavi; nevertheless, I felt glad that I should sleep in a bed that night, and that in Kutais there was something to eat more satisfactory than hard bread soaked in weak tea.

MICHAEL A. MORRISON.

## The Lost Bird

ONCE upon a time, I've heard,
On a lovely summer's day,
From its nest a little bird
Twittered, fluttered, flew away.
Up into the air it flew,
Singing, singing, as it rose;
Where it went to no one knew,
How it vanished no one knows.

Pines the mother in her nest,
Sits there pining night and day,
No joy in her gentle breast
Since the birdling flew away.
Neighbour birds their comfort bring
(Sympathy to birds belongs),
Try to cheer her when they sing,
Sing her comfort in their songs.

Sings the blackbird from the thorn:
"Perhaps your pretty birdling's strayed
All among the summer corn,
And a happier nest has made?"
Sings the robin from the sloe,
In a gentle, tuneful strain:
"As the little birdlings go,
So perhaps they come again."

Sings the thrush from silver birch,
In its sweetest voice of song:
"Neighbour, use thy wings and search
Ripest orchard fruits among!"
Sings the lark from field of oats:
"When I fly into the air,
From heaven a sound of music floats,
Perhaps the little birdling's there!"

JOHNSON BARKER.

# THE INCOMPLETE ADVENTURER.

BY TIGHE HOPKINS, AUTHOR OF "THE NUGENTS OF CARRICONNA," ETC.

GUY EXPLAINS TO DR. RAE.

## CHAPTER IV.—THE DOCTOR IS ABSURDLY SCEPTICAL.

PASSENGERS by the express to Calais, two evenings later, were amused at and rather curious about a long-legged fellow-traveller, with his arm in a sling, who descended from the train wherever it stopped, and paced the platform like a madman.

Not less eccentric was his conduct on the steamer, where, finding pedestrianism difficult on the deck, and a recumbent attitude impossible below, he finally seated himself at the top of the saloon stairs, and there remained uneasily, but with undiminished spirits. He wore the air of a man who had suddenly become possessed of the only secret worth holding in the world. Withal, he was very shabby, and looked hungry, but called for nothing except a glass of water, in which he scattered some grains of a black powder. It is perhaps not necessary to name this traveller.

All the way from Paris to London, Guy was in the throes of his project. He had first to raise £500 for the purchase of the secret. He could not, it is true, name offhand the capitalist whom he should ask to be his creditor for the amount; but what of that? With such an affair in hand, the preliminary £500 would find itself. At least, this was the faith that was in Guy. He was lost in dreams of the millions which those few hundreds were to make for him.

From Dover to London Guy slept through sheer tiredness of brain; but he awoke at Victoria as fresh as lean living and a consuming idea could make him. Children and athletes in training and persons with schemes are the only people with whom the zest of life begins at the moment of awaking.

The train-load of hungry, half-awake, and dishevelled passengers streamed out on to the platform, tightening their wraps about their shoulders, for the morning air was a little keen. Guy shouldered his way amongst them, dragging a battered portmanteau after him.

"Cab, sir?"

"H'm! I'm bound to do something with this thing," said Guy, with reference to the portmanteau. "Can't drag it after me to Waterloo. Can I stand a cab? No; I might send it home for the price of a cab, and be rid of it."

Acting promptly on this idea, his next problem was breakfast. Several of his fellow-voyagers were making their way to the refreshment-room.

"A coffee-stall is about my mark, I expect," observed the would-be exploiter of millions, and he found one at the corner of Buckingham Palace Road, where an expenditure of threepence and a pinch or two of the powder provided him with a slightly better meal than he had lately been in the habit of commencing the day with.

"There's a smack of the coffee of Arabia about it; Armand himself might have brewed it," thought Guy, as he felt for his pocket-handkerchief, and remembered that he did not at present carry such a thing.

The streets were cool, and fresh, and quiet; and the sun delicious.

"Now, I'll walk to Waterloo, and take the first train home," said Guy.

The streets grew more familiar as he stalked along with a leisurely swinging stride. He stood

to admire the Abbey, and went a few steps out of his way to pause in the centre of Westminster Bridge and delight himself with the picture which inspired Wordsworth with his finest sonnet. He was turning on to the Embankment when the name on a small brass plate—amid several similar plates—on the door of a huge red building arrested his attention.

"Dr. Phipson Rae."

"Well now, that's odd! Can this be Phippy? Yes; it must be Phippy himself. There can't be two Phipson Raes, and Phippy was walking the hospitals the last time I heard of him."

Guy retreated a step or two and took a survey of the building. It was an imposing concern, and its inhabitants were evidently not early risers, for no blind was raised.

"Why, Phippy is the very man for me!" exclaimed Guy. "Curious now, that I should never have thought of Phippy before. His father is wealthy to an almost indecent extent, and Phippy might make his own fortune by carrying the powder round amongst his patients. Certainly no doctor should be without it, and it ought to be the very making of a young performer like Phippy. I think—yes, I will—I'll let him know about it at once. He will learn to bless this day. I'm afraid he's not up yet; but, on the whole, I believe it would be a kindness to rouse him."

And, without another thought, Guy advanced to the door, with the intention of ringing his friend's particular bell. Then he saw the end of a speaking-tube protruding from beneath the brass plate, and the words "Night Tube" engraved above it.

"Ah! This is the thing;" and stooping, he applied his mouth to the tube, and blew into it. There was no response, and Guy whistled into the tube again. Then a muffled voice issued from the mouth-piece.

"Yes; what is it?"

"If it shouldn't be Phippy," muttered Guy. "Nonsense! It must be he. Here goes for him."

And he shouted through the tube.

"Is it you, Phippy?"

"Of course it is," responded the muffled voice. "Are you a chum of mine? What do you want?"

"I want to make your fortune!"

There was no answer to this.

"It was a little too sudden," said Guy. "Look here, Phippy," he called again, "this is an entirely serious affair; it is the most serious thing you were ever in. There are millions in it! Get up and let me in at once."

"Who on earth are you?" queried the voice, dully, all inflection being lost in its passage through the tube.

Then it flashed upon Guy that he had not introduced himself.

"It's Warwick," he shouted, "Guy Warwick. Remember — oh! what? — remember everything. Get up and let me in. You'll never have another chance like this in your lifetime."

Then a window was opened on the second floor, and a clean-shaven and rather stout face showed beneath the uplifted sash.

"*Hwhat*! Is it yourself? Stand out there till I look at you! 'Tis you indeed!"

This address was delivered in delicate Hibernian, and the window-sash descended with a clap.

"It is certainly Phippy," said Guy. "If his father is still alive, the company is as good as launched."

The street-door was violently opened, and a short, stout, and broad-faced young man, who wore a silk-lined dressing-gown over his night-shirt, held it wide for Guy.

"Isn't this great?" said the doctor, every feature of his face expanding. "Come in now! Don't shout, for I've only my own rooms here, and the rest of the house won't awake these two hours. Are you from Paris, or Potsdam, or where? You've your arm in a sling, and I didn't hear tell of you these three years!"

"My dear Phippy," said Guy, "this is the most extraordinary meeting. I dine in Paris, I breakfast in Buckingham Palace Road, and on my way home—with the most prodigious scheme at my fingers' ends—I light upon the man who best deserves the fortune I can make for him."

"Oh! 'tis you indeed, not a doubt of it!" laughed the doctor, as he went before Guy up the stone steps to a landing which conducted to a spacious and handsome suite of rooms on the second floor of the building.

"My dear Phippy," said Guy, as he surveyed the comfortable and elegant chamber his friend had led him into, "is it possible that I have made a mistake? I cannot associate you with a room like this. I am thinking of the den in Greek Street, where we spent our last night in London together.'

"Be easy now," answered the doctor. "Sure I remember Greek Street as well as you do. But I'm out of it this four years, and 'tis as much as me practice is worth to throw the eye of me mind back upon the beautiful times we had there."

"I also have changed, Phippy."

"Didn't I know you would! But tell me now, what is it has brought you back this way, Guy? and how is it you've your arm in a sling?"

"The sling explains it all," said Guy. "If my arm were not in a sling, I should still be in Paris, and powerless to advance you, Phippy."

"'Tis mighty keen you are about advancing me, my boy. But what are you going to do for yourself? What's this scheme you have at your fingers' ends?"

"First tell me," said Guy, "what sort of practice you are engaged in."

"I will, to be sure. I'm at present one of the likeliest ophthalmic surgeons in London. I'm rising daily, me boy."

"I'm very sorry to hear it," said Guy, gravely.

"That's a nice way you have of complimenting me!"

"No, no! don't misunderstand me, Phippy. Of course, I am delighted to see you in such flourishing circumstances. Only, as an ophthalmic surgeon, I cannot do anything for you."

"Sure, me dear child——"

"My dear Phippy," broke in Guy, "what I want is a rising general practitioner."

"You'll get the likes of those in plenty," laughed

Rae. "And what ails you that you want a general practitioner?"

"Phippy," said Guy, "the accident of this sword-wound in my arm has led me to the discovery of a marvellous curative agent, which is not, strictly speaking, a medicine, nor, in the literal sense of the word, a food, but which is, in fact, the most incomparable medicine and food together in the whole world."

"That's a great find indeed!" said the doctor, but his tone did not impress Guy as sufficiently serious.

"Listen," said he. "You do not realise the significance of what I am saying to you, Phipson."

Then he began to detail in his grandest and most persuasive style, with flourish and with gesture, all that had befallen him in Paris since the morning of his accident.

During this recital the countenance of Dr. Phipson Rae fell steadily, and his air grew more and more professional.

Guy, however, did not observe, or declined to observe, this gradual change in him.

"Ye see, me boy," began the doctor when Guy had finished, "these patent medicines——"

Guy sprang from his chair and confronted his friend, astonished indignation in his eyes.

"Easy now, easy now!" put in the little doctor. "Don't be glaring at me that way! Maybe I didn't grasp your meaning fairly. Sit down, *avic*, and give me the points of it again," and the doctor composed his plump features with an increasing difficulty in controlling the muscles of his mouth.

"Have ye any of the—have ye any of it about you? Would it spoil a person's appetite for breakfast? Is that it? Spread it out here before me till I look at it. I never saw the likes of it before. Swallow down a pinch of it, honey, till I see what effect it has on ye."

"Not at all, blockhead!" exclaimed Guy. "Have I not been telling you all along that there is nothing magical about it? But look here, Phipson, I will tell you how you shall prove one amongst its innumerable virtues. If you will promise me to let no ordinary food pass your lips this day, I will leave you a sufficient quantity of the powder to sustain you in comfort for twenty-four hours."

"You couldn't speak fairer, me boy, I declare you couldn't. And I'd be very willing to give it a test that way, but I've an aunt that's coming up from the country this afternoon; and, ye see, she's lonesome in town, and what did I do but offer to take her to dinner somewhere to-night?"

"Phippy," said Guy, "I see what it is; you're simply trying to humour me. You do not believe in it. This is not worthy of you; it is not worthy of your calling."

"See now, *avic*," said Phipson, soothingly, but still with a twinkling eye, "don't be getting angry with me. Sure, who'd be better pleased than I would to see a fortune for you in one of your projects? But don't I remember them all, *inagh!* and how many of them there were in the times beyant? D'ye mind now what an elegant scheme you had one time for using windmills on wheels in the place of houses—sails up, and just to go wheeling and sailing about the country, and a change of scene every day. And there was another——"

But Guy's patience was exhausted.

"Phipson," he said, "I am sorry that I disturbed your rest. Go to bed again. You need a little more sleep. This matter is one that requires to be discussed with an unclouded brain. Perhaps you will hear from me again; perhaps you will not. Meanwhile, I am disappointed in you, Phipson."

The doctor's whistle sounded. It was a timely interruption. Their parting was brief, and more cordial on Phipson's side than on Guy's.

## CHAPTER V.—"THE NEW MACHINE, AND IT BECAME A ——"

"THERE'S an hour wasted!" said Guy, as he tramped along the Embankment to Waterloo.

"No," he added almost in the same breath, "an experience gained is not time wasted. When you have an affair in hand, never share it with an old friend. That's a hard conclusion, but a sound one. It would have been better to let Phippy sleep."

He pelted along; full speed was his habitual pace. But he inhaled, without knowing it, the fresh beauty of the morning; the sheen of the river, the glint of the little leaves of the sapling trees along the pavement, the smell of the grass which the gardeners were cutting in the gardens behind the ugly palings, the bustle of the wharves on the other side, where barges were unlading—all these sights and sounds and odours, familiar at once and strange to him, exercised an unconscious and stimulating influence upon his senses. Arrived at Waterloo, he was as buoyant as ever, and outside the ticket-office he counted the coppers in his pocket.

"Give me a third-class ticket as near to Deershott as sevenpence will take me."

"Lost your purse, sir?" queried the clerk.

"Not at all," said Guy; "I have sevenpence in it."

The clerk consulted his tariff, and handed him a ticket for a station about eight miles nearer town than Deershott.

Guy emptied his pocket, took the ticket, passed the barrier, and bowed to the porter who opened a first-class carriage for him.

He got down at the station marked on his ticket, inquired his way, and struck into the high-road.

Within three miles of home the foot-path ascended into a steep gorse-clad bank, from the summit of which the white and dusty road was barely visible. How seldom it is in these days that adventures are to the adventurous! But the man of romantic spirit is an adventurer at heart, whether he knows it or not; and, even now, he it is whom the chance befalls. Guy—big and lean and handsome, and barely decent in his clothing—was pounding along the gorse-lipped path with less thought of woman in him than Hamlet had.

A petulant small scream arose from the roadway. He stopped and peered down through the gorse.

It was a girl upon a tricycle. No one has

imagined the possibilities of romance to which a tricycle lends itself when the lady who rides it has forgotten her dress-guard, and is arrested on the high-road with her skirts entangled in the chain.

From the vantage of the two-foot path above the road, Guy had a vision of a slim and pretty girl, with copper-tinted hair under a broad hat with white ribbons, in a position of unstable equilibrium on a light machine topping an awkward hill. He broke through the gorse, and jumped into the road beside her.

### CHAPTER VI.—GUY SPOILS A LADY'S SKIRT AND ROUSES HER INTEREST.

IT was the first time Guy had seen a lady on a tricycle, and as there did not appear to be anything whatever the matter, either with the lady or with the tricycle, he was rather at a loss what to make of the situation.

"Oh! thank you, so much," said the lady; "it's very kind of you indeed."

She could have said this only on the supposition that Guy was about to extricate her from her difficulty; but this was the very thing that thwarted Guy, inasmuch as he had not the smallest idea what the difficulty was; and he had, in fact, simply taken off his shabby round hat, and asked her where she was hurt. But Guy put a question of that sort with a manner of authority at once so indisputable and so gallant that it was impossible not to believe that he was the one person in the world to deal with such a situation.

"Thank you, I'm not hurt at all," said the lady, prettily twisting on the narrow saddle of the machine. "But you see how it is, don't you? I stupidly left my dress-guard at home."

"Y-yes," said Guy, who seemed to be bursting with a knowledge he did not possess, and who would not have been one whit more in the dark had the beautiful stranger said that she had left at home her goloshes or her prayer-book; "your dress-guard—yes; how did you come to do that?"

"Really, I don't know," answered the lady, "except that I came out in such a hurry. I can't explain that to you, but I felt as if I must ride at that moment or perish; and, of course, when you feel like that, you don't always remember things, do you?"

"Impossible," said Guy. "But the dress-guard?"

"Yes, I ought to have remembered that, of course; and now I'm afraid you'll have to cut me out!"

Guy thrust his left hand into his pocket (Armand had mended the hole in it) and glared fiercely at the tricycle. The mechanism of an ostrich or a steam-roller would have puzzled him less.

"You needn't mind," said the lady; "it's a very old dress. You'll have to cut the skirt, but it really isn't of any consequence."

By this time Guy had perceived that the skirt of the lady's dress was miserably involved in the chain of the tricycle, whereby her future progress, forwards, backwards, or sideways, was impossible because—well, because it was impossible.

"If we had a spanner, we could unfasten the chain," said the lady; "but I've forgotten my spanner too. I suppose you haven't a spanner in your pocket."

What sort of an amulet a spanner might be, Guy did not know; and he had not even a pocket-knife.

Said she: "This will do," whisking from her pocket a pair of scissors attached to a silver chain. "Take the scissors off the ring, please, and cut away."

The skirt was a plain one, as a cycling skirt should be; but it was unexceptional in style, and Guy, with the scissors in his hand, fell to admiring it sadly.

"Perhaps you are thinking that you cannot do it with your left hand," said the fair prisoner. "I am sorry to see that your right is in a sling."

"That," answered Guy, "is the most fortunate thing in the world. What I am thinking is that your dress will be irretrievably ruined."

"And I," returned the lady, "am thinking that the sooner you free me from this ridiculous position, the kinder it will be of you."

"Then I shall cut you out at once," said Guy, and down upon his knees he went.

A succession of snips strewed the ground with morsels of sky-blue skirt, and at every snip there was a groan.

"Courage!" exclaimed the lady (for it was Guy who groaned). "The hurt cannot be much."

"Alas! madam, 'twill serve," answered Guy, ruefully surveying his work as he rose up.

"You have done it beautifully!" she cried.

"Oh! see what rents I have made," groaned Guy.

But the young lady put out her hand most smilingly.

Guy thought she meant him to shake it, in token of forgiveness on her part, but she did not.

"If you will help me off, please," she said, "I can look myself over."

"When you have done that," said Guy, assisting her to dismount, his countenance as blue as the injured frock, "you will be utterly in despair."

But the siren, with a bright blush veiling her white cheek, only laughed as she observed the injuries she had sustained.

"You couldn't have done it any other way," said she; "and it isn't at all as bad as it might have been. Besides, I am only half a mile from home, so I shall turn back, and push this machine along."

"Be so kind as to allow me to take charge of the machine," urged Guy. "For if you are going to retrace your steps, your way is mine."

"Thank you very much. The machine is no trouble, but if you are going the same ——"

So Guy began to push the tricycle before him, and the sun shone beautifully, and the lady was affable; and when she had gathered the sky-blue skirt elegantly in one hand (as she might have done in any case, on account of the dust), it did not look at all amiss.

"What a lovely and fragrant morning!" exclaimed Guy, who began to be at ease again, now that there was no more mischief to be done with the scissors. "Is not this road beautiful, winding between these high banks, which shade it so

pleasantly? And it is a very well-made road, too, for not only has it that smooth, hard surface which offers the least resistance to traction, but you see that it is convex to a nice degree, sloping easily from the centre to the sides, which is excellent for purposes of drainage. Is not that glimpse of the field with the young corn in it, through the hedge there, charming? These things appeal to you, I am sure. I take great pleasure in them myself. This is my native land, and I have not looked upon green fields for years."

"You have been travelling abroad, I suppose?"

"No; I have been living in Paris."

"Papa is going to Paris next week. He is going to call on some well-known scientific man there—I can't remember his name."

"It is possibly M. Rohand," said Guy.

"No, I don't think that is the name. Is M. Ro——"

"Rohand; R-o-h-a-n-d."

"Thank you. Is M. Rohand one of the great scientific men there?"

"He is a man of the most amazing genius. At present he is very little known, for he does not court publicity. But in a very short time his fame will be enormous. I intend that it shall be."

"Has he done you some great good, then?" asked the pretty tricyclist, peeping with some surprise at Guy out of the corners of her eyes.

"Through him I am about to make a fortune which will be little less than fabulous," Guy answered gravely.

The young lady was now very much astonished, and, being by nature artless and impulsive, she could not quite prevent her face from reflecting some portion of her feelings. Any one must have felt astonishment who, beholding the animated features of Guy, his strange, tall figure, and sorry apparel, had heard his serious, fantastic talk.

She opened her lips to utter some graceful expression of her surprise; but Guy, not perceiving that she was about to speak, waved his left hand towards a cluster of horse-chestnut trees which they were approaching, and said: "What pride is in the gorgeous head of the horse-chestnut! It is two centuries and a half since we imported this tree from India, but it is still haughty and exclusive in its habits. It does not mingle with the natives of the forest—it is at home in the parks of the wealthy, it loves the precincts of a castle, and the stately companionship of colleges. It is right that it should stand for 'luxury' in the language of flowers."

"Those are papa's trees," said the damsel.

"And next week he goes to Paris, to call upon a man of science. Excuse me, but I hope you fully believe that it is a magnificent thing to make a very large fortune?"

"I should think it would be perfectly delightful. I intend to make one myself some day; but, of course, I don't know if it will be as large as yours."

"Ha!" said Guy. "And if, while enriching yourself to an almost incredible extent, you should be enabled at the same time to confer superlative benefits upon the entire mass of suffering humanity?"

The large, almond-shaped eyes of the young lady sparkled delightedly.

"Then you would be twice blest!" she cried.

"I thank you," answered Guy. "Those being your sentiments, and seeing that they are completely in accord with my own, we are now arrived at a point at which I may properly expound to you something of a project in which I am persuaded you will be extraordinarily interested. Will you rest by that trail of honeysuckle, and permit me to recount to you the events of one week of my life?"

To this singular proposal the young lady assented with an entirely gracious air.

She paused, and stood leaning against a fence that surrounded her father's grounds.

Guy then proceeded to tell her who he was, and that preliminary disposed of, he plunged *in medias res*; outlined and filled in, with Rubens-like breadth and warmth of stroke and colour, a portrait of old M. Rohand as the man of the century; passed from him to the powder; and after captivating her heart by an impassioned relation of the splendid benefits which its world-wide distribution was to confer upon humanity, reduced her to intellectual nothingness by the merest hint of the unparalleled commercial future which awaited the promoters of the enterprise.

Before he had half finished his tale an interruption occurred.

The spot where they stood was close upon the skirts of a spacious and luxuriant park, and they were now in reality almost within sight of the mansion which it encompassed.

An open carriage turned out from the park gates, and came rapidly towards them. It was occupied by an elderly and handsome gentleman, at sight of whom Guy's companion laughed and blushed a little.

"It is papa," she said, and added: "But he won't mind, I'm sure. It was really very kind of you. I should have liked to hear the end of the story immensely."

The carriage drew up beside them, and the young lady made haste to offer an explanation to her papa, who bowed politely to Guy when she had finished.

"But you forgot, my dearest Trona, when you started out on your tricycle, that you were engaged to drive with me," he said. "And now you must return at once and change your dress. Get in, dear. John will push the tricycle home, and I will take the reins."

Half a minute later, Guy was once more alone upon the road.

### CHAPTER VII.—HE REACHES HOME.

"IT is certain," said Guy, seating himself upon the nearest bank, "that I am amongst the most fortunate of men."

He removed his hat, and ran his fingers through his long hair, letting the summer wind play upon his large and well-shaped forehead.

"In what manner this beautiful creature is destined to influence my future, I can scarcely yet conjecture; but that she will play an important part in it I cannot doubt. Her name is Trona.

There must be some significance in the name (which I have never heard before), for it begins already to stir certain lively motions in me."

He rose up somewhat excited, and continued his walk until he came to the great iron gates of the park through which the young lady's papa had borne her from his sight.

A broad avenue of chestnut and lime-trees led up to the mansion, which was a large, low, red-brick edifice, with many projections, which chequered it with a bold play of light and shadow; peaked gables, bays, and square-headed windows.

"She has a beautiful home," exclaimed Guy. "It is perfect Elizabethan. In such an abode she should cherish high and adventurous thoughts, not unmixed with poetry of a romantic kind. The room with the wide window, in the left wing, shaded by the beech tree, has a grave and sombre air, and is doubtless her father's study. It is there, probably, that he will invite me to give him some details of the undertaking. On that broad, straight terrace it may be that I shall complete in Trona's hearing the history I was interrupted in just now. Who are they, I wonder? The place was untenanted when I left home."

He turned, and continued his walk; and began to conjure up all that he remembered of her. "There are many evidences of temperament in the hair, but I do not quite know what that rich copper tint may indicate. Her forehead certainly announces capacity. The curve of the chin is undoubtedly expressive of taste, and she has a well-proportioned neck, which is a high recommendation for general strength of character. Her eyes are sanguine—I am certain that I shall inspire her with the most generous and enthusiastic zeal for the enterprise."

So Guy kept on his way, rhapsodising aloud, and sweet imagination still pursued him.

All at once, clapping his hand upon his pocket, he found that he was still in possession of the lady's scissors. He drew them out, and along with them, singular to say, a morsel of the sky-blue skirt.

The scissors folded together, with a fine tortoise-shell handle inlaid with silver, and looked, when shut, like a small pocket-knife. Guy considered them the most beautiful instrument of their kind that he had ever seen.

"Here, again," said he, "is an instance of the signal fortune that attends me! I carry off, without knowing it, a thing that belongs to her. It will be necessary by some means to restore it to her; and thus, by the most natural process in the world, we are once more brought together. It is clear that fortune champions me." Then as the road began to be more familiar to him, and he recognised some landmarks of home, his thoughts turned to dwell upon his mother and sister, to both of whom he was greatly attached.

"They are not expecting me," he observed presently. "So much the better; they will have been at no trouble to prepare for me"—which, by the way, is a mannish and most improper conclusion.

Mrs. Warwick, who had that morning received her dividends from her brother, and who, provisioned for a fortnight, had never a pecuniary care in the world, was at this moment engaged in planting out lobelias. A bushy laurel hid her figure; she was kneeling over the mould, and all that was visible of her from the road was her foot. But Mrs. Warwick's foot, whenever she discovered it, was visible chiefly by virtue of its invisibility. She was a matron with the foot of Cinderella. From a child Guy had delighted in the feet of his mother, which were to him the most ethereal forms in the world of matter. The innocent vanity of Mrs. Warwick permitted her to be of the same opinion. When she put on her boots, she left her slippers on a chair, where casual visitors might observe and wonder at them.

Guy saw the foot of his mother through the laurel bush.

"It is she!" said he. "There is no foot in the world like hers!"

He sprang upon the bank, and called to her.

Mrs. Warwick screamed, and dropped her trowel. She ran to the wicket, her soft, sunny face alight with the pride of a mother's love. Mrs. Warwick and her son had the same enthusiastic fancy, and the same elf-like inability to understand that a quarter's dividends were not a Fortunatus's purse.

"But why didn't you tell us you were coming?" said his mother, when she had kissed him to her satisfaction.

Guy did not answer. She held him so that he could not speak.

When she let him go, Mrs. Warwick surveyed her son, and her face changed to a look of amused dismay. Then she was all concern for his wounded arm.

Guy assured her she would be nothing less than delighted when she heard about that. He praised her freshness and her garden hat and her pretty summer gown, and drew off her old leather glove to caress her hand.

"But how dusty you are, dear!" she said. "You look as if you had walked all the way from London."

"I walked a part of the way; and thereby hangs another tale, mother, which I shall tell you by-and-by."

"Won't Grace wonder!" laughed his mother. "But, Guy, dear, there is nothing the matter, I hope? It is so wonderful your flying home in this way."

"You will think it much more wonderful, mother, when I have explained everything to you. The matter is a great one. But there is nothing to be alarmed about. Where is Grace?"

"She ought to be in now. She went into the village, and I think she will be bringing Mr. Craig, our curate, home to luncheon. But you have not told me about your arm, dear. Is it broken, Guy?"

"Oh, no, mother—no. A little scratch in fencing, but the most fortunate thing that ever happened to anybody."

"My dearest boy, how you do talk! Do you mean that you have made a fortune by getting yourself wounded?"

"You have almost hit upon it, mother; but wait until I tell you. Now, if you will come and bathe my arm for me, that will be better for it than a magic lotion."

CHAPTER VIII.—AND IS DRIVEN OFF AGAIN AT ONCE.

"IF it turns out all that, you know," observed the curate, "it will make—what shall we say?—a regular chapter in the romance of life-preservation."

"Very good, Mr. Craig; very good indeed!" said Mrs. Warwick.

But, if the truth be told, the curate's mind was not quite resolved upon the subject. Being an ardent admirer of both ladies, he faced a little both ways; and now shook with the hope that transported Guy and Mrs. Warwick, and now was harried by the plain commercial questionings of the less romantic Grace.

Luncheon was over, and they were sitting in the garden. Guy had dazzled them and puzzled you would have thought, to hear him talk, that he had his whole vast project "safe beneath his hat."

"You are quite right," he said, addressing himself to the curate, "and I may say here that I expect great help from the clergy in this matter. It should be the text of powerful discourses from innumerable pulpits. For several days I have been much occupied with the question of national food. A great reform is necessary here. Our feeding has become far too gross and vulgar an affair. This simple yet potent substance, which all of you have tasted, is enough, and it is as easy of digestion as bread."

"But Guy, dear, what about the five hundred pounds?" said his sister.

"Of course, it won't do to lose sight of that altogether," observed Mrs. Warwick.

"AND WHERE IS SHE? AND WHAT IS SHE LIKE?' QUERIED GRACE.

them to his heart's content. His mother alone had followed him in his most extravagant flights; but she, at any rate, was persuaded that it was a most beautiful scheme, and so simple too. She had already commenced to spend the profits of it.

Grace, whom domestic experience had made very clear of hearing on the prudent side, and who was for steering on no undetermined shore, kept on questioning apace.

The curate had a parlous time of it to keep in countenance with both. He could not have told you yet whether he believed Guy to be the vainest of dreamers, or destined to bless his race immeasurably. His worldly knowledge dimly guided the decision of a doubtful choice.

But Guy, making light of questions, rode gallantly on the flood-tide of his own imaginings; and

"In fact, it is badly wanted," added the curate.

"What principally troubles me on that score," answered Guy, "is the ridiculous smallness of the amount. Five hundred pounds! What financier would warm to such a sum as that? It has been a great trouble to me from the first that I could not prevail on M. Rohand to charge me at least ten times that amount."

"But, my dear boy," urged Mrs. Warwick, "I really think we ought to be grateful to M. Rohand for not having done so."

"And so do I," rejoined Grace. "It seems to me that we shall have trouble enough to raise five hundred pounds, let alone five thousand. Who is going to lend it to you, Guy?"

"The capitalist whom I shall first approach—whoever he may be," responded Guy.

"But you know, dear, there isn't a capitalist in the family, and we haven't a single acquaintance amongst people of that sort."

"Then, as it happens, I'm luckier than you, Miss Warwick," said Mr. Craig, with that thorough-going geniality which helped to make him the best curate in the world. "We have a capitalist in our family, and no end of a one. He is starting companies all the year round. This will be the very thing for him. I'll wire him to-night, and we will all lunch with him in the City to-morrow. They're awfully good at luncheons in the City, you know. If you don't mind, I'll go and telegraph to him at once."

"You must allow me to offer you a hundred pounds for the introduction," said Guy, quietly. "No, no; I insist upon it. It is a matter of business. It is the way these things are always done."

"Well, well, well; let every man make his fortune who can," laughed little Mr. Craig, as he rose to take his leave, with as much notion of accepting a hundred pounds as he had of receiving a bishopric at Michaelmas.

The ladies, a little exhausted by these lavish prospects, fell back upon their work-baskets.

"Mamma, dear, have you taken my scissors again?" asked Grace.

"Scissors!" burst out Guy, tingling with a fresh emotion—"scissors! Why, that reminds me of something else. I am in love!"

"In love!" cried both the ladies at once, each laying hold of Guy, who was seated between them on the garden bench.

"Why, this is ten times more important than your powder," added Grace. "Why didn't you tell us before?"

"Well, it is, at least, very interesting," said Mrs. Warwick; "but are you serious, my boy? You were never in love before, as far as I can remember. Who is the lady?"

"And where is she, and what is she like?" queried Grace. "And you have done nothing but talk about the powder all this time, and you only remember her by a pair of scissors!"

"Not at all," clamoured Guy—"not at all. I remember her by her hair, and her eyes, and her voice, and a hundred other things. I remembered her by her scissors, because I have got them in my pocket—here they are. Her name is Trona, and this is a portion of the dress she was wearing this morning."

"It is Miss Gault!" ejaculated the two ladies with one voice.

"Is that her name?" said Guy. "Yes, these are her beautiful scissors, and this is a morsel of the skirt of her dress which I cut off with them."

"Well, that's the most extraordinary love-token *I* ever saw," said Grace.

"The road where we met is strewed with fragments just like this," said Guy; and his mother and sister looked at him incredulously, and with increasing wonderment.

"But this doesn't sound at all like a love-affair," was Mrs. Warwick's comment.

"No," added Grace; "it sounds like a frightful quarrel."

"It was in this way," said Guy, and he explained to them the episode of the tricycle

Mrs. Warwick and Grace listened with expressions of the liveliest interest.

"How very funny that you should meet her like that!" Grace observed. "And it's all the more interesting because I made Miss Gault's acquaintance only last week, and she said she intended to call. She rides about everywhere on her tricycle, but scarcely any one in the neighbourhood knows them. Mr. Gault is supposed to be a sort of invalid, but it's my belief that he doesn't think the people about here good enough for him. At any rate, they hardly do any visiting."

"If she should fall head over ears in love with Guy—as, of course, she might very well do——" began Mrs. Warwick.

"My dear mother!" said her son.

"Well, yes—she may, of course, have done so already," continued Mrs. Warwick.

"But no—but no," said Guy, almost piteously; "I would not on any account whatever that she should fall in love with me at that rate. She must be wooed. I must do something to make her enamoured of me."

"Does she know who you are?" asked Grace.

Guy was about to answer that he had told her of himself and his family, when the sound of the stopping of carriage-wheels interrupted him.

"It is Mr. Gault's carriage," whispered Grace, excitedly, half rising to peep over the hedge.

"Just so," answered Guy, complacently. "She has told him, and, quite naturally, here he is. What could he do but come? In the course of a few days the entire county will be coming. As I said to M. Rohand, my difficulty will be, not to find, but to select my colleagues in this enterprise."

But neither Grace nor Mrs. Warwick herself paid the slightest heed to Guy's grandiloquence.

Mrs. Warwick hurriedly whispered her daughter to order tea—"Uncle George's service, dear, and the apostle spoons"—and prepared to receive her visitors.

Guy advanced to meet them at the wicket. The carriage was a splendid and most luxurious equipage, swaying on springs of exquisite contrivance, and cushioned to resist the slightest annoyance from vibration. A footman held open the door of the carriage while Miss Gault, who was the first to alight, descended, in a cream serge frock this time, with a crimson belt about her flexible waist, and a little sailor-hat lightly crowning her loose-blown hair. Mr. Gault, who looked the picture of physical health, got down after his daughter, as tenderly as though he were plagued with aches in all his anatomy.

"This is a very sudden and unceremonious visit, Mr. Warwick," said Miss Gault; "but the truth is papa will not rest until he hears everything about it from your own lips."

"I cannot help thinking from what my daughter has told me, Mr. Warwick," put in Mr. Gault, bowing politely, with the most amiable smile, "that you have arrived at the Philosopher's Stone of Dietetics. Am I right? But you will be so kind as to explain it to me at length, will you not? Yes, the subject is one in which I am profoundly interested. A sadly defective constitution obliges me to guard continually against the snares of the table.

Perfect simplicity in solids and in liquids is the ideal I am always seeking to attain. This preparation of yours, I really believe, must be the sanative I have been searching for these ten years. But there is one question I must beg you to answer at once—is it palatable?"

"I consider it amongst its chiefest virtues," answered Guy, "that it is absolutely tasteless."

"That will do just as well," returned Mr. Gault, after a moment's hesitation. "Indeed, I am not sure, with you, Mr. Warwick, that it is not a very great virtue. Flavours which are not of the essence of the food are always to be distrusted. . . When shall we proceed to the *experimentum crucis*?"

"The what?" asked Miss Gault.

"I mean, dear, that I am extremely anxious to see and taste the preparation for myself."

"Pray come up to the house," said Guy. "I have a little of it with me."

They had been standing close to the garden gate, at an angle of the path whence the cottage was hidden from view. Guy led the way to where Mrs. Warwick, serene of face and tremulous of heart, sewed with a purposeless needle.

There was something so winning in the manner of the healthy hypochondriac that one was at home with him, and liked him, immediately.

No, he would not take tea; it was years since he had permitted himself that luxury; but while the others sipped their cups, he praised the apostle spoons, and regretted the decay of the beautiful art of the silversmith.

Guy, after five minutes' communing with himself, decided on Mr. Gault as the chairman of the company, and produced the powder.

Mr. Gault took a small magnifying-glass from his waistcoat-pocket, and examined it minutely.

"Its appearance recommends it most strongly," he said, when he had finished his scrutiny. "I was a little doubtful about the colour at first, but the test of the glass reassures me. Now, please, advise me as to the best way of tasting it."

"You must clearly understand," said Guy, "that its effect is not instantaneous."

The ladies played the part of a silent but observant chorus. To Mrs. Warwick the scene was intensely real; Grace kept a shrewd and speculative countenance; and the ghost of a smile (was it ironic or sympathetic?) hovered on the sensitive lips of Miss Gault as she, in her turn, examined the powder through her father's glass.

"You propose to dine at a certain hour to-night," continued Guy. "My advice to you is to countermand your dinner, or to eat none, and to take a small quantity of this instead. You will awake to-morrow more vigorous and refreshed than if you had dined to perfection on the choicest artificial foods."

"Admirable!" cried Mr. Gault. "It has long been a problem with me how to dispense with dinner. The process of digestion after an ordinary meal irks me beyond words. It is so gross, so humiliating. How much of mental and spiritual activity is wasted in the three or four hours that are needed to digest a modern dinner!"

"But at home, papa, we never dine like the moderns," said Trona, in whose tone there was a zephyr-like echo of regret. "Do you know how the Hindoos dine?" she whispered to Grace.

"My dear," said Mr. Gault, sweetly, "the cook is the cause of civilisation, and civilisation cannot be cured until the cook is abolished."

"But wouldn't you have any more civilisation, Mr. Gault?" exclaimed Mrs. Warwick.

"There is not a physical ill in the world that is not directly traceable to it," responded Mr. Gault. "The trade of medicine, which is one of the most lucrative in these days, would become obsolete in a generation if we could make up our minds to live on raw wheat and milk."

"Do you think there is a fortune to be made out of Guy's powder, Mr. Gault?" asked Grace.

"A fortune?" said Mr. Gault—"a fortune? I rather shrink from that idea. The only people who make fortunes are those who are below, and in opposition to, the best intellects of their day. It is a mere question of rigging the market. No one ever yet made a fortune who at the outset proposed to himself to benefit his race."

"But there is always an exception," said Guy, gravely. "I propose to do both."

"Then there is nothing for it but to float a company," said Mr. Gault.

"It is for that purpose that I am here," said Guy.

"Then I must of course assist you," returned Mr. Gault. "It is against my principles, for when you talk of companies you talk of dividends, and there is not a step between dividends and adulteration. In fair dealing, dividends are impossible; the public has to pay the piper for the shareholders. But if a purely philanthropic company were possible——"

"That is precisely the company I am bent upon promoting," interrupted Guy.

"In that case," said Mr. Gault, "I must ask leave to take you home with me this very night. We must discuss this matter intimately. I had intended to start for Paris to-morrow on a dietetic mission of my own. You, however, have given me quite a new idea. I must have you at home with me to discuss it. We shall evolve the plan together: let us dine together on the powder at seven o'clock to-night."

"And am I to dine on the powder, papa?" asked Trona.

"My dearest," exclaimed Mr. Gault, "I had almost forgotten that you were with us. Have you not ordered dinner?"

The very brusqueness of this remark on Mr. Gault's part showed the complete ascendency which Guy and his idea had already obtained over him.

Mrs. Warwick and Grace had no thoughts about that, but they had both begun to be sorely troubled about something else. The truth is that Guy's attire was barely respectable. His trousers were distended at the knees, and there was a fine polish on the elbows of his threadbare jacket. Had he a dress suit in his portmanteau—and when would the portmanteau arrive? Mrs. Warwick would have given much for a private word in her son's ear on this subject. But this was the more difficult to obtain for the reason that Guy himself had not a

qualm about his personal appearance, and, while seemingly doubtful as to the propriety of accepting Mr. Gault's invitation, was merely balancing in his mind the probable relative advantages of that gentleman's assistance and Mr. Craig's. He decided that Mr. Gault might prove the more useful man of the two, and having reached that decision he remembered that he was also desperately in love with Trona.

He said that he would dine with Mr. Gault.

"Then if Mrs. Warwick will permit me," answered Mr. Gault, "I will take you home with us at once. We shall not let you return to-night, you know; and forgive me if I suggest that the powder is the only luggage you need trouble yourself with."

Mrs. Warwick and Grace breathed more freely at this, but the former hastened to add that Guy's portmanteau should be sent after him the moment it was received.

Guy and Mr. Gault and Trona drove away in the beautiful barouche, and the events of the morning and the evening were like a dream to Mrs. Warwick and her daughter.

## NATURAL HISTORY NOTES

### THE URCHIN-FISH—DIODON HYSTRIX.

NO one who has ever seen this formidable yet beautiful fish alive can possibly forget it. Towards the close of the year half a dozen Urchin-fish may be seen gliding through the water in single file, almost touching each other. They are very plentiful in the south seas, often attaining the length of two feet. The back is a light grey; the under-part pure white. The entire body is covered with spines, mostly triangular; but some, which are larger than the rest, are perfectly round. At the base of each spine is a round black spot. These spots are mostly small, with here and there a large one. The Urchin-fish has no true teeth, but the jaws are covered with a substance resembling ivory, well adapted for grinding down the crustaceans and sea-weeds on which it subsists. It is frequently speared in our lagoons, and the flesh invariably eaten. The remarkable power of inflating its body into a globular form, and thereby causing the spines to stand out in all directions, has given to it the name of globe-fish. When thus inflated, it floats and swims on its back in perfect safety. This power of distension is evidently intended as a means of defence. Nevertheless, it sometimes (when napping) comes to grief; for a small specimen was ingloriously captured at low tide in the lagoon by a hog! Urchin-fish are occasionally swallowed alive by hungry sharks and large fish. As it instantaneously dilates its stomach and erects its spines—some of which are two inches in length—it is not so easily disposed of. In the violent effort to get it down, the spines become firmly embedded in the throat, thus strangling its adversary. I have known instances in which the shark and the cavally have been easily captured by natives whilst the fatal struggle has been going on.

At Aitutaki a native who went fishing alone in a canoe put his hand into a crevice in the coral "to feel for fish," little thinking what a terrible enemy was there. A large Urchin-fish that happened to be inside, irritated at the sight of a hand extended to catch it, inflated its body and erected its spines, rendering it impossible for the poor fellow to withdraw his arm. An empty canoe drifting with the current revealed his fate. When the body was discovered, the arm—horribly lacerated in the unavailing struggle—was still imprisoned by the irate fish.

A specimen eighteen inches in length, lying before me as I write, was sighted in a large hole. The fisherman seized it by the mouth, but his thumb was so severely bitten that he speedily let it go. Knowing that the tail is free from spines, he grabbed it, and succeeded in pulling it out, despite its rage and erected spines. It was brought to me dead: yet I found that by blowing steadily into its mouth it became a perfect ball, the multitudinous spines all erect.

The tough, thick skin of the Totara (its native name) may be easily taken off and dried. The Gilbert islanders, until lately, made helmets out of these dried skins. The tail was allowed to remain as an ornament at the top; the interior—lined with shark's skin—was well filled with sand, and the lower part brought down over the ears. The effect was very striking; and the utility in savage warfare beyond question. A complete set of armour made of twisted cocoa-nut fibre completed the equipment of the warrior. Their spears, armed with triple rows of shark's teeth, were sometimes twenty feet long.

When sailing in the John Williams on a rough day a pair of globe-fish of the genus *Tetraodon lævigatus* seemingly piloted our vessel from dawn to sunset. Albicore and sword-fish passed them without attacking them—probably because the liver is poisonous.

The natives of the Hervey group call a cross-grained fellow a Totara, or Urchin-fish.

### FLYING-FISH.

A capital plan to relieve the monotony of a long voyage in the Tropics is to perch yourself on the bowsprit of your vessel and watch her cleaving the billows and throwing a line of snowy foam right and left. Alarmed at the approach of the seeming monster of the deep, flying-fish rush off on either

side with vast speed. In rough weather very few are seen. They are most plentiful when the sun is bright and a light breeze sweeps over the ocean. Upwards of thirty species of flying-fish are known.

In the South Pacific the principal season for flying-fish is from August on to the end of the year. The genus *Exocœtus*—in size about that of a fine mackerel—has the pectoral fins nearly as long as the body. It skims along the surface of the water like a bird, for which at a distance it is easily mistaken. They often fly a distance of 200 yards without once moistening their beautiful fins. The direction is usually straight; but they often curve their flight most gracefully. Single fish may be seen in flight throughout the year; but in the season hundreds at one time. Nothing can be more elegant than the movements of a shoal of flying-fish through the air as they turn on their sides, fully displaying their wonderful fins under the full blaze of a tropical sun.

I cannot believe that terror alone causes them to fly. Surely it is often in sport, from the mere pleasure of existence. They really do fly, and not simply leap out of the ocean. It is utterly incredible that a fish should propel itself through the air at a uniform elevation above the level of the ocean for a distance of 200 yards or more by a mere spring. They occasionally rise to a height of twenty feet above the water, but usually skim along near the surface, occasionally moistening their fins in the crest of a billow by the way.

Flying-fish, attracted by evening lights, frequently leap through the open ports of the largest vessels into the cabins of the passengers, not a little to their astonishment. During a cruise through the South Pacific in the John Williams, flying-fish leaped on to the main deck every night. Pussy was so accustomed to hear the thud that she would start up to secure the prize. The rule was to allow puss to have the first for her supper, the rest being reserved for our breakfast. This sport went on night after night, week after week, furnishing a very acceptable addition to our usual diet. Flying-fish should be eaten with a little butter, otherwise, although delicate in flavour, it is rather dry.

The low coral islands are abundantly supplied with flying-fish; but they are not found inside the lagoons. In the Hervey group the island of Atui is famed for them. The natives have an absurd legend that a mighty magician, an ancestor of theirs,[1] originally brought them from Rakaanga!

About the end of August the ocean seems to be alive with flying-fish. At such times they are easily caught at Atui *by daytime* with nets, as many as 1,500 having been obtained by a large canoe in one day. The islanders eat as many as they can; the remainder (as they have no salt) are well dried in the sun, for use when the season is over. Dried flying-fish are packed in baskets and sent to friends on less favoured islands, the appearance being exactly that of fine red-herrings. On Mangaia the fish is baked and rebaked in the native oven until it is perfectly dry. When eaten, it is well steeped in a rich sauce.

In the month of February the spawn may be observed floating on the surface of the ocean—a vast mass of greenish globules loosely glued together. Flying-fish have been noticed pressing against our ship's rudder, possibly to assist the act of spawning.

This interesting fish has numerous enemies. Coryphene, albicore, baracoota, bonito, etc., etc., feed almost exclusively upon flying-fish in the season. Frigate-birds, tern, tropic-birds, etc., etc., do the same. Anglers for baracoota first catch a few flying-fish as bait. I have taken two fine flying-fish out of the stomach of a baracoota.

At Rakaanga flying-fish are captured in the following manner:—At sunset a number of flat-bottomed boats are paddled out to sea in a straight line, the foremost carrying a lighted torch. (A native fisherman at night wears only a girdle, through fear of his clothes catching fire.) When it is sufficiently dark the leader gives the word, and lights the torch of his nearest neighbour; and so on and on until the entire expedition is lighted up. A torchbearer attends exclusively to his flambeau, and there will be several in the larger boats. He now raises his torch aloft, the other boats doing the same. A scene of great interest ensues. At the sudden flash of between 200 or 300 torches the fish start up in terror, and rush upon the boats, sometimes striking the fishermen with considerable violence. Many fishermen have been temporarily blinded in this way. Scoop-nets attached to long poles are used. Great numbers of flying-fish are thus caught in a short time. Hence the ancient proverb, "Bonito and flying-fish are *insane*, as they come to grief for nothing, the former seduced merely by the brightness of a pearl-oyster hook, the latter by the glare of torches." The application of this proverb is very obvious.

The favourite nights for catching flying-fish are from the ninth to the twelfth of each lunar month. The Hervey islanders *chase* flying-fish; the natives of the low coral islands merely wait for them.

Another sort of flying-fish common in the Pacific is the flying-gurnard (*Dactylopterus orientalis*). It attains the length of fourteen inches, and has mailed cheeks and a hard rough skin. It is very palatable. Its flight is much shorter than that of the exocœtus, or ordinary flying-fish, never exceeding forty yards. The motion of the flying-gurnard is not a true flight, but a prolonged leap. It flies half upright, not horizontally, like the exocœti. It emits a phosphoric light, which is very striking to the observer. On account of the supposed resemblance of its head to the urchin-fish, it is called by the Hervey islanders the "Urchin flying-fish" (marōrō totara).

WILLIAM WYATT GILL, B.A.

# STUDIES IN CHARACTER.

## NAPOLEON I.

THE picture of which we present an engraving to our readers has sold for the largest sum ever given for square inches of painted canvas. The exquisite finish of Meissonier, the technical qualities of the work itself, count for much; but the subject of the picture, the halo that still surrounds the Napoleonic legend, counts perhaps for more.

Whatever judgment may be passed on his career, was it fruitful or unfruitful, was it a mixed good or an unmixed evil, it is impossible to deny that Napoleon was a great man, a mighty individuality. Greatness is an epithet that must be sparingly attributed to men. Indeed, if we examine closely the performances of the most of those whom history has labelled "great," we feel inclined to wish that the race of great ones may cease from the earth, and that the time may come when none of the leaders of nations may be styled great, because desolation and terror have waited on their footsteps. Great men are said to be the children of great times. It should rather be said of bad times.

Of all the great conquerors and mighty statesmen who have been the scourge of humanity and the curse of their country, there is no more interesting figure than that which is here depicted for us by a master-hand. We see Napoleon at the head of his gallant soldiers, close behind him his brilliant staff, each man a hero. The leader is sunk in sombre meditation. The lion is in the toils, or rather the gambler is playing his last stake. He plays it with masterly skill. Unsuccessful as he was in 1814, none of his campaigns brings into clearer light his brilliant powers, none sets in stronger relief his utter selfishness and reckless cruelty.

The Allies are marching upon Paris in overpowering numbers. To protract the struggle is to linger out the death-agony of his country. Patriotism and prudence counsel peace, but peace means at least abdication. The destruction of his country's forces can bring to him, the individual, nothing worse, and there is always a chance. "What to me are the lives of a million men?" he had said shortly before this to Metternich, who had urged upon him the uselessness of further fighting. What indeed! Your conqueror must steel his bosom against any weak complaisance to the instruments with which he works out his selfish ends. It is not on record that Napoleon ever expressed the slightest compunction for the millions who were sacrificed to his ambition. The astonishing fact remains that the instruments should have been on their side so complaisant. With what enthusiasm they rushed to death for their Emperor! *Vive l'Empereur!* With what equanimity he received their devotion!

Strange and puzzling phenomenon, the best and worst of human nature so closely connected, so inextricably intertwined! To regard the French nation as essentially vain and frivolous, sacrificing everything for glory, as led away by a tempter, hypnotised by an intellectual devil, may satisfy those who are fond of short cuts and easy methods in history, who think they have solved all moral and political problems when they have pasted a label on an individual or a nation, but cannot satisfy the patient investigator who regards history as the school of experience teaching by example, and seeks to avoid the errors of the future by studying those of the past.

There is not probably a more difficult problem presented to the historian than that of disentangling the causes which rendered Napoleon possible, and making the man himself thoroughly intelligible. The greatest minds of our century have felt the fascination of this inquiry; and how diverse have been their judgments! An ancient Greek could have found in such a career as that of Napoleon an exemplification of his doctrine of the divine jealousy which infatuates the too fortunate man with an overweening sense of his superiority, and punishes him and his even to the third generation, through the consequences of their own presumptuous imaginings. He who sang the dirge of the Persians might have chanted in no meaner strains the overthrow of a mightier host slain by the Ice King, and judged while he lamented the Imperial eagle chained on the rock of St. Helena.

Bonaparte himself loved to regard his career as a special embodiment of fate. He used to speak of himself as the child of destiny. He got the length even of putting himself outside the pale of humanity, and regarding himself as on a level with the blind forces of nature. "I am not a person," he said; "I am a thing." He constantly appeals to his star; he bears a charmed life; success follows a chained captive behind his chariot. This feeling has been common in different forms to most men to whom it has been given to accomplish deeds great beyond their expectation. A kind of surprise at their own success settles upon them. Sulla believed that he was the special favourite of fortune. Alexander the Great came to believe that he was really the son of Jupiter. We have the feeling of this wonder at themselves expressed in the *Veni, vidi, vici* of Cæsar, and in the "It is the Lord's doing" of Cromwell.

However much Napoleon may have himself believed in his star, and wished others to believe, no one ever left less to chance in the way of careful preparation. Wild as his schemes often were, they failed through their own inherent weakness, not through lack of attention to detail on his part. Take for example the expedition to Moscow. Mad it was, and doomed to failure; at least, it seems so now. But with what patient duplicity were the negotiations conducted so as to blind the Emperor Alexander to his enemy's real designs, and with what marvellous care were all the details of dress and armament thought out! The carriage built in Brussels specially for this campaign according to the Emperor's own direction, and on which so many of us have sat at Madame Tussaud's, is itself a proof that no detail was too trifling for this marvellous intellect.

In Napoleon's mind there was an extraordinary combination of sobriety of judgment in ordinary matters, with a wildness of imagination that was ever prompting him to hunt after chimeras. Given any object, he was the best man to find out the means to attain that object, and the least scrupulous so long as success crowned the work. He must have become an important actor on any stage. The stage itself was comparatively indifferent to him. When a poor lieutenant starving in Paris, he resolved to offer his services to the Government for employment in Turkey. The offer was accepted, and already he saw himself in imagination Emperor of the East. The order was countermanded. How would the ruling powers have expedited his departure could they have foreseen that the little Corsican soldier of fortune would become Emperor of the West! This wildness of imagination led him afterwards to Egypt and to Acre, where gigantic projects were shattered. The same led him to plan the invasion of England, for which such wonderful preparations were made at Boulogne; and after Trafalgar had rendered that hopeless, the same ardent imagination conceived the continental system which was to extinguish English trade with Europe.

Of the Moscow expedition we need say nothing. It is an object-lesson in the school of history which he who runs may read. It is curious that all these grand ideas ended in fiascos—or rather it is not curious, for they carried with them their own condemnation; but it is sad that, after all her victories, after all the blood and treasure wasted, after all the kingdoms quickly gained and quicker lost, France had less territory when she had done with Napoleon than when he became her general; and what of the answer to the cry of the mothers which rang in his ears as he skulked through Provence on his way to Elba, "Give us back our sons"?

Yet the fascination which he has exercised over the French and the magic of his name are undeniable. Perhaps we are not far enough removed from his times to do him justice, and something must be allowed for difference of national taste. Our grandfathers hated him cordially. To them Boney was an ogre who was always threatening invasion, and to whom heavy taxation and high prices were due. Of the latter we may judge from the fact that on March 5th, 1801, the price of the quartern loaf was 1*s.* 10½*d.*, and that, most likely, largely composed of ground rice. A man with a dear, badly baked loaf on his stomach is not in a condition to judge of a great political enemy impartially, and perhaps our forefathers were a little ungenerous in their judgments, and they might perhaps have made him a little more comfortable in St. Helena. But Longwood, if not quite the place where an anointed Emperor would have chosen to end his days, would have been much beyond the expectations of a lawyer's son of Ajaccio, and was certainly beyond the deserts of the murderer of the Duc d'Enghien and of Toussaint l'Ouverture, or of the man who in cold blood and out of politic considerations had 2,500 prisoners of war shot on the sands of Jaffa.

Yet, after all, it is a wonder that Napoleon was not guilty of greater crimes. Wielding absolute power, he could be even generous on occasion to his political foes. His cruelty was politic. It was a matter of calculation, not of passion. The Duc d'Enghien was put to death, not out of personal hatred—Napoleon had but shortly before become acquainted with his existence—but in order that his fate might strike terror into the hearts of the Bourbons. Palm the German writer, Hofer the Tyrolese patriot, were put to death, and Prince Holzfeldt would have been sacrificed, for the same reason. In fact, it was comparatively a matter of indifference whether the individual executed was innocent or guilty so long as an example was made. It was this same studied barbarity which drove to suicide Villeneuve, the gallant admiral who fought, in defiance of his better reason, at Trafalgar, obedient to a tyrant's behests. Napoleon was not so much cruel as absolutely indifferent to considerations of humanity when these seemed to interfere with the success of his plans.

His very outbursts of anger were adopted frequently for politic purposes. After one scene of this kind he could boast that his anger never rose higher than his throat, that his intellect remained unruffled. This kind of calculating fury rendered him peculiarly dangerous. But there were times when he was more than ordinarily moved, particularly after a batch of London newspapers had come in and he had read some of the kind things which were said about General Bonaparte. Then the celebrated cocked hat would be kicked into a corner, and language would resound through the Imperial chambers much more in keeping with the character of the ex-artilleryman than with that of the reviver of the empire of Charlemagne.

There is no doubt England was a terrible thorn all through in Napoleon's side. His expedition to Egypt was intended to deprive us of our Indian Empire, and when his direct attempt at invasion failed later on, he conquered Europe, as he himself declared, in order that he might destroy England. He hated our free institutions, although it is amusing to find him proposing to overthrow the English oligarchy in order to give England freedom and equality. But the English idea of liberty, equality, and fraternity was a slightly different one from that of their neighbours, and English Tories were not oligarchs. John Bull felt himself quite competent to work out the development of his own institutions

without foreign assistance. It was because England was a free country, and because the English people were at one with their rulers, that they were able to rally the Continental Powers and breathe heart into them from time to time.

At first Napoleon was opposed on the Continent by kings and statesmen with their old-fashioned methods of statecraft. The generals who opposed him complained that they were beaten contrary to all the rules of the game. Napoleon never attacked quite in the way he ought to have done, nor did he always turn up just where he was expected. It was never dreamt of for a moment by the Austrians, who were besieging Genoa that he would cross the Alps and bring his artillery with him, and court destruction by placing himself in their rear. Mack at Ulm was surrounded and captured before he knew that Napoleon had crossed the Rhine. The tone of mind of kings and emperors is amusingly portrayed, with a dash of caricature, no doubt, by Napoleon himself in one of his reminiscences. "When," he says, "I was at Tilsit with the Emperor Alexander and the King of Prussia, I was the most ignorant of the three in military matters. The two sovereigns were completely *au fait* as to the number of buttons there ought to be in front of a jacket, how many behind, and the manner in which the skirts ought to be cut. In fact, I was nobody in comparison with them."

These were great times. It is impossible not to read with profound satisfaction how these kings and rulers, by so-called Divine right, had to bow down to the man who was a leader by personal force alone, whose diadem, such as it was, had been won by merit. We see him sitting at the head of the table to which none beneath the royal rank was admitted, and we are not shocked to the depths of our being, as the royal chamberlain was, when he begins his story of the time, "When I was a sub-lieutenant in the Regiment la Fère." It is with very different feelings that we assist at a later banquet, and hear the same voice relating an occurrence "which happened in the time of my late uncle, the King." The sub-lieutenant had by that time married the niece of Marie Antoinette.

At first, no doubt, the sympathy of the peoples of Europe, as distinct from that of their rulers, was with the French. The ideas of the Republic found a response in the hearts of the nations, and everywhere there was the hope of the dawn of a better day. The proclamation of Napoleon that the French army had come to break their chains was at first believed. His own behaviour, his very look, the pale face, the frail body consumed by the fire within, his studied simplicity, his surprising austerity, his laconic speech—all seemed to point to the reappearance on earth of one of the heroes of antiquity. It was not a real antique, however, but only a plaster-of-Paris. Yet for a time it imposed on all. Even his own friends knew him not. In 1797, when it was reported that Napoleon was thinking of making himself King of Italy, Madame de Staël asked Angereau, then in Paris on a mission from the army of Italy, if this were the case. "Certainly not," he replied; "he is a young man of far too good principles for that."

His power of impressing individuals was marvellous. The sweetness of his smile when he chose to please was irresistible; his words could raise refreshing visions real as the mirage of the desert. Those upon whom he operated were for the time mesmerised; the disillusionment was usually cruel. We find Lafayette believing in him up to the very eve of the perpetual dictatorship. "It is impossible," he said to him, "that you, General, the first in that order of men who to find their equals and to claim their true place embrace all centuries, should wish that such a revolution, so much blood, so much sorrow, so many victories, so many prodigies, should have no other result than an arbitrary régime."

Impossible; but then, as Marmont says of him, "there was so much future in his mind." When he was being conveyed to Elba on board the "Undaunted," he won the hearts of all the crew except old Hinton the boatswain. Everything on board pleased him. "Humbug!" ejaculated old Hinton. There was no people on the world but the English, the rest were only so many populaces. "Humbug!" said Hinton; but the crew thought Nap not such a bad fellow after all, and when Napoleon at parting distributed 200 gold pieces among them, they wished his honour long life and better luck next time. The verdict of history is, we are afraid, that of old Hinton—humbug!

But in looking back at an historical character there is this element of unfairness, that we judge everything in the light of the results; we see as from a distance the main features; the ocean has no islands, the desert no oases. We desire consistency; and by a kind of refinement of injustice we twist to evil even the good qualities of a man who has been guilty of some conspicuous wrongdoing; we see in these so-called virtues only the cloak of hypocrisy added to villany. Napoleon has been a conspicuous sufferer in this way. What in another would have been kindness and generosity appears in him deep design and cold calculation. We admit his superiority of intellect, and indemnify ourselves by denying his goodness of heart. Here we go too far. At Arcoli, Muiron seeing a bomb about to explode, threw himself between it and his general, saving his life at the cost of his own. They were old friends. The man for whom Muiron died and whom Josephine loved could not have been altogether bad.

It was something more than mere calculation or aiming at effect that led Bonaparte to put a stop to the cruelties of the revolution. An old man of 80, an emigrant, had been shot at Toulon according to the then law. Bonaparte strictly reprimanded the military commission who had passed this iniquitous though legal sentence. "The soldier," he said, "who signs a sentence of death against a man incapable of bearing arms is a coward." Can this be the same Napoleon, we ask, who in his will left a legacy of 10,000 francs to the would-be assassin of Wellington? "Cantillon had as much right to assassinate that oligarchist as the latter had to send me to perish upon the rock of St. Helena."

In judging of Napoleon's moral character we must make great allowance for the corrupting influence of the circumstances in which he found

himself placed. The weakness, the self-seeking, the corruption of his contemporaries were almost enough to justify him. What they tried to do, he did. When a tyrant becomes possible in a country, there must be a fatal proneness to slavery in the people, the neck must be presented for the bridle. From the first, Napoleon felt his superiority to other men. "The men with whom I live have tastes which differ as much from mine as the light of the moon does from that of the sun." On another occasion he says, "What was I to do? Sieyès put shadows on every side; shadow of legislative power, shadow of judiciary power, shadow of a government; it required substance somewhere, and, in faith, I put it there." Take the following as an example of the men with whom he had to deal. Certain funds were reserved in a coffer at the Luxembourg to be employed by way of indemnity to outgoing directors. "Look at this fine piece of furniture," said Sieyès one day to the First Consul; "perhaps you do not suspect its value?" He then informed him of the existence of these funds, and asked what should be done with them. Sieyès had a face on which "Give" was legibly written, and Bonaparte, struck by the look of greed, replied: "If I know of its existence, the sum will go into the public treasury; but if I am in ignorance, and as yet I know nothing about it, you can divide it with Ducos." Need it be said that Sieyès hastened to do so, and took to himself the lion's share. Admirable power of managing men, great administrator! Yes, but the results of such administration,—are they to elevate or to corrupt?

Napoleon had a fine contempt for those who went off on side-issues, who deviated from the path to pick up any number of golden apples; his part was to fling down the golden lure. Napoleon was no Washington. He might have been the President of a great Republic strengthened and regenerated by his great powers. But to him self was first, all things else subordinate. He worked, no doubt, for France, and gave her the benefit of his immense administrative ability; but it was for a France which he regarded as his own property. There was, no doubt, the other side to all this. "Bonaparte," exclaimed Sheridan, "has made a pact with the French. They consent to obey him, only on condition that he makes them masters of the world." The excesses of the Revolution had disgusted the people; they were ready to give up a great deal for the sake of order and safety. Napoleon was at first hailed as the saviour of society. When their trust was betrayed, was it entirely the fault of the people?

Napoleon excused himself by the necessity of dazzling with pomp and paraphernalia of power a vain and frivolous nation. Speaking of the Legion of Honour in the Council of State, he lays down this principle: "You call it a toy; well! it is with toys men are led. I do not believe that the French care for liberty and equality; ten years of revolution have not changed them; they are what the Gauls were, they need rewards." His glorious victories are justified in the same way. Anything to secure his own power. If the French were vain and frivolous, was it the part of a great ruler to develop that side of the national character? But Napoleon would have debauched the moral principles of France; he would have destroyed freedom, that spirit of liberty which is the essence of natural life, and in return he would have given material prosperity. He quenched the liberty of the press, he put literature in leading-strings, he gagged the mouths and would have chained the thoughts of men if he could; but then in return he poured into the lap of France the spoils of Europe. He made roads and canals, regulated finance; in fact, the French were to give a lease of themselves and their property to this incomparable administrator, and he would make far more out of it than they could have done for themselves.

The fruits of such a bargain are bitter. Whether the end proposed be good or bad matters little; the nation or the individual who begins by giving up liberty ends by giving up all. Whatever vitiates freedom withdraws from the social and political atmosphere an element essential to life. We see this in the case of morals. It is a curious and instructive fact that your tyrant, whether he be a Pisistratus, an Augustus Cæsar, or a Napoleon, is a great stickler for good manners; and you will find that they are perpetually regulating public dress, public amusements, and public chastity; for the results ask Harmodius and Aristogeiton, Tacitus, and Juvenal, and—but perhaps you had better not —consult the secret memoirs of the First Empire. Running streams purify themselves, stagnant ponds fester and putrefy.

There is a method of catching trouts by tickling them. You begin at the tail and work upwards till the fingers can grip them firmly by the gills. Napoleon was an adept at this kind of work. "If the inhabitants of the country should be inclined for independence, you should flatter their taste, and should not fail in your proclamations to allude to Greece, Sparta, and Athens." These were his instructions to the general who was to take over Corfu in 1796. "It is no longer conquests that he plans," said Champagny for him to the Legislative Body, March 5th, 1806; "he has exhausted military glory; he no longer aspires to those bloody laurels which he has been forced to gather. To perfect the administration; to convert it into a source of lasting happiness and ever-increasing prosperity to his people, and by his acts to set them an example of pure and high morality; to merit the blessing of the present generation, and that of generations to come—such is the glory he aims at." Before the end of the year he had fought Jena, destroyed the Prussian monarchy, and by the Berlin decrees declared Britain in a state of blockade. At St. Helena it was a constant subject of regret with him that the ingratitude of Europe had cut short his career before he had been able to bestow upon France thoroughly liberal institutions.

He was also a proficient in the art of smearing with greasy eulogy, preliminary to deglutition. When anxious to win over the clergy, he delighted in contrasting the virtues of the Italian priests with the vices of the ancient clergy of France. "I have sometimes felt, in talking with these good men," he said, "as if we were back again in the first centuries

of the Church." Behind their backs the venerable prelates thus spoken of were simply "the black-coats" and "imbecile dotards." In 1802, during the short peace, Fox, fresh from the Westminster election, ran over to France, where he was introduced to Napoleon, who had just been elected Consul for life. We have an account of the interview from the pen of his private secretary :—

> Bonaparte, of a small and by no means commanding figure, dressed plainly, though richly, in the embroidered consular coat, without powder in his hair, looked like a private gentleman, indifferent as to dress, and devoid of all haughtiness in his air. . . . The English ambassador, after the presentation of some noblemen, announced to him Mr. Fox. He was a good deal flurried, and after indicating considerable emotion, very rapidly said, 'Ah, Mr. Fox! I have heard with pleasure of your arrival—I have desired much to see you—I have long admired in you the orator and friend of his country, who, in constantly raising his voice for peace, consulted that country's interests, those of Europe, and of the human race. The two great nations of Europe require peace; they have nothing to fear; they ought to understand and value another. In you, Mr. Fox, I see, with much satisfaction, that great statesman who recommended peace because there was no just object of war; who saw Europe desolated to no purpose, and who struggled for its relief."

Fox said nothing, but he may have thought to himself, in the words of his favourite Virgil, "Timeo Danaos et dona ferentes." Anyhow, Fox was not so simple as he looked, and the process of deglutition was not completed in his case.

Of Napoleon's powers of charming we have many examples. A good one is related by Mrs. Balcombe in her reminiscences of him at St. Helena. One day he met her and a Mrs. Stuart who was on her way back from Bombay to England. The Emperor conversed with her on the manners and customs of India, and on the inconveniences of a long voyage at sea, particularly to ladies. He alluded to Scotland, expatiated on the genius of Ossian, and congratulated Mrs. Stuart on the preservation of her clear Northern complexion. While the parties were thus engaged, some heavily-burdened slaves passed near to them. Mrs. Balcombe motioned them to make a détour, but Napoleon interposed, exclaiming, "Respect the burden, madam!" As he said this, the Scotch lady, who had been very eagerly scanning the features of Napoleon, whispered to her friend, "What a character, and what an expression of countenance! How different from the idea I had formed of him!" Here the process of deglutition was complete.

Napoleon's mind was essentially mathematical. He distinguished himself as a boy at the military college of Brienne in this subject, and all through life one of his favourite recreations was to solve geometrical and arithmetical problems. Indeed, this turn of mind worked him mischief, for he persisted in applying ideas of mathematical precision to subjects that scarcely admit of being so treated—to morals and politics. He was comparatively passionless, caring little for pleasure of any kind, or rather we should say that the passion of ambition consumed the others. It is curious to find him in a boyish essay on Love writing, "Love produces more of evil than good, and if a protecting divinity could deliver us from its influence, it would confer a benefit on humanity." Wit he had, but his intellect was of too positive a kind to admit of wit's gentler sister, humour. The nearest approach to it that we find is his remark to his brother when they were trying on the Imperial coronation robes, "Joseph, if our father saw us!"

Of how he could play the facetious let Madame de Rémusat give us an idea. Written by a dependent who had received much kindness both from the Emperor and his wife, it need not be suspected of being too kindly drawn—no man is a hero to his wife's lady-in-waiting.

> Fancy balls and even masked balls were given, and this was a new pleasure, and one which he tasted greedily. Some of his ministers, his sister, Murat, and the Prince of Neufchâtel were ordered to invite a vast number of people belonging both to the Court and to the town. The men wore dominoes, the women a pretty costume, and the pleasure of doing this was the only one which they could have brought to these gatherings, where every one knew that the Emperor would be present, and where the fear of meeting him kept them rather silent. As for him, masked up to the teeth, but not the less easy to be recognised, thanks to his peculiar gait, of which he could not divest himself, he walked to and fro in the rooms, generally leaning on the arm of Duroc. He attacked the women most vivaciously, observing very little decency in his discourse, and if he was in his turn attacked, without at once recognising the speaker, he would tear off the mask, and by this rude act of his power, show who he was. He had also great pleasure in making use of his disguise to go and torment certain husbands with anecdotes (true or false) about the conduct of their wives. It must be said of him, because it is true, that there is in Bonaparte a certain innate wickedness of nature which has a particular taste for evil, and that this shows itself in him in great things as well as in small.

No wonder that at times Talleyrand bewailed his master as "horribly ill-bred." "We ought to be allies," the great diplomatist said on one occasion to the Emperor Alexander. "You are a barbarous nation ruled by a civilised monarch; we, a civilised nation ruled by a savage."

Napoleon was fond of relating stories of ghosts, charnel-houses, and supernatural visitations. One of these stories has been preserved for us by Bourrienne, and shows that the great Emperor would have been a very respectable concocter of penny dreadfuls.

His comic productions were usually unintentional. They frequently took the form of proclamations and bulletins, which may have served their purpose, but which read curiously in the plain light of truth. A very comic performance was the medal purporting to have been struck in London to commemorate the annihilation of perfidious Albion. It is generally believed that he suffered a disastrous defeat at Acre, the grain of sand, as he himself said afterwards, that changed the destinies of the East. In his report to the Directory he explains that he had deliberately abstained from entering Acre because of the plague. All that was ever officially known by the French of Trafalgar till the downfall of the Empire was contained in an announcement of March 2, 1806: "Storms caused us to lose a few vessels, after a combat imprudently begun." He was a master of the "strategic retreat" style.

To Napoleon truth was a very secondary matter. When a proposal was made for the simultaneous

occupation of Malta by the English and of Taranto by the French, "It is important," he wrote, "that, if this arrangement does not succeed, Andréossy should make no communication that would leave evidence of it, in order that the Government may be able to deny that they ever adhered to this proposition." The noble art of diplomacy flourished in those days. Napoleon was only abler and more unscrupulous than those with whom he had to deal, English statesmen of course always excepted. As regards moral principle, they were all tarred with the same stick. It is amusing to witness the moral indignation of the Powers who had partitioned Poland when the parvenu, the ex-lieutenant in the regiment La Fère, took to playing the same game, only better. It was surely a want of delicacy in some other royal personages, when Napoleon, their creator, had fallen, to insist that he should be styled only General Bonaparte, while they retained the kingly titles which had been his gift. Napoleon truly said that he might just as well have been styled Archbishop Bonaparte, for he had been the head of the Church as well as of the Army.

There is a great deal in a name. It is often said in eulogies of the great man that he re-established Christianity in France. What he did was to establish a State Church with a priestly hierarchy, who formed really a kind of spiritual gendarmerie. Napoleon had, no doubt, better moods. He could lay his hand on the Gospels and bear his testimony to the truth of their message. "This was no man. I know men well, and Christ was no man." He could feel the strength of religious emotion at times. "The sound of the church bell of Rueil struck on my ears. I was moved." Shortly before his death he declared that he died as he was born, a Catholic. "I believe in God; I am of the religion of my fathers; every one cannot be an Atheist who pleases. I was born in the Catholic religion. I wish to fulfil the duties which it imposes, and to receive the succour which it administers." Every excuse must be made for the circumstances of Napoleon's early life—the pride, the poverty, the consciousness of incomparable ability, the assumed necessity of pushing his way at any cost and in spite of all obstacles, and the cant of irreligion which was the prevailing tone of the time; but, for all that, we must say that he was a queer kind of Christian. The Roman Catholic Church must admit, when he took to piety, his sanctity was a sore thing for the Church. His treatment of the Pope was a specimen of thoroughly heartless cruelty. With cynical indifference he fooled and bullied him by turns, if by any means his own purposes might be served. The Pope was brought to Paris to anoint the new Emperor of the French Republic, to bestow the *sacrosancta potestas* on the very man who not long before, in presence of the Directory and all the assembled bodies of State, had ranked religion with royalism and feudality among the prejudices which the French people had to conquer.

In Egypt Napoleon had declared himself a Mussulman. One of his proclamations to the Ulemas has been preserved: "Make the people understand that since the world was a world it was written that having destroyed the enemies of Islamism and beaten down the Cross, I should come from the furthest West to accomplish the task appointed for me." He had a great admiration for Mahomet, and he often lamented "the poverty of imagination in his contemporaries which prevented him from playing, like that great man, the double character of political and religious reformer." Religion with Napoleon was a part of statecraft, nothing more. A quotation from the State Catechism taught in schools, for this marvellous administrator neglected no detail, will prove this.

*Q.*—What are more especially our duties towards our Emperor Napoleon I.?

*A.*—We owe him especially love, respect, obedience, fidelity, and military service; we ought to pay the taxes ordained for the defence of the Empire and of his throne, and to offer up fervent prayers for his safety and the prosperity of his State.

*Q.*—Why are we bound to perform these duties towards our Emperor?

*A.*—Because God, by loading our Emperor with gifts, both in peace and in war, has established him our sovereign and his own image upon earth. In honouring and serving our Emperor thus, we are knowing and serving God himself.

. . . Those who fail in their duties towards our Emperor will render themselves worthy of eternal damnation.

Anything to attain his own private ends. The highest and the lowest motives are equally called into requisition. It is the same spirit which dictated a letter to the Minister of the Interior (February 17, 1806), in which he recommends a few bull-fights after the Spanish fashion, and some combats of wild beasts as amusements likely to please soldiers. He cares not how he degrades the instruments whom he uses. The army was Napoleon's chief instrument; he polished it most carefully. Never was any army more carefully organised or a more perfect instrument of destruction. There was one point to which he did not attend, or, if he did, it was to lower and not elevate. The moral tone of the armies of the Republic had been a high one. They had fought for an ideal, and had won victories without uniforms and without pay. Napoleon changed all that from the very first. He made war a profitable employment. He strikes the keynote of his future policy in his first proclamation to the army of Italy:

Soldiers! you are hungry and naked; the Republic owes you much, but she has not the means to pay her debts. I am come to lead you into the most fertile plains that the sun beholds. Rich provinces, opulent towns, all shall be at your disposal. There you will find glory, honour, and riches. Soldiers! with such a prospect before you, can you fail in courage and constancy?

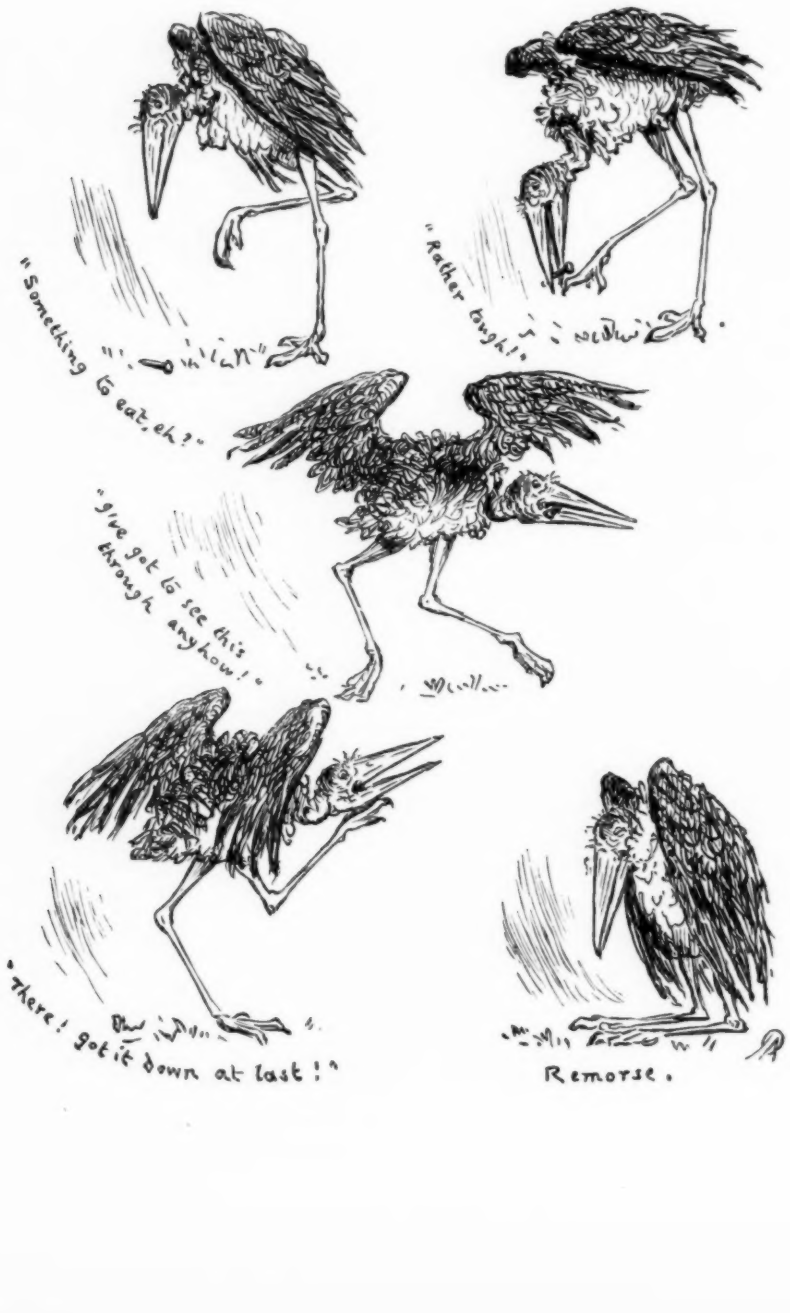
This principle was consistently carried out. His generals had dukedoms and principalities carved for them out of conquered territories; the soldiers lived on contributions levied on the foreigner. Their interests became distinct from those of their country. They were no longer the soldiers of France, they became bandits devoted to a leader. Fine fellows they were too. Here are the impressions of a competent judge who was in Brussels shortly after Waterloo:—

I have just returned from seeing the French wounded received in their hospital; and you could see them laid out naked, or almost so, one hundred in a row of low beds on

the ground. Though wounded, exhausted, beaten, you would still conclude with me that these were men capable of marching unopposed from the west of Europe to the east of Asia. Strong, thickset, hardy veterans, brave spirits and unsubdued, as they cast their wild glance upon you—their black eyes and brown cheeks finely contrasted with the fresh sheets—you would much admire their capacity of adaptation. These fellows are brought from the field after lying many days on the ground, many dying—many in the agony—many miserably racked with pain and spasms; and the next mimics his fellow, and gives it a tune, *Aha, vous chantez bien!* How they are wounded you will see in my notes. But I must not have you to lose the present impression on me of the formidable nature of these fellows as exemplars of the breed in France. It is a forced praise, for from all I have seen and all I have heard of their fierceness, cruelty, and blood-thirstiness, I cannot convey to you my detestation of this race of trained banditti. (*From a letter of Sir Charles Bell to his brother.*)

Such is the elevating effect of the pursuit of glory and grandeur! These are not the soldiers of Cromwell or Washington. Pity that such splendid material could not have been used in the service of civilisation and humanity. All this blood that an imperial crown might be fixed on the temples of an upstart! Blood the worst kind of glue!

Love too must be sacrificed. Poor Josephine! True daughter of France; fond of a ribbon, yet true to death. Thy Cid, thy Achilles must found a dynasty, must have for father-in-law an emperor, and thou must die, no amount of ribbons or choicest millinery able to fill the aching void. Napoleon, like other fatalists, was superstitious; he had his book of fate; he believed in omens, and it is said that one of the reasons for delaying Josephine's divorce was the feeling that his good fortune was dependent on hers. Be that as it may, the separation from his wife marked the unbounded domination of the evil principle in his mind—the final victory of selfishness. Josephine's influence had ever been exerted on the side of humanity. Weak she may have been, she was ever amiable. And Bonaparte reaped his reward. When his fortunes were broken, the Emperor's daughter returned to her father, and to him was no solace of wife and child. Josephine would have followed him to the death.



What a contrast between Napoleon the son-in-law of an emperor, and himself an anointed emperor, and the austere child of the Revolution. But he was no child of the Revolution. The Revolution made way for him. He sprang from the Revolution as sin burst from the teeming head of Satan. He is the incarnation of personal ability and a manifestation of the power a great individuality has to mould circumstances. In seeking the recognition of Popes and courting crowned heads, in trying to get into good old aristocratic society, he did not sin against the principles of the Revolution so much as against the principle of greatness in himself which ought to have made him reverence himself. After all, it turns out that this great conqueror, this child of nature, this genius above routine, must needs have a star for his breast and a crown for his head, and has to gain social standing by marrying an emperor's daughter. All the fine words liberty, equality, all the battles fought for the overthrow of tyrants, end in re-establishing a tinsel parody of the old régime. Principles of the Revolution, mere words, counters to catch fools!

Yet there was much good in the Revolution. Its aims were generally noble, if its methods were frequently bad. Grand ideals are never to be realised through cruelty and deceit. Evil must never be done that good may come. Men were in too great a hurry to force on the good time. The sword is not the instrument by which peace and goodwill are to be produced on earth. The tree of liberty was watered with blood, and its fruit still retains the flavour. The violent methods employed to attain a good are quoted as a precedent when the ends are evil. Hate breeds hate, cruelty begets cruelty, and unprincipled acts are retaliated by unprincipled acts. The instability of French institutions for a century past proves how unsound and slippery is the foundation that is laid in crime.

We have in our own English history two lessons in revolution. The aim of both was to secure civil and religious liberty. The first, worked out by pike and gun, culminated in despotism without lasting results. The second, attained by peaceful and strictly legal methods, has yielded principles which are still the palladium of English freedom. Bonaparte was fond of comparing himself to Cromwell. Both were embodiments of personal ability forced into commanding situations by stress of circumstance. If Cromwell was greater in moral force and self-restraint, Napoleon was greater as an intellectual machine. There was one lesson from the career of Cromwell which Napoleon did not draw. He did not see that, however great as a soldier and administrator a man may be, he must fail when he becomes untrue to himself and the cause of humanity. Success becomes an apple of Sodom that crumbles in the hand which grasps it for its own sake alone. The Revolution of 1688 produced no world-famous man, was not rich in great words or great situations—was, indeed, in many respects singularly commonplace; but it was permanent. That of 1789 was great in words, in deeds, and in men; but can we say that the Republic for which the French nation has bled and suffered is even now permanently established? Different might it have been for France and for Europe had Napoleon realised the truth that the greatest man is he who maketh himself least, in order that he may serve his fellow-creatures. Napoleon is one of our lost leaders. But the battle of humanity is a soldiers' battle. Courage, brother, we must conquer in the end!

Passages in the life of a Marabou Stork. Sketched at the Zoo.

# ON THE SCIENCE OF OLD AGE.

WE propose in this paper to consider generally the question of old age and longevity; to review its special physical and mental characteristics, and the diseases to which it is liable; then to consider the food, clothing, habits, and general care most suited to it; and, in conclusion, to point out those mental, moral, and spiritual qualities that should adorn our closing years.

### PRESENT LENGTH OF LIFE.

The whole journey of life is best divided into three stages: the period of ascent or youth (1–25); that of level ground or maturity (25–50); and that of descent or decline (50–75). Old age may set in anywhere along the last stage.

It must not, however, be supposed that the last stage necessarily ends at 75; for of late years especially, in many cases the period of old age has not *begun* until 80 years are past, life being prolonged over the century; while, on the other hand, all the signs of old age have been seen before twenty years have been reached.

There is no good ground for interpreting the Psalmist's poetical words respecting the age of man in his day as arbitrarily fixing its limit in all ages. The general statement there made still holds good; but none can doubt that it is being more frequently exceeded every day, as hygiene continues to lessen the number of premature deaths.

Out of every 1,000 people nearly 100 reach 75, 38 reach 85, and 2 reach 95. The number of persons in proportion to the whole population that reach 70 in Norway is $\frac{1}{3}$, in England nearly $\frac{1}{5}$, in France $\frac{1}{8}$, and in Ireland $\frac{1}{11}$. As far as can be calculated, the average length of life which is computed in the seventeenth century to average only 13 years, is in the eighteenth increased to 20, and in the nineteenth to 36. Men used to be considered old when they passed 50. Old John of Gaunt was 59, old Admiral Coligny but 53.

### VEGETABLE AND ANIMAL LONGEVITY.

It is interesting to compare the age of man with that of other parts of the organic kingdom. In the vegetable world it is enormously exceeded. Amongst trees, according to de Candolle's tables, the elm reaches an age of 335 years; the ivy 450; the chestnut 600; the olive 700; the cedar 800; the oak 1,500; the yew 2,800; while Humboldt computed the age of a baobab tree (a species of banyan) to be 5,700 years!

Amongst fish, Dr. Richardson finds no deaths from old age, and does not believe they have any term to their lives, save as they fall a prey to one another. Carp and other fish that have been isolated and watched are still living at enormous ages. As long as they live they increase in size. Even amongst the invertebrata we have a record of a sea anemone in Edinburgh of over 70 years of age; that belonged to Sir John Dalyell. Amongst animals we have an elephant of the reputed age of 1,007 years.

Coming to men, we find many remarkable instances of longevity. The long lists given by the old writers of very aged people (including one of over 300 years of age) have been proved to be most unreliable. Many cases, however, are beyond suspicion, and such unimpeachable centenarians as Sir Moses Montefiore silence all sceptics who doubt that human life can attain to three figures. Old Parr still remains as one of the most wonderful of these veterans. He was a poor farm servant, and, like Henry Jenkins (who was supposed to be 160 years old at death), led a hard and laborious life in a country village on scanty fare. At 120 Parr married a widow for his second wife, and at 130 could thresh corn. He died at 152, *but not of old age*. He had been sent for up to Court by the King; and the change to the rich and liberal diet proved too much for him. In all probability, had he remained at home he would have lived much longer, for Dr. Harvey (the discoverer of the circulation of the blood), who examined his body, found every organ in vigorous health, all the cartilages soft and flexible, and the cause of death solely his too liberal dietary.

### CLIMATE AND HABITS.

Longevity appears to depend to a certain extent on country and climate. While a cold, bracing climate like Norway gives a very high general average of age, the climate of Western Italy seems most favourable to very advanced life. As early as A.D. 76 we find that in this district in the Emperor's census 54 were returned at 100, 57 at 110, 2 at 125, 4 at 130, and 3 at 140. In Ireland, though the general average is low, we get many instances of centenarians. A country life is conducive to old age; while it is extremely rare to find persons of ninety years and upwards who have led sedentary town lives. Longevity cannot be said, however, to be dependent on any condition or vocation, but is found in the most opposed circumstances.

St. Anthony, who died at 105, ate a few ounces of bread soaked in water, never washed or changed his garments, and lived always alone in a desert. M. Chevreuil, the great French chemist, at nearly the same age, ate for breakfast two eggs, some chicken-pasty, and had a pint of café-au-lait daily; for dinner, tapioca soup with grated cheese, a cutlet, a bunch of grapes, cheese, and three glasses of water. No fish and no wine. He was scrupulously clean, and lived in or near Paris surrounded by his friends.

Some people survive in spite of their habits. One old man of 97 all his life drank quantities of *neat* gin, and smoked the strongest and rankest tobacco; while the Rev. W. Davis, who died in 1790 at 105, and who ought to have known better, for the last 35 years of his life never took exercise, and began the day on hot buttered rolls, and ended it with a supper of hot roast meat with

plenty of wine. Even a woman's tongue can be survived to a great age, for John Wakes, a centenarian, had had no less than ten wives. John Ross, again, and his wife are said to have celebrated their 148th wedding day, but this must be received with caution.

Spinsters will be pleased to know that single women live as long as married.

### CHARACTERISTICS OF SEX.

Sex influences old age. In 1873 out of 89 dying at or over 100 only 10 were males. This is due partly to less exposure to injuries, and partly to a greater tenacity of life. Girls die slower than boys; and though more boys than girls are born each year, this difference maintains the balance. We may notice one or two other points of comparison between the sexes, as observed in some hundreds of recorded cases lately collected. The average height of an old man over 80 is 5 ft. 6 in., of an old woman, 5 ft. 3 in.; the pulse rate in the man is 73, in the woman 78; the breath rate in the man 18, in the woman 22. The average number of teeth in the men is 6, in the women 3, while a fourth of the men and half the women had none at all.

### DURATION OF LIFE.

It is believed that there are traces in the animal kingdom of a law that fixes the extreme duration of life at five times that of growth. This latter period in man may be said to average 21 years; hence the full span of a perfectly healthy man's life should range from 100 to 105 years. As, however, none are born perfectly free from taint, the expectation of life varies greatly. Every human being starts on his life's journey with a certain life force —or, in other words, like a clock, he is constructed to run a certain time under given conditions. The duration of life may be approximately found by adding together the ages at death of the parents and four grandparents, and dividing by six. If the result be over 60, 1 year may be added for every 5; if under, 1 year subtracted in like manner. Most people, however, as we have said, die prematurely, so that few have the opportunity of seeing how long they might have lived. No reason is known why when a certain balance is reached, and maturity arrived at, it should not be maintained for ever, especially as our machinery is all self-repairing.

### CAUSES AFFECTING LONGEVITY.

The two chief requisites for attaining longevity appear to be

1. A sound quality of tissue, free from any inherent disease or weakness, and with an equally proportioned power of resistance.
2. Freedom from exposure to injury.

In 500 cases of people over 80, most came from long-lived families, enjoyed good homes, good appetites, and good digestions, were moderate or small eaters, consumed little alcohol or medicine, were good sleepers, and showed at death no trace of gout or rheumatic gout. Nevertheless, in 82 cases the near relatives were consumptive.

### SIGNS OF OLD AGE.

We will now consider one or two of the more prominent physical and mental characteristics of old age.

We find the changes from 50 to 100 go on as regularly and as surely as they did from 1 to 25, but in an inverse order, and more slowly. There is a steady lessening of material, of activity, and of strength. All three get less, though their relative proportions should remain the same.

The bones get lighter, and the muscles feebler, equally with the loss of desire for great activity. The weakened heart and arteries provide the less active circulation that old age requires.

The loss of appetite and teeth corresponds with the failure of digestive power. A healthy old age depends on all three—structural solidity, muscular force, and nervous energy—diminishing in the same ratio.

There is general wasting, and drying, and stiffening of all the tissues. The jaw wastes and returns to the infantile shape, while the skull thickens. The skin gets thinner, and the capillaries disappear; hence, we get loss of hair, and change in the colour of the skin. The tissues also degenerate. We get the *arcus senilis*, or the white ring, round the iris. There is a loss of elasticity in all the cartilages, as can easily be seen by pressing the breastbone to test its flexibility. A lean old age is best. Dr. Southey gives as a sign of old age: "A man looking back frequently as he walks along, turning his feet out, and treading on the whole base of his feet." He says a shoemaker can often guess the age of his customer from the way the soles of his boots are worn.

Many of the aged have very keen faculties. As the brain reaches its maturity and continues to develop much later than the body, so its powers are often at the maximum when the rest of the frame is wasting, the judgment is often keen, and the talent brilliant. Titian was painting a large fresco when he was cut off by the plague at 99. On the other hand, the memory is often defective. In a child the interest in his surroundings is the marked feature; in the aged it is frequently absent.

During the whole of life we gradually get more and more automatic in all our actions, as they become habits. At first all the actions of life were controlled by direct exercise of will-power: at the last but few remain so. We have within us two lives: the vegetative function of digestion, assimilation, and storage of food or force; and the animal, or the spending of it in nervous or muscular energy. As old age creeps on, the animal life gradually ceases, the actions unnecessary to life get fewer and fewer, and the man retires more and more within himself. He gets isolated and shut out bit by bit from all his surroundings, and taken up entirely with his own interests.

This is beneficial in part, as his hold on things around is thus gently loosened, each tie broken little by little, so that he suffers less when the final severance comes. Towards the close little but a vegetative automaton remains, and thus in those who really die of old age the launching into eternity is very gentle at the last.

### OLD AGE AND DISEASE.

Old age has its special dangers and its special safety with regard to disease. For instance, whereas in a child the temperature goes up on the slightest provocation, in old age it can hardly be moved at all. The aged body is not, as a rule, prone to any acute disease. If a person passes 80, it is rare for him to be seized with any special malady. In injuries such as fractures, though from the lightness and brittleness of the bones they are easily met with, they are repaired solidly and quickly, even in centenarians. Slight shocks cause severe depression, but greater injuries are surmounted, and surprising recoveries made from severe maladies. Wounds and ulcers often heal quicker than in the young; the aged recover from attacks of congestion, paralysis, apoplexy, pneumonia, erysipelas, and other affections in a surprising way. Diseases, as we have said, often pass them by. A man may live to 100 in a house in which he had typhoid fever himself, and in which many of his children and grandchildren have since died from it.

It is probable these favourable results are due to the long time the organs have worked unitedly and helped each other, like old soldiers who pull well together and bear reverses under which younger troops would succumb. There is, on the other hand, a tendency in old age for slight diseases to become chronic.

### CARE OF OLD AGE.—FOOD.

Now as to the care of old age, the chief points are moderate and digestible food, sufficient warmth, and an even, quiet life. The chief of the three is the food, or fuel for the lamp of life. While all fixed dieting is bad, where it can possibly be avoided, a few hints can be given that may prove of value The older a person is after 50, the less food he requires. Luigi Cornaro, who lived to 100, though of a feeble constitution, took 12 ounces of solid food and 14 ounces of fluid daily during the latter part of his life; and his most severe illness was caused by his increasing his allowance, through the continual entreaties of his friends. Very little proteid or animal food is required, and though in many respects false teeth are a great boon to the aged, they may lead to too great a consumption of animal food. It is not the amount of coals we put in a grate that warms the room, but the amount that can be burnt; and the great point is to avoid choking the digestive and excretory organs with excess of food. The food of the nursery is the best in old age. Bread and milk and honey is a capital diet. Milk agrees with nearly all. Hot milk with a little Mellin's food forms an admirable drink at night, and can be kept warm in a hot-water jug covered with a cosy. Fruit is wholesome if ripe or well cooked. Fat is good, as cream or fresh butter. Warm food is very suitable. Soup enriched with cream or marrow is light and nourishing. All meals should be regular, and all excesses avoided. Of 800 persons over 80, 60 per cent. were moderate eaters, 30 per cent. small, and only 10 per cent. large. If weight is being gained the diet should be decreased. In addition to the after-dinner nap as years creep on, a doze after breakfast and before dinner is often helpful.

### CLOTHING AND WARMTH.

As to clothing, it should be both warm and light. Fur is an admirable material. The underclothing should be of wool. A sealskin waistcoat is useful, and the feet and hands should be well and warmly clothed. An eider-down quilt on the bed, which should be warmed in winter, is a good covering. No aged person should be suffered to get cold in bed. 2 A.M. is the hour when most deaths take place, when the temperature of the body is lowest and its powers feeblest. The warmth of the bed is of great importance in old age. We are all expected to warm our beds, but old people cannot always do it, so it must be warmed for them. A bath (warm) should be taken every day, and a warmer bath, with plenty of a pure mild soap to keep the skin supple and soft, should be used twice a week. It is better for old people, who have the opportunity, to winter in the south of Europe, if possible. If not, the aged should shut themselves up in a well-warmed house at this season. All habits of old people should be respected, and not lightly altered.

Whatever excites exhaustion should be forbidden. Early rising is therefore bad. Drinking hard water is not good, as it tends to hasten the calcareous changes in the body.

### COMMON ERRORS.

Certain common errors in the care of the aged may be here pointed out: some we have already touched on.

1. That the aged require rich and very nourishing diet.
2. That early rising is good for them.
3. That cold baths invigorate them: whereas they are fraught with imminent danger, and are often fatal.
4. That continual medicines and dinner pills are needed to digest the food: whereas, instead, less should be eaten.
5. That the rooms should be hot: whereas they should be cool, but not cold—65° to 70°.
6. That a fixed diet should be rigidly adhered to: whereas variety is often essential.

Old age is, as we have said, of two sorts: that which is natural, and that which is prematurely acquired in youth; and it need hardly be observed that it is only of the former variety we now speak.

### CARE PROLONGS LIFE.

Self-denial often requires to be practised by the aged in many ways, though not arbitrarily. All known weak points in the constitution should be jealously watched. No care as a rule surrounds the aged such as guards the young, because they are not in many ways the same objects of interest. But this is not as it should be, nor is it consistent with the Christian profession.

In animals death when it comes is, as a rule, swift. There is, with the vast majority, no old age

and debility suffered amongst them. No long wasting or disease, or slow tumours, embitter their lives; they are killed by their fellows when their powers fail, and are thus delivered from all these slow tortures by one sharp stroke. This apparent cruelty of nature is thus a merciful provision for those beings who know not the meaning of sympathy.

In early ages and in savage life it was the same with man. The skulls found in the gravel beds are all full of teeth, as of those who died early. Now, in advanced civilisation, love and care prolong life to a great age. This is not an unmixed good. Almost the very existence of slow decay and long disease has been brought about by the love and care that distinguish humanity. Hence, it is a peculiarly noble and Christian work to lessen the sufferings that in a sense our own care has made possible; and, as far as we are able, to make old age a period of serene sunshine, and an unmixed blessing.

### DEATH IN OLD AGE EASY.

Death in old age is robbed of most of its terrors. The candle often goes out with hardly a flicker. The old man is happy and comfortable one day, and gone the next. Even amongst the aged, however, death from old age is not the rule. An organ generally fails long in advance of the rest, and the end is often sudden. A man may, like Dr. Willis, at 90, the attendant to George III., go to sleep in his chair and never wake. Or a slight cold, or indigestion, or over-fatigue, even a fit of laughing, or choking, or coughing, may bring about death in a manner much to be envied by those who have to travel by longer and more painful roads to the same end. A cattle-dealer at 98 attended the market on Saturday. Here he laughed and talked too much, and the excitement caused his death on the Tuesday. At 94 a lady walked a quarter of a mile to church, there caught a cold, and died that night.

The signs of suffering are painful only to the bystanders. It is rare to find a clear intellect at death. Nevertheless, that instinct is true that treasures up last words and dying sayings: for in the darkened mind only the strongest and most vivid ideas and expressions are left to find utterance, and hence often throw an unexpected light upon the real character. Hence the saying, "the ruling passion strong in death."

It is found that out of 800 aged people the most were naturally of a placid disposition; one-half were comfortably off, and only 4 had bad digestions. Three-fourths of the whole were of average mental power, while 11 per cent. were of low intelligence.

It is calculated that 425 out of every million are really distinguished men. Comparatively few of these live to a great age, though there are notable exceptions to this general rule, while real geniuses almost always die young. Fierce and rapid combustion of nervous or muscular force is not compatible with long duration of life. For long endurance in men, as in stoves we must have slow, steady combustion.

### CLERGYMEN AND MINISTERS.

Amongst occupations, the ranks of the clergy stand pre-eminent for longevity. Next in order come Dissenting ministers. The causes of this are obvious and interesting. In the first place a clergyman is such, as a rule, by a process of natural selection. It is not unlikely he comes of a pious family, and one therefore shielded from many excesses. In the second, it is generally the more placid average dispositions that enter the ministry, the more active and fiery characters drifting off into the army, or politics, or some more active occupation. Next, the influence of quiet literary work is most beneficial, while the mere hygienic value of the real possession of true religion, "a mind at peace with God," is very high. The possession of an assured though moderate income is also helpful, as is the regular and arduous—though not, as a rule, too exhausting—round of daily work. All these causes result in longevity. The same obtains, though to a less degree, among Dissenting ministers. In these, selection from a good and long-lived stock is not so common. The surroundings in many ways are not so academical, and even the income is frequently not so assured. Nevertheless, they only come slightly behind their brethren, and far outreach all other professions. Those, however, whose lot in life's brief struggle is cast in a more active sphere, and amidst more anxious cares, need not regret the comparative shortness of their years, so that they are spent to the best, and to the glory of God; for, as Bailey so nobly says—

"Life's more than health and the quick round of blood,
'Tis a great spirit, and a loving heart.
. . . . . .
We live in deeds, not years; in thoughts, not breaths;
In feelings, not in figures on a dial.
We should count time by heart-throbs. He lives most
Who thinks most, feels the noblest, acts the best."

### REQUISITES FOR OLD AGE.

An easy conscience, a merry heart, and a contented mind are three requisites for old age, and they are the assured possessions and birthright of true Christians. The conscience, calm in the Divine assurance of sin forgiven; the heart rejoicing in His love and in the luxury of shedding the sunshine, or rather the reflection of that unselfish love, on all around; and the mind not only contented, but overfilled with the contemplation of the glories "behind the veil," so soon and softly to be lifted. It may be contended that such a picture does not describe the average aged Christian. Possibly not; but is there anything incongruous or exaggerated in it? No! the incongruity is in ourselves, who live so far below the privileges, the joys, and the peace that are the rightful possessions of all who know the meaning of real personal religion. Listen to that master singer whose voice was not long since hushed on earth:

"Grow old along with me!
The best is yet to be
The last of life, from which the first was made:
Our times are in His hand
Who saith, 'A whole I planned,
Youth shows but half; trust God; see all, nor be afraid.'"

It is pleasing to note that amongst the 800 to

whom we have so frequently referred, selected from all classes of society, one of the most interesting and cheering facts observed is not only how frequently persons attain to the age of 100, but that those who do so are commonly cheerful and happy, without malady, enjoying the evening shade of life and the tranquillity that accompanies it; and that they, in most instances, pass away in perfect calm, without a struggle, realising in a remarkable way the words of Dr. Elliotson:

"Thy thoughts and feelings shall not die,
Nor leave thee, when gray hairs are nigh,
A melancholy slave!
But an old age serene and bright,
And lovely as a Lapland night,
Shall lead thee to thy grave."

Unfortunately this idyllic close is not always realised. The old man is sometimes querulous, cross, selfish, repining, hard to please, and hard to live with. "*Peu de gens*," said a famous Frenchman, "*savent être vieux*." Let us then, in closing, note a little more closely some few of the characteristics of a typical old age, and then consider how best they are to be attained.

### A SECOND CHILDHOOD.

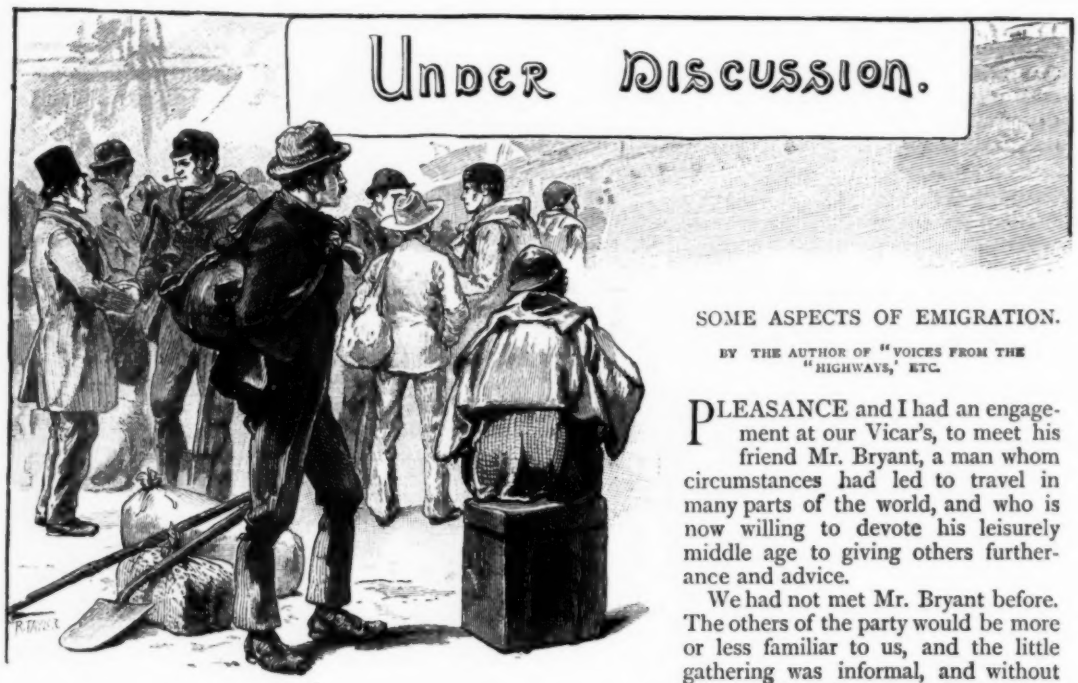
Old age should in many respects be truly a second childhood. The phrase is often used opprobriously to express the garrulity and foolishness that often mark both our exits and our entrances on life's stage. But childhood has another side, that may be beautifully reproduced. Its trustfulness, its freedom from care or worry, its confiding love, its serene brow, its ready smile, are all lovely in old age: combined as they then are with the wisdom of a lifetime. The exhortation of our Lord to His disciples, "Be ye wise as serpents, harmless as doves," seems perhaps most easy to obey in old age. The experience amassed may be helpfully and earnestly used in wise and loving counsel, and the veteran thus become the trusted guide of the house. The intellect is often bright and clear, as we have seen, in very advanced life. In fact, as the emotional nature decreases, the intellectual often increases, and judgment and the calm light of reason take largely the place of impulse and the dictates of the affections.

In a minority the reverse obtains, and the old man seems too largely emotional—easily moved to smiles or tears, and too little intelligent. An old age cannot be considered typical where love and reason are not alike conspicuous.

### SELFISHNESS IN OLD AGE.

The special and inherent danger of old age is selfishness, and it is this that most frequently disfigures it. The old man naturally gets more and more abstracted from surrounding objects and interests, and absorbed in himself, and thus, as he becomes more isolated, he becomes increasingly selfish. He thinks he has done his share for others: it is now their turn to think of him. This may be true, but is not the way to live in sunshine. Continue, dear aged friend, to think of and care for others in their little daily wants as well as in their greater interests. It will be all the more appreciated in you because it is rare, and the love you will create in return will make you very happy. You will not need repayment, though you will get it, for the pleasure of unselfish love is its own reward.

Try and keep up your interest in the life around you, and resist as long as you are able the rôle of a solitary unit. There is no more important point than this in prolonging life—the maintenance of an active connection with our environment. Old age has a natural affinity for youth, and young life around is a safe tonic. Many an old man has thus had an Indian summer added to his days by the presence and love of the young. If only to attract these, therefore, it is worth while being lovable; and to be loved, one must love. Old people often lament that they have ceased to be useful; but in this they may be mistaken. No one knows the measure of his influence, or what lessons may be conveyed by the cheerful acceptance of his lot.



After all, there is nothing but Christianity that suits all ages, from the child at his mother's knee to the patriarch on his dying bed. A typical old age must be truly Christian, not alone in faith and doctrine, but in love and good works; and at no time through life does the heavenly light so illumine the thin walls of the earthly tabernacle as just before it is taken down and folded in the grave. But this serenity, this sunshine, can by no means be acquired in a moment. The foundations of a happy old age should be laid in early life.

The words that Tennyson in his "Œnone" puts into the mouth of the goddess of wisdom may well be pondered by those who would enjoy a peaceful old age:

"Self-reverence, self-knowledge, self-control,
These three alone lead life to sovereign power.
Yet not for power (power of herself
Would come uncalled for) but to live by law,
Acting the law we live by without fear;
And, because right is right, to follow right
Were wisdom in the scorn of consequence."

Self-reverence or respect is the true outcome of Christianity, and leads to respect and care for others; self-knowledge leads to humility and counting others more worthy than oneself; self-control is the chief law of health, physical, mental, or moral, and acquired early is its best safeguard through life, and a bright trait of old age. The habitual restraint of self-control is the highest form of self-culture; it gives, as nothing else can, true force of character, and preserves us later on, when our wills and powers are weak, from the unseemly exhibitions of violence, selfishness, and childishness, that are not uncommon in old people who have never practised this virtue in early years.

ALFRED SCHOFIELD, M.D.

## SOME ASPECTS OF EMIGRATION.

BY THE AUTHOR OF "VOICES FROM THE "HIGHWAYS,' ETC.

PLEASANCE and I had an engagement at our Vicar's, to meet his friend Mr. Bryant, a man whom circumstances had led to travel in many parts of the world, and who is now willing to devote his leisurely middle age to giving others furtherance and advice.

We had not met Mr. Bryant before. The others of the party would be more or less familiar to us, and the little gathering was informal, and without any definite aim stated beforehand. It is true a rumour had reached us that Mr. Bryant, in contemplating a visit to a colony already well known to him, was desirous of organising a party to accompany him, with a view to settlement there. It was not the first time he had done something of the kind, though it was whispered that if his present project could be carried out it would be on a larger scale than anything he had attempted heretofore.

A gentle hubbub of voices, a pleasant confusion of friendly faces, greeted us as we entered the Vicarage drawing-room. First to loom out of it was the countenance of Mrs. Davis, the doctor's widow, whose duty in life is to make the most of a narrow income, and the best of two or three troublesome boys. Next, I saw the strong kind face of Mr. Markby, the head-master of our Board school, and the humorous eyes and quaint garb of our friend Penelope Boughton, who had come up from the East End "slum" where, for Christ's sake, she lives side by side with drunkard, thief, and harlot, as other honest men and women are forced by dire necessity to do. Then there were a comfortable-looking lady and gentleman whose name I knew to be Price, country folks, staying at the Vicarage. There were two or three youngish men and women whose faces I had certainly seen at sundry parochial functions. And lastly, there was Mr. Bryant himself, with a touch of foreign travel in the bronzing of his brow, and the signs of a leader of men in the penetrating quality of his eye, and in that strength of chin which is not aggressive but massy.

As we came in Mr. Bryant was saying:

"The grand mistake that has prevailed about emigration is, that it has been generally regarded from one of two points—either as a means of making rapid fortune, or a way of escaping from past failure, moral or financial."

"But we can scarcely expect people to leave their own dear native land while it is possible or pleasant to remain there," remarked Miss Barwick, the Vicar's sister.

"I don't know that," said Mr. Bryant. "I think a time may come when people will ask themselves this question, 'Where can I make my life most useful and valuable? Where can I find the best outlet for my own special aptitudes?' And I do hope the day is not so very far off when many will understand that success in life means to secure a life worth living all along the line, and not a mere contemptible scraping up of gear to be presently scattered again, generally more or less contemptibly, either by ourselves or somebody else."

"I don't know that I quite agree with all you are saying, Mr. Bryant," said one of the general company, a lady, rather elaborately dressed. "For I do think that we educated and well-to-do people already feel it our duty to accept the trial of seeing some of our families depart for India, or China, or South America. It is the poor, whose life here is often mere misery, and who have everything to gain and nothing to lose by change, who always regard such a going away as a dreadful calamity, to be avoided

until they are fairly driven to it. I think that is such a proof of the unreasonableness of that class."

"Nay, madam," said Mr. Bryant, "I do not think the two cases are parallel. By the very countries you instance as the general resort of the sons of the rich, we see that they do not go there to stay, the climate rendering that impossible in most cases. Then they have at command the means of speedy return at any time. The places and peoples among whom they are going are already made familiar to their minds, and they usually go as part of great commercial or State organisations. They find a friendly circle prepared for them. Such people are, or ought to be, good letter-writers, and in expectation of good letters. The poor man, on the other hand, feels that his departure will be irrevocable; the possibilities of his return are so few or so remote that his farewells must be uttered as they are by death-beds. About the country of his choice he often knows little more than a few half-fabulous stories, and perhaps some bewildering statistics. Generally he goes alone, or with a helpless wife and children. Nobody gives him welcome but a busy, brusque emigration agent. Lonely he goes to his obscure work among strangers. He is a poor hand with the pen; sometimes it takes him no little effort to obtain ink, paper, and writing room. He can scarcely secure a safe and permanent address. What wonder if, amid all these difficulties and the many chances and changes of life, the mist between him and his old home finally settles into absolute darkness! Then the blank in which his history ends serves to discourage those who remain behind, and adds a new terror to the next going away."

"Ah," said Mr. Markby, "I have often thought it would be well if geography were taught in our Board schools in a more interesting and human way than it generally is. It is not knowledge of the length of rivers or the height of mountains which is wanted, but an acquaintance with the colonial or foreign ways of living and kinds of labour. Even differences of climate might be set forth in some fashion more intelligible to the unlearned than are mere readings of the thermometer."

"I understand," observed Miss Boughton, "that for the girls in our Board schools geography is not a compulsory subject. At any rate, on this point the ignorance of girls of the factory class cannot be exaggerated. I discovered that none who came to my sewing meetings even knew that the earth was round. They found the assertion quite incredible! They actually reasoned against it, with much the same arguments which met Copernicus and Galileo! I don't think they believe it yet. And one of the brightest plainly asserted that she 'had always thought the world was made in three storeys, and that we lived on the second floor!'"

"There!" said Mr. Bryant. "Now you see what courage, what enterprise, what strong blind faith are required before those who know so little can dare to leave what they do know!"

"I think it is not among the poor only that we find crass ignorance," observed Pleasance. "The niece of a celebrated British publisher lately informed me that, having been born in India, and afterwards brought to this country, she was taken when a child (not many years ago) to visit a lady who had known both her parents before they went abroad. She thought this person looked at her with unusual interest, which was presently explained by the remark, 'I am so glad to find you are not black, although you were born in Calcutta!'"

"I have heard people whom one must regard as educated—clergyman and other professional men—make extraordinary mistakes between South America and the Southern States of America," said Mr. Harvey.

"And the general confusion of ideas on these matters is shown in the coarse application of the term 'nigger' to races who enjoyed a high civilisation while we were still painting ourselves with woad and feeding on nuts," remarked one of the young men who had not spoken before.

"In this direction," said Mr. Bryant, "I think an immense amount of good might be done by popular lectures of the most informal nature possible, their real value being not literary but practical. Anybody who has had some opportunity of looking abroad into the world should be ready to tell others what he has seen and heard. Even if his opportunities for observation and opinion have been brief and poor, that does not signify much, so long as he honestly states what they were, and does not generalise too rashly upon them, like that gentleman who jotted down in his diary that Yankee drivers hold the whip in the left hand, because the man who drove him from the docks to his hotel chanced to be left-handed! Indeed, to the ignorant and inexperienced, a country is brought nearer by the mere sight of one who has been to it and returned in safety! If he can show them something he has brought thence, and some pictures of the places he saw, so much the better. He—or it may be she—should permit the audience to ask questions. If unable to answer such on the moment, still the lecturer may be able to advise where information can be got. I wish there was somebody in every parish, and especially in our rural parishes, who would make himself—or herself—locally known as a referee in such matters. No single person could be expected to give reliable information to every intending emigrant for every quarter. But any intelligent and educated person knows how he would seek such information for himself, and he might hold such knowledge at the service of the ignorant and helpless."

"Is there not some branch of Government which gives all information to emigrants—as far at least as our own colonies are concerned?" asked Mr. Harvey.

"Yes," answered Mr. Bryant. "Since 1886, the Emigrant's Information Office, in Broadway, Westminster, has been doing most useful work. Yet one can readily understand that official advice must be written on very wide lines, between which many individual counsels are necessary. For instance, suppose it to be broadly stated that carpenters are wanted in the North-West, in Manitoba or Alberta. Still that is no good reason for some sickly young workman, more skilled in making furniture than in knocking up log-houses, and quite

unfit for roughing it among all sorts of hardship, to imagine that *he* is wanted there. Or again, if it is prudently declared that women of the dress-making class are not encouraged to emigrate to Ontario, that does not belie private advices that there is a very good opening for a dressmaker in some special township. I think such local agencies, purely voluntary and disinterested, would be a most important branch of Christian helpfulness. In the most natural way they would further emigration on what I consider its soundest principle."

"How would you state that principle, sir?" asked Mr. Rice, with old-fashioned country courtesy.

"To be very brief, I should state it as the principle of association," answered Mr. Bryant. "Let me explain. Emigration is almost sure to run on lines of some kind. It has run on penal lines, when a nation has expelled reluctant criminals to lands fairer than its own. It has run on lines of excited cupidity, as in the great rush to gold-fields. But we may give other and more satisfactory examples. The Pilgrim Fathers, drawn together by their common faith and their common search for freedom, have made a national foundation-stone strong and shapely enough to give some form and coherence even to the heterogeneous rubble which has since been poured upon it. The flourishing Canadian province of Ontario was originally settled by people with the common bond of strong patriotic sentiment—to wit, those residents of the American States who resolved to adhere to British rule when the States formed themselves into a Republic. All over the Dominion we find districts which have been opened up and peopled mainly by masses of colonists coming together from their own country. To say nothing of the original Canadians, the French, who have preserved their religion, language, and all their national characteristics, I will only instance the Germans, who have many centres, from which they ramify widely; the Danes, who flourish in a tract of New Brunswick; and the Icelanders, who are now proving themselves valuable colonists in certain parts of the North-West. But it is only when new countries are very new, or when the pressure of political change bears very heavily on old countries, that mass emigration is likely or possible. Something of the sort has been accomplished in New Zealand by nuclei of Episcopalian, Presbyterian, or Independent colonists, who naturally create about themselves allied social conditions. But as the 'waste places' fill up and emigration becomes more complicated, what we should seek to secure are opportunities of safe and sympathetic surroundings for the individual emigrant. What better means than such a local agency as I have alluded to? There would soon be, as it were, a track made from your parish of St. Helen's" (he bowed to our Vicar) "or your village of Stagshaw" (he inclined towards Mr. Price). "You would know of 'places' where to send your girls direct. Your earlier emigrants would write back to tell you of 'openings' for your boys, one that would suit your sturdy young pickle, and another adapted to your shrewd plodder. You could get exact information about expense and routes and precise addresses of suitable boarding-houses. (I know by practical experience how much waste and worry there is from lack of such help.) There would be somebody ready to greet your emigrants with real welcome, because they would bring with them a waft of home, and 'news' of old faces and places."

"I can see how such a connection could work if it were once established," said Mr. Price. "But how is it to begin? Few emigrants have ever left Stagshaw, and I fear we have lost sight of those."

"A great many have left St. Helen's at different times," added the Vicar; "but I am afraid no record was kept of any of them. I agree with Mr. Price. I scarcely see how we are to begin."

"Every beginning of really good work must be small and slow," said Mr. Bryant, with his cheerful energy. "You know, if anything springs up in a single night—well—perhaps it may be good enough grass, but you may be quite sure it is not an oak! But I will suggest how a very satisfactory beginning can be made. You know I am anxious to organise a party to take to Canada. I want certain picked types of people to fill certain openings which I know exist there. I want three or four families—father, mother, and young people growing up—all to go together, and able to take the old grandmother along too, if she's willing. Every one of them must be able to do something (with their hands, mind), sufficiently well to earn bread by. I'm not going to take families whose heads have been bankrupt or are out of work. I'm on the look-out for people who are doing fairly well already, but who begin to feel a little pressed for elbow-room, or to notice that there isn't much outlook for their sons and daughters, that changes have come over their branch of commerce or industry which will tend to make its future not so prosperous as its past. And then I want some young people by themselves—none of your scapegraces, but strong, healthy young men and women, the kind who could push some sort of a way for themselves here, but who would rather make more room for the weaker by going apart, where they can go forward without trampling others down. I want young men and women who are longing to try their strength and mettle in doing some of that sort of hard work which makes the whole world softer! Perhaps I shall get two or three young men from you, Mr. Harvey, and some big boys and girls from you, Mr. Markby, and some families from this parish and from Mr. Price's village. Now this party won't settle down all in one place, because they are going to a country which is already settled in the main, and because the aptitude of some will keep them in a town, while that of others will send them into the country. But they'll be near each other, within visiting distance, we'll say. That means that none of them will drop out of sight. And when they see (as they're sure to see) other openings for other people, there should be somebody in this parish and yonder village to send out a fit supply. I maintain that what we have to aim at in emigration is the keeping up of Nature's usual arrangements, so as not to have all the old here and all the young there, all the men in one place and all the women in another, and the mass of mouths divided by oceans from the bulk of the food!"

"But don't you think it is a very dangerous experiment to take elderly people to a new country?" asked the Vicar. "Will they not always pine for what they have left behind?"

"Elderly people will be always in the minority among emigrants," returned Mr. Bryant. "Of course they should not emigrate alone, nor be taken out in the expectation that they will 'enterprise' or 'rough' it. In the 'expectation,' I say; yet in my opinion they will often do so quite unexpectedly. I have found many grandmothers with more 'grit' in them than in their granddaughters! But the element of age is most valuable in a new community. Without it, there is no dignity, no rest, no reverence. Yes, I own they may fret a little after what they have left behind, and their sons and daughters and young folks will have to cheer them, and try to get things something like what they remember. But had they stayed at home, do their sons and daughters think they would never have fretted after those who had left them alone there? Some of us are not so careful to spare fretting as to spare ourselves from seeing or hearing it!"

"I certainly think your plans may offer hope for me in some of my difficulties," said Mrs. Davis. "There is my second boy, Marcus, the best-tempered and most genial of all my flock, ready to help everybody, ready to do everything I tell him—except learn his lessons. He is ready enough to read books of adventure and natural history, and to try practical scientific experiments. But he simply loathes his grammars and such treatises. And therefore he is always in trouble and disgrace. The studious boys can't consort with him, and so he and other idlers get into scrapes together. And what is to be his future? I have interest and influence enough to have done something for him if he had inclined to one of the professions, or to the Civil Service. But I have sense to see that to try to turn him in these directions would but prolong the miserable defeats of his school-days, and end in some sad disaster. 'Send him abroad,' say sundry advisers. 'He's just the boy for a new country.' But one can hardly send a boy of fifteen or sixteen quite alone and unguarded into a strange place; and if he stays till he is nineteen or twenty, what is he to do in the meantime? Nothing, I fear, but mischief."

"I am afraid you are right, madam," said Mr. Bryant. "That is exactly what colonists will tell you of that class of emigrants; they seldom come out till too late, when all their boyish aptitudes are blunted by the loafing and dissipated habits bred by idleness. In short, they seldom 'come' out at all, but are finally 'sent out,' that they may be got rid of. I know one valuable colonial institution — an agricultural college — which often finds itself cruelly hampered by being most selfishly used by parents and guardians, as if its functions were those of a thrifty and safe boarding-house for budding dipsomaniacs and spendthrifts. And yet, as you say, how can parents with any sense of responsibility send forth younger lads if they cannot secure for them a near-at-hand counsellor and refuge?"

"Yet a great many have done well enough in such circumstances," said Mr. Price.

"Assuredly," returned Mr. Bryant. "But a great many may be very few in proportion to the failures. A friend of mine who has emigrated scores of lads says that he notices there is a certain percentage whom he feels sure could manage capitally for themselves if he dropped them down anywhere on their line of march. He says such aptitude is not absolutely connected with goodness or badness of character, nor yet greatly with any past training, but seems a sort of gift, an instinctive knowledge of how to live and to deal with men and circumstances. But Nature has not provided enough of these gifted beings to supply whole continents, which yet have to be peopled somehow. Besides, even where the result is not dead failure, there must be often the most cruel waste of faculty and happiness and of the little means which friends at home may be straining their resources to supply. Cases of salvage out of this stormy stress may best reveal what treasures must be buried in nameless graves, or lost to sight in ashamed wanderers who will not return to tell their tale. Let me give a few instances which I have come across personally. A young man presented himself in the office of a friend of mine, a Canadian banker, to ask some detail as to the transit of two or three hundred pounds from the old country. He seemed inexperienced and bewildered, and my friend entered into conversation with him. He was a young Englishman, a vicar's son, who had come out to Canada with a view to agricultural work. For this he had found himself quite unfit, and after getting one or two unsatisfactory situations in towns he purposed buying a grocery business that was announced for sale in a remote settlement. He had written home about it, and his father had promised to sell out some of his small savings and let him have the money, and he had come to my friend to ask how it was to be sent, and so on. My friend was interested in the lad, and began to make inquiries in his behalf. He found that the grocery business was a snare and delusion. Under his advice the boy wrote home that the money was not to be sent. In reply came an anxious, terrified epistle from the vicarage imploring the banker to send the youth home at once, and he should be repaid everything, while the parents would owe him a debt of endless gratitude. But the boy stoutly refused to return; he was not going back as a failure—as one who was not worth his salt even in a colony; he would do anything first! My friend was touched by his honest pride and simple earnestness; he made it possible for him to wait on Providence a little longer, and in a week or two a small post in one of the bank's country branches fell vacant. The lad was put into it, gratefully delighted at being just able to pay his way. He gave every satisfaction, and my friend's introduction secured him a few open doors in the little township. Presently his chief got a letter from another township saying that the Episcopal Church needed an organist, and was willing to offer a stipend, but it was necessarily too small to tempt anybody who had not other occupation and means. Now this lad played very well

on the organ. His chief remembered this, and suggested that he should exchange into the bank of the township where he could make this talent available. And there he is to this day, rising in his office ; while his stipend as organist is also rising with the growth and wealth of the church."

"What a pretty, happy little story!" said our Vicar's sister.

"I wonder that an English vicar should have dreamed of buying a grocery business, genuine or not, for his son," observed the lady who had been so severe on the poor for their reluctance to leave the home country. "But I suppose they do such things in the colonies."

"Yes," said Mr. Bryant ; "that is one reason why there is more hope of getting along there than at home. I believe many could do quite as well here if they would work and spare as they do out there. But surrounding influences are too strong for most of us to resist."

Pleasance and I exchanged glances. Amy Parker was in our thoughts.

"I can tell you another story—a variation on the last." Mr. Bryant resumed. "In this case, the hero called on myself. He was in the greatest distress. He had come out to Canada, well educated and well principled, but quite untrained and unapt in any of the callings which there stand wide open and ready for every comer. His little store of money had gradually wasted away, and his final misfortune was to be engaged, on what he had thought most promising terms, as manager and general factotum for a 'professor of music' who was travelling the country giving 'high-class entertainments.' After one or two 'performances' in the city where I was then living, this scamp decamped with the proceeds, leaving this hapless boy saddled with the hire of the hall and every other expense incurred. As he had not a dollar left, he was in absolute despair! It was one of those cases which I think might have easily ended in suicide. I gave him my best advice : I arranged to go with him to the indignant debtors, telling them the true state of the case, and throwing it on their mercy. They were not unreasonable or unkind. One or two accepted their loss, the others were willing to wait. Next, what was he to do that he might eat a piece of bread? 'What *can* you do?' I asked him. 'Tell me anything, however unlikely you may think it is to be profitable.' He pondered a moment, and then said, 'Well, sir, I used to be fond of drawing, and I got several prizes for excelling in freehand.' 'We will begin there,' said I. I got him a little work in this line ; his employer gave him board and house-room in return for what he could do. He soon showed he had talent and industry, and some spirit of enterprise. He made most attractive little sketches of houses to be sold, or of houses which people had proudly bought. He gave lessons in drawing. He did heaps upon heaps of Christmas cards. With the little emoluments acquired in these ways he got teaching in surveying, then work of that kind, which secured him a safe position and a fair salary. Meanwhile, he had found his true bent, and he kept up his art studies, cultivated both hand, eye, and mind, and now he is the favourite art-teacher in the University of the very city where he was once a discredited vagrant in danger of the gaol. Now, these two youths were saved from the gulf on whose brink they hung. But how many may sink! And these were saved by precisely the sort of friendly intervention with which I should like to surround all."

"I have always wondered," said Mr. Harvey, "that there are no organisations for the emigration of young people of the better class, such as already exist for the waifs and strays of our big cities. Then, on leaving school, lads could go abroad under proper protection, be placed out with due discrimination, supervised and provided with a centre to which to resort for counsel, or in case of ill-health or misfortune. I have thought that such organisations could be self-supporting, each case bearing its own particular expenses and its proportionate share of the general expense. But I am sure it would be an economy in the highest sense of the word. Think of the money which must now be wasted for no return but failure and distress! I see, however, that your scheme of local and friendly settlement would be a better plan than any wider, and therefore vaguer, organisation."

"Possibly so," said Mr. Bryant, "but it may not therefore wholly supersede your idea. Your scheme might take up cases that somehow eluded mine. It will be a long while ere many parishes or localities are at work as I suggest."

"What do you think about farm pupils paying premiums?" asked anxious Mrs. Davies. "I have wondered whether that arrangement might suit Marcus. But really one has heard such horrors about it lately that one is frightened!"

"Well, madam," said Mr. Bryant, "I will not rashly condemn such arrangements. Doubtless many are honest enough, and probably many prove quite satisfactory. But youths for whom such premiums have been paid have told me that they could have done quite as well without the outlay. You see the plan works in this way. A lad will only learn farming by farming, and, if he is at all suited to the life, he cannot fail in Canada at least to make himself quite worth his board and lodging, and you have simply paid the farmer for his profitable use of a valuable labourer! On the other hand, honourable people who have received such a premium rather shrink from setting the pupil to the more disagreeable details of those labours which he should master at every point. A premium may secure a youth from unnecessary boorishness and coarseness, but, on the other hand, it may introduce him to sport rather than to agriculture. On my last journey home I travelled with a young gentleman, the nephew of an English baronet, who informed me that he had lived as a farm-pupil for three years—and had learned absolutely nothing. But he had had 'a jolly time.' Such a scheme as I suggest or as Mr. Harvey proposes would obviate these dangers on either hand, and save the premium into the bargain."

"But the worst of it is," mused Mr. Price, "that so many of the people who go abroad are difficult cases. They go as a last chance, and one hopes the best for them, but one would scarcely like to

send them among friends or to give them letters of introduction. Sometimes one is not sorry to hear no more about them, assured that, at least, they cannot be doing worse or sinking lower than they were at home."

"But, my dear sir, that ought not to be," cried Mr. Bryant. "The colonies don't want your failures. And to send them there is as dishonourable as it would be to send children suffering from infectious diseases into the healthy houses of unsuspecting neighbours. You may send us (provided you do it in time) those who would become failures with you because you don't know how to use them or have not the means of doing so. But those who have once contracted bad habits of any sort should pass through some moral quarantine among yourselves before you send them to us. You say they profess to repent and desire a new beginning. If you believe in their penitence, why should you hesitate to let them prove it to you before you part from them? When you feel they are fit to stay at home, they will be fit to go elsewhere."

"But some cases, from their very nature, preclude even a profession of repentance," said the Vicar. "There is simply sin, remorse, shame, and flight. Would you hold out no hope to these?"

From his tone, I think the memory of some such tragic history was astir in his kind heart.

"I withhold hope from none, sir," returned Mr. Bryant. "Leave such cases to come to us of their own will, and with only such means as they themselves can command, and in nine cases out of ten the hard realities will prove the very discipline they need. What we ask is not that these shall not come, but that you will not send us a stream of pampered profligacy or a flood of pauperised inertia."

"Oh, my poor, poor people!" sighed the Vicar. "It does not seem all their own fault that the energy and spirit of independence have gone out of them, so that nobody wants them anywhere. I feel that poor living in poisoned air for two or three generations would take these virtues out of any of us."

"Nobody can pity them more than I do," said Mr. Bryant. "And I want to see them helped. I want to see you British folk so change your ways of living that, instead of constantly driving and drawing your fine farm labourers and fisher folk off their fields and shores into your huge cities (as you have been doing for years past), you will help them to see that they can do best for themselves and their children by coming straight to our fields and our shores. Then, as they leave empty places, I want to see you leading your crowded-up townfolk out once more to your own fields and shores."

"What do you think about female emigration?" inquired one of the ladies. "There is such a troublesome excess of women in this country."

Mr. Bryant smiled rather significantly. "I find," said he, "that the woman who is wanted everywhere is the woman who is able and willing to do domestic work. From what I hear, I don't think that woman is a drug in Great Britain. The question is, Does she prefer to work for master and mistress with you, or for husband, brothers, and sons with us? If we can tempt her away from you, I can assure you she will find a welcome."

"That is such a utilitarian view of the matter!" answered the lady, with a hurt tone. "Do you set no store on a woman's social influence?"

"Indeed we do," returned Mr. Bryant. "But we think that influence, like every kind of power, is an appanage of activity in some useful sphere. If woman is to be a guardian angel, it must be by becoming a ministering spirit."

"I believe female emigration is a very difficult work to carry on," said the Vicar's sister.

"Truly," said Mr. Bryant, with his gravest look. "It is on that very score that I am such an advocate for family emigration. For the family tie is strong enough to draw out worthy women, who, otherwise, still finding occupation in the old country, are slow to think of quitting it and apt to leave the ranks of female emigration to be supplied by those less worthy, who cannot so easily range themselves, or on whose characters a blight has already fastened. For this weak and facile type of woman the life on shipboard, brief as it now is, is often a long slide on the downward path; and when such find that work is as stringent in a colony as it is at home, and harder and rougher beside, all their false hopes and visions are dispelled, and they become the most rampant source of social corruption."

At this point Pleasance spoke.

"Sir," said she, "from your experience would you recommend emigration to a young woman, well brought up, and of good disposition, who has had surroundings of an enervating nature, and has fallen into follies—not sins—through which she has been wounded to the quick, so that now she cannot touch her old life at any point without writhing. Is such anguish wholly disciplinary, and therefore to be endured? Or is there a point at which she may lawfully seek for the alleviations that a total change of surroundings may offer?"

Mr. Bryant considered. "I would not advise her to make such a change in rash haste," he said. "I would uphold her courage by suggesting that at worst it always remains to be made, if she and life cannot become otherwise reconciled. And then if they do, as I think they will, such a change would be likely to be most satisfactory. For she would go forth, not as a fugitive from pain, but as a conqueror, bearing rich spoils of self-discipline and self-control. We don't want to forget our follies, do we? We want to get them transmuted into wisdom. So I think after any of life's great experiences we should not be in too much haste to sip any water of Lethe. There is no doubt that change of surrounding does blunt the edge of memory. But there is certain loss as well as possible gain in the proceeding. It is better to conciliate or conquer any foe on the battle-field than to fly from him and meet him again at some unexpected corner."

"I think I have got the right word for Amy," said Pleasance, as we two walked home together. "Oh, what a blessing it would be if we could make some 'straight path' between 'supply and demand' in matters of help and consolation and wisdom!"

"There is, indeed, ample scope for enterprise and energy in attacking the jungle depths of Darkest England," said I, very soberly.

# "YANKEE DODGES."

## STREETS AND HOUSES—HOTELS AND RESTAURANTS.

MANY of the peculiar features of New York—those which at once impress a stranger—are due to easily discoverable causes. Indeed, there is a reason, and a good one, for everything novel and strange one sees; for, as before remarked, the American yields little deference to history or custom, but makes everything to suit his present circumstances and requirements.

The value of the land in the city has led the owners thereof to make as much out of it as possible by building high. Thirteen or fourteen storey houses are common, and the streets being narrow a glimpse of sunshine on the pavement is rare—a benefit in summer when the heat is excessive.

Wood is cheap, and being much used in construction renders the buildings very inflammable, and this fact, coupled with their height, causes them to bloom all down the front with projecting iron "fire" balconies connected by ladders, for the protection of the tenants. In many hotels every room is furnished with a rope fire-escape, while the fire services and brigades of American towns are the finest in the world.

With regard to the state of the streets before alluded to, and which is certainly a striking feature in an otherwise civilised city, it is a moot point whether the good elevated roads and horse-cars have caused the bad pavements, or *vice versâ*. This

The height of the buildings has led to the universal adoption of the elevator, and from almost every roof there issues a jet of steam from the elevator engine.

The city viewed from an eminence such as the top of the Produce Exchange Tower presents a remarkable appearance. The atmosphere is singularly clear, and there is no smoke, as hard smokeless coal is invariably used. So pure is the air, indeed, that the flat roofs of the city are used for clothes-drying, and as far as the eye can reach, there is a general fluttering of white, mingled with countless jets of steam. Surely there is no other city in the world as large and busy as New York, over which one can get a view of ten miles.

The tropical summer heat compels the use of sun shutters, which fold back on either side of the windows in winter, and are generally painted green.

is unknown to the common people; an alderman might supply the information.

Sidewalks (*i.e.* pavements) and roadway are alike bad; and a visitor, after kicking the soles off a few pairs of boots, instinctively acquires a fine high-stepping action in order to avoid the raised joints of the paving-stones—the New Yorker knows better than to walk in his streets at all, and always rides.

Another encouragement to pedestrianism, at all events in the business or "down town" end of the town, is the fact that, owing to scarcity of land and absence of side-lanes or yards, all goods are loaded from the pavement. Every warehouse or store has a lift which "dumps" the packing-cases down on to a narrow raised part of the sidewalk, which runs along the front of each building. Thence they descend on to the sidewalk itself, or, worse still, are wheeled or rolled along a movable plank right on

to the carts which line the street. One comes across a plank—literally sometimes—about every dozen yards on a busy day, and as they are about two feet above the pavement, they form quite interesting obstacles. New York rears some of the finest hurdle racers in the world. The planks are not so bad, and may be negotiated by walking round or jumping over them; but the unpleasant thing is to have a big sugar-cask suddenly wheeled hard into you, while in mid-air over the plank, by a sweetly smiling negro. Old ladies seldom walk in the business quarters of New York.

Occasionally in some streets, owing to scarcity of planks or extreme weight of goods, a waggoner calmly backs his cart right over the pavement. The people most good-naturedly walk in the mud round the horses' heads, although they are all in a dreadful hurry to "get there."

The New York carts are specially constructed to facilitate loading from the sidewalk, being built with a sloping deck. Large wheels and good springs are a desideratum, so that the floor of the cart could not be made low all along, and therefore it is sloped at the tail end. Many of the carts have no sides, but are provided with several loose uprights or "rungs," as they are called, which fit into holes in the floor. By this means the waggoner can practically adjust the size of his cart to the load it has to carry.

Coal is shot in an ingenious way, but with a total disregard of the wayfaring man. A sloping iron shoot is projected from the back of the cart, which latter is provided with tilting gear. The man turns a handle, the cart tilts up little by little, and the coal rattles down the shoot into the hole in the pavement with great rapidity and a rattle like unto musketry.

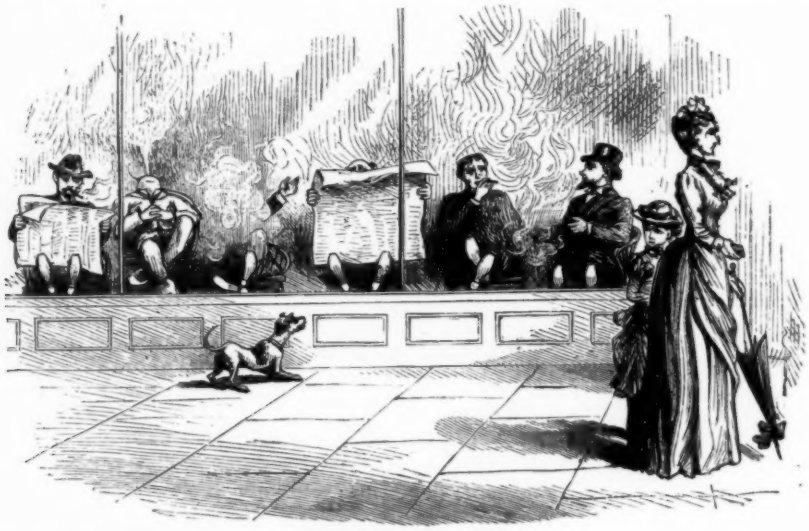
The English method of buying coal in sacks, which sacks when emptied are carefully counted by the thrifty householder, is not used in New York, where the coal comes loose in the cart. On second thoughts the emptying of these sacks is a much more barbarous method, and one more detrimental to passers by, than the American shoot dodge.

The portable dustbin is a great institution in New York, and as soon as evening's shadows fall makes its appearance in great numbers all along the sidewalk. Carts come round during the night, and the bins are emptied and replaced—with more or less accuracy—on the kerb. When full, they serve as cheap restaurants for the cats, and whether full or empty form admirable deterrents to inebriety. The New York tippler has other obstacles in his homeward path than the latchkey-hole.

The general appearance of all but the finest streets is not good, owing to the height of the buildings, the number and variety of excrescences in the shape of fire ladders and balconies and trade signs, the packing-cases before alluded to, and the electric wires. These last are numbered by thousands—electric light, telegraph, telephone, and fire-call wires are all strung up on to wooden posts usually out of "plumb." The light wires are a great source of danger, owing to the strength of the currents passing through them. Many linesmen have been killed while working on the poles, and a wire occasionally breaks, and the ends fall and kill or injure some one. The dreadful accounts published in the newspapers some time ago were not at all exaggerated.

There has lately been a great agitation, however, about the matter, and subways are being constructed to take all the wires under the streets, so that the worst blot on New York scenery will be removed.

The trade sign-boards of the various stores which project from the fronts of the buildings are a notable feature. They would be all very well, were there only a few, but they are so numerous and close together as to hide each other to a large extent. Only the one at the corner of each block is much noticed, and each of the others flashes out momentarily from behind the preceding one, as one passes along, like a figure in a wheel of life. It is a head-aching business to find any store of which you do not know the number, for it is impossible to cast the eye over the name boards of six or eight successive shops, as one can do in an English town.



But if the New Yorker tolerates some things in his streets which would seem unbearable to us, in all that regards his personal comfort he is an epicure. The street and sideway blockade is not his own personal concern—besides, he wants to "dump" his own goods on his own pavement—but his travelling, eating, drinking, shaving, bootblacking, and the rest are luxurious.

He never shaves himself, but spends fifteen or twenty minutes and twenty-five cents (and upwards) every day at the barber's. The shops of these functionaries are as plentiful as are tobacconists' at home, and every hotel has its own as well. They are seldom empty, and the processes carried on therein are many and various. The chairs are so comfortable, and the operators so skilful, that patients frequently fall asleep under the ordeal, and indeed an American only looks thoroughly placid and restful while being shaved; and in this case there is, after all, more or less of compulsion or necessity.

Then it is worth something (five cents, or twopence-halfpenny in fact) to have your boots blacked in New York. No balancing on one foot and striving by dint of great muscular exertion to keep the other—which has no weight upon it—in due position on the "block" while the operator exercises his calling. The blackee is a victim or patient commonly in England, and retires from the ordeal with a sense of discomfort and humiliation which not even the brilliance of his boots can dissipate. In America, as sometimes here, he regards things in general from the depths of a lofty easy-chair throne, rests his feet on classically moulded supports cunningly made in cast-iron to represent horses, camels, etc., while the attendant European or negro (rarely, if ever, American) shines his boots with a "boss oil shine," or otherwise, as advertised on a card above the chairs. Every hotel has some of these chairs, and the guests resort to them each morning and pay their ten cents cheerfully; it is only the street chair men who charge five. It is useless putting one's boots outside the bedroom door in an hotel, unless one wants them spat into by mistake; and no domestic

servant in America will ever touch a boot: it is not work for a freeborn soul, and is degrading. Many men black their own boots—keeping a set of tackle for the purpose in their bed or bath room—but the majority have recourse to the street chairs, which are to be found at almost every corner. There are a few of these chairs in England, but only a few.

The hotels are luxurious in the extreme, though lacking some of the homelike qualities which make an English inn so pleasant to an Englishman. They are warmed equally throughout, as are all buildings in America, and the passages being as warm as the rooms, the American traveller generally elects to sit in the passage or hall—where there is more life and movement, and he likes to watch the people going in and out of the hotel. To assist this practice many hotels have a glass front to their hall on each side of the door. In this place sit a row of the guests, gazing out on the street, and exposing the soles of their boots to the view of the passers by, as they rest their feet on a brass rail

running along inside the window. The effect is quaint, and if the people in the glass case look rather like specimens in a museum, they are amply repaid by seeing all that goes on, and by being enabled to contemplate the gloss on their own boots, in which they naturally feel the pride of authorship.

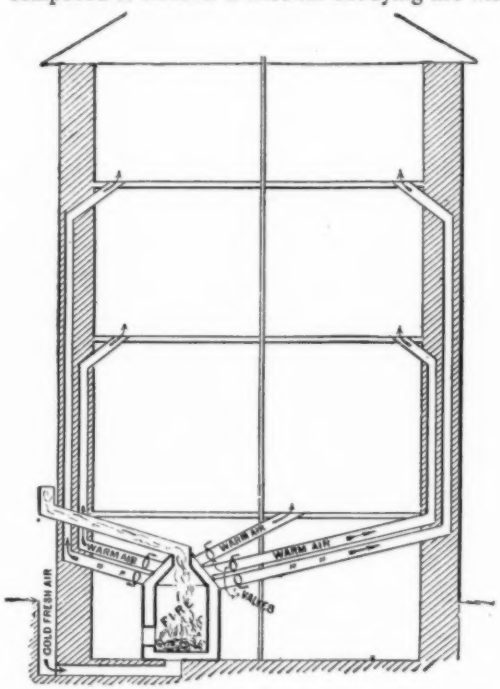
The bills of fare are prodigious in size and marvellous in their variety. The American appetite is enormous, and yet the American does not get fat, and always looks ready for dinner; but then he does not sleep much, and is always on the move.

The fashion common in many hotels—especially provincial ones—of bringing in the whole dinner, soup, fish, entrées, joints, sweets, and cheese at one fell swoop, is intensely exasperating to the average Britisher. The idea is, it may be assumed, to save all waiting, and enable people to "stoke" at top speed and get away to work again.

You are surrounded by a multitude of small dishes, and by the time you have eaten your way through half, the rest are lukewarm, and when the last dish is reached its temperature is indistinguishable from the ice cream which follows. But the American gets "through" so quickly that the viands have no chance to get cold. The speed with which they pass from plate to mouth, as the diner dives with unerring precision into the various differently situated dishes, is sufficient to keep up their temperature.

Of course, the foreigner can order his dishes one by one if he pleases; but this is the one and only way to chase the broad smile from the face of the apparently ever-amused black waiter, and when that smile is extinguished everything seems dark.

Iced water is the invariable accompaniment, or precursor, to all meals. A glass of the cheering beverage is placed before each guest the moment he takes his seat and before he gives his order. There is iced water on draught in all railway cars, in all houses, and in most offices. Natural ice is chiefly used, and a block is delivered at each house in the morning; the ice and the milk come together.



The tropical summer heat probably occasioned the use of ice in the first instance, but it is now used all the year round. The custom of providing the guest with a glass of water at meals, whether he asks for it or not, may have helped to produce the temperance in the use of strong drink so noticeable everywhere in America. In an English hotel, about the most difficult thing to obtain is a glass of water, and when obtained it is not always drinkable.

The conditions of life in summer and winter respectively differ more widely in America than in England. In summer, the New Yorker has to walk about with as little clothing on as possible; he much prefers not to walk in the city at all, but to transplant himself to one of the numerous seaside resorts in the neighbourhood; the restaurants are provided with fans for circulating the air; wire mosquito doors protect the entrances to houses from these bloodthirsty insects; iced water flows more freely than ever—in fact, tropical weather has to be encountered.

In the winter, a temperature often below zero renders a more perfect system of house-heating than our primitive English one necessary, although the passages in our houses are cool enough in winter for most tastes.

In an American dwelling, or hotel, or train, the doors can be open constantly; there are no draughts, and the halls and passages are as warm as the rooms. That they are *too* hot for British tastes is merely a matter of national difference, and might easily be prevented; but that the system of heating throughout is good would appear to admit of little question.

The English fireplace is delightful—to those who can get near enough to it; its blaze and crackle are cheerful—except when it happens to go out. There are few delights equal to that felt when one is compelled to smother a cheerful but dying fire with

a shovelful of fresh coals—a fear of "spoiling the fire" having delayed the operation until the fear becomes a fact.

Our fire imparts a genial glow to a man's toes if he be in company, or to his coat-tails if he be alone; but the back of his neck in the one case, and the end of his proboscis in the other, is apt to get frostbitten. What a shudder agitates the fire-encircling crowd, should some one leave the door open; and what a coughing, should the wind blow down the chimney.

How conducive to sleep and equanimity is the sound like distant thunder produced in the small hours by the domestic "rootling" out the remains of last night's fire before lighting to-day's; and what a pleasing, ancient, Pompeii-like appearance is imparted to surrounding objects by the dust she raises.

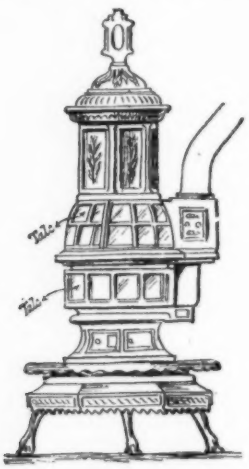
Above all, how pleasant it is to come down on a healthily cold morning and find a little flame up in one corner of the grate manfully contending with a mass of half-charred paper and a forest of damp wood which pours forth a dense cloud of yellow smoke in silent but pungent protest. With what solicitude is that flame watched by the shivering slave of the fireplace; how he gingerly pokes at it, puts on the "nubbly bits," lays the poker across it, gets his newspaper and burns it in the attempt to "draw up" the fire, and finally sits gloomily down to his breakfast to the accompaniment of volleys of crackling and showers of sparks from the triumphant grate.

There are only two good features about it—you can vent your rage upon it with a poker, and toast chestnuts on its bars. For the rest it is extravagant, for one third of the heat goes through the wall, and another third up the chimney; its chimney is always being swept, and the room it cheers with its presence rendered temporarily uninhabitable in consequence; if the chimney be not swept it incontinently catches fire—and then probably water. True, the fire ventilates the room, but it does so by sucking cold air under the door and across the floor and past the feet of the unfortunate people who dwell there.

In America, houses are heated on two or three systems—steam, hot-water, and hot-air. The two former are on the same principle as a greenhouse-heater, the stove being kept in the cellar below the house and "stoked" perhaps twice a day. The pipes run round the rooms, sometimes under the floors, and sometimes in a box above them. Both these systems appear to heat the same air over and over again, and provide for no admission of fresh.

The hot-air apparatus seems perfect in this respect, and is arranged as follows. In the cellar is a large double-shelled stove, the inner shell which contains the fire being provided with fire-door, grate-bars, and a flue leading to a chimney. Into the outer shell, which has no connection with the fire-box whatever, but merely surrounds it, cold air is admitted by a passage or pipe brought from outside the house. This air is warmed by passing round the fire-containing shell, and then traverses flues which are built into the walls and lead to the various passages and rooms of the house. Each flue is provided with a damper, so that the heat can be varied in any one room, or all of it concentrated in a few.

The hot air enters the rooms by a grating in the floor, which grating can also be closed or opened at pleasure. Thus a constant stream of fresh air, warmed to any required extent, is admitted to any part of the house or to the whole of it.

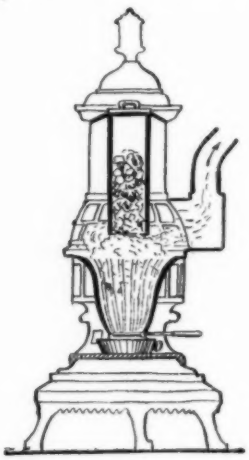


The stove burns smokeless, slow-burning coal—in England coke would answer well—and is rarely touched. The bars are placed in a movable frame, so that a few strokes of a handle shake the fire together and cause any ashes to fall into a removable pan.

The stove is filled up morning and night, and never allowed to go out during the winter. Should the house become too hot it is only necessary to shut all the dampers except one leading to a waste-air flue, or lower the fire by shutting off the draught. These expedients are not often resorted to in America, where it seems impossible to heat a

house, a boat, or a car too much for the people's taste.

In order that the cheerfulness popularly supposed to be produced by the sight of the fire may not be altogether wanting, the American has a stove in his rooms—at any rate in hotels—as well as the heating apparatus before described.



This stove stands boldly out in the middle of the room, and is circular in form, so that a dozen people can toast their toes thereat instead of only two or three. The fire is shut up in a glass (talc) box, in order to prevent any danger of smoke and to pro-

duce slow combustion; so that although visible it is protected from the violence of the poker. The coal used is hard, smokeless anthracite, which burns slowly and gives no flame.

A good and common form of this stove is shown in the sketch—rough section and outside view being given. Note the footrail running round the bottom—the ubiquitous footrail which is found in railway-cars, in hotels, and in all places where men do congregate.

To conclude the heating question, however. Is not the American the cleaner, more convenient, and cheaper method of warming houses? We have a prejudice against it which is largely due to the extravagant heat at which houses are kept in the States; even this has its advantages, for to it, presumably, the American owes his habit of early rising—the bed-room gets too hot to hold him! The English rise later because they dread the shudder which inevitably accompanies the smallest obtrusion of leg or wing into the arctic temperature of the chamber.

Could not the two extremes of heat and cold be avoided, and a comfortable and yet healthy temperature maintained?

An American visiting England in the winter stated that he was miserable because, although he had many friends, he was obliged to stick to his hotel—one of the few properly warmed ones we have—and refuse all invitations, as he dreaded the cold he knew he should meet in his friends' houses.

American houses and hotels are full of neat little contrivances for saving time and labour. One instance will suffice. The corners of the stairs where dirt accumulates, and into which the nose of no brush, however inquisitive, can penetrate, are filled up with loose brass angle pieces which can be taken up and polished occasionally.

The number of patents for door-fastenings, hinges, mats, keyholes, window-catches, and so on, is countless, and at every turn one sees some new 'dodge" for saving time or labour.

# SCIENCE NOTES.

## THE METEORITIC BOMBARDMENT OF THE MOON.

THE shooting stars, or meteor showers, which are now so generally looked for at certain seasons of the year, have again afforded a beautiful spectacle during the autumn and later months; and in places favoured by the weather, such as the South and West of England, the various "radiants" or points of the firmament at which they enter the earth's atmosphere have yielded a brilliant sight to the observer. At Folkestone, especially, on September 16, the showers known as γ Pegasids and ε Taurids afforded a spectacle which will not be forgotten by the visitors to that favourite sea-side resort. Seen on a wide horizon, as at the sea-side, the course of a meteorite is often watched to great advantage. The beginner in such observations notes with wonder the brief and brilliant career of the visitors. Some, especially such as are meeting the earth in its journey, rushing swiftly out of the dark and cold voids of interplanetary space, and striking with enormous velocity the earth's atmosphere, descend too far into the increasingly dense medium, and are burnt up by the combustion caused by the tremendous impact; unable to get out again in time, and subjected to a longer period of friction than those which simply graze the upper atmosphere, they are seen to end their brief but brilliant career in a flowing trail, leaving nothing but their ashes behind them, like a burnt-up rocket. "Most of the shooting stars that we see become visible in our atmosphere," says Mr. Ranyard, "at a height of about one hundred miles, and they mostly disappear before they reach a height of seventy miles above the sea level." Others that do not penetrate so far into our atmosphere often simply become incandescent during their briefer passage, and safely regain their orbit in outer space, although with reduced bulk owing to the combustion they have temporarily suffered. It is a very brilliant meteor which gets down to a level of fifty or sixty miles without being driven entirely into vapour, thus finally ending its career.

It is thus apparent that the earth's atmosphere acts as an armour to protect its inhabitants against these showers of missiles, which would easily destroy life probably every hour of the day, if not oftener, could these nodules of iron and stone safely penetrate our atmospheric shield. For it must be remembered that even if the size of the average meteorite may not exceed that of a walnut, which is somewhat a low estimate, its velocity varies from fifteen to at least forty-five miles a second, as it travels with or against the earth in its course. Another important consideration is the extent and degree to which this bombardment of the earth is going on. Shooting stars are, of course, chiefly seen at night; the equally numerous visitors to our atmosphere during the day are necessarily unobserved. But the rain of iron and stone still goes on. "The heavens are full of stones," says an eminent living astronomer. Recent revelations of the almost incredible number of meteors and meteor swarms which exist in space are sufficient to startle even the most stolid imagination. Professor H. A. Newton and others have calculated that, making all proper corrections, the number of meteorites which might be visible *over the whole earth* would be a little greater than ten thousand times as many as would be seen at one place. From this we gather that not less than *twenty millions of luminous meteors fall upon our planet daily*; each of these on a dark clear night would present us with the well-known phenomenon of a shooting star. If the number of invisible meteorites were added, it would be increased at least twentyfold; this would give us *four hundred millions of meteorites falling on the earth's surface daily in her path through space.*"[1] Even were this estimate reduced a hundredfold, it would still serve to suggest to us a picture of the hapless condition of our earth deprived of the armour which now shields her from this incessant and stupendous bombardment, under which life of all kinds would be impossible.

A new and beneficent function is thus discovered for the earth's atmosphere. Not only is it necessary for human respiration and other vital processes: it acts as a soft cushion to deaden and render harmless the tremendous hail of iron and stone which is continually being showered down upon her from all points. This view of the *rôle* of the atmosphere in the cosmical arrangements is doubtless comparatively new, but it will have to be taken account of in all future consideration of planetary conditions.[1] With our present knowledge it is impossible to avoid picturing to ourselves a time when the atmosphere may no longer be able to perform this function, and when its gradual attenuation shall afford an easy passage to these bombs of stone and iron, and the earth's fair surface shall be fully exposed to their merciless attack. That fateful time could only be in the far-off future, and if it ever arrives the attenuation and rarefaction of the atmosphere will in all probability already have reached such a degree as greatly to have altered, if not to have terminated, the respiratory conditions of life on our globe, more especially as regards the higher animals.

It is, perhaps, of more immediate practical interest to turn our eyes to one of the heavenly bodies which has already arrived at the stage in question, has already lost her atmosphere, and is entirely unshielded from meteoritic bombardment. We refer of course to our satellite, the moon. Here, according to the analogies of progressive decay which abound in the heavens, a decay which is filling the firmament with dead stars as well as with stars newly-born, we in all probability see the future of our own earth's surface so far as the loss of atmosphere is concerned.

The effect of meteoric bombardment upon the moon must necessarily tend to level her surface by reducing the height of her mountains and cliffs. Meteoritic fragments striking the rocks at a velocity of from fifteen to forty miles a second must inevi-

[1] *Leisure Hour*, pp. 713-714, 1890.

tably penetrate to a considerable depth and fracture and splinter the surface. That the action of gravity upon the moon, in spite of her small mass, is effective in pulling down disintegrated and loosely-piled rocks is evident to every one who has looked through a telescope at such familiar craters as Copernicus and Bullialdus, in which the slipping of the concentric rampart walls is so striking a feature. That there still exist at least one mountain range on the moon, as well as cliffs and ravines, is obvious, but the similar features which have been obliterated by perhaps millenniums of meteoritic bombardment must inevitably form a still larger proportion of the lunar surface. Whether there may still remain a lower layer of protecting atmosphere is wholly doubtful, looking at the extreme suddenness with which stars are occulted as they near the lunar disc. In any case the moon's unprotected condition in this respect as compared with the cushion of atmosphere (at least 200 miles in thickness) which encircles the earth is a startling fact. It is more than probable that in future the observed changes in the physical features of the moon will have to be watched in the light of the incessant meteoric bombardment to which she is so inevitably exposed.

### PROFESSOR EWING'S MODEL OF MAGNETISED MOLECULES.

Some recent important advances in the science of molecular physics, more especially as revealed in the industrial arts, have already been noticed in these pages.[1] One of the obvious postulates of the molecular theory, namely, that there is no such thing as an absolute solid known to science, was illustrated in considerable detail, and it was shown by many instances that neither the coldest iron nor the hardest granite is truly solid; each consists simply of discrete disjunctive particles. Each body or mass is really porous; other material substances can and do pass through them, just as truly as a man may pass through a crowd of people without touching any of them, and emerge on the other side.

The picture of an imaginary Demos, so minute in stature as to be able to thread his way through the interstices of a solid, avoiding the molecules in motion all around him, has been familiarised to us by Sir William Thompson and other eminent physicists in popular lectures; so that to-day many of the apparently impossible feats with which the Schoolmen illustrated their metaphysics have been provided with at least a basis of possibility, so far as the ultimate structure of matter is concerned.

The newest, and in many respects the most fruitful, experiments in illustration of the molecular theory of solids have just been supplied by Professor J. A. Ewing, who has recorded his work in a recent number of the "Philosophical Magazine" (September, 1890). The experiments show the sequence of events which occurs when a bar of metal is magnetised, or rather it gives us a sight of what happens to the constituent molecules of which the magnetised body is composed. It will at once be seen that here is an admirable sphere for experiment upon the intimate structure of solids, more especially of metals. It must be remembered that the phenomena of magnetism are held to show that the magnetisation is not simply an effect produced upon the mass of metal as a whole: it is an action upon the separate constituent molecules. Thus the individual molecules are able to turn freely and swing round, answering to the magnet like soldiers answering to the word of command. The well-known facts (i) that an iron bar becomes longer by the act of magnetisation, as if its molecules placed their longest dimensions in the direction of magnetisation, and (ii) that if magnetisation is effected suddenly, an ear close to the bar hears a clink, and another clink when the current is stopped, are very suggestive, and have helped to familiarise to us the molecular nature of the structure in which these effects take place. It will, however, be seen that certain problems in the processes above described still remain unsolved, and it is with these that Professor Ewing's experiments have been especially concerned.

Ever since the time of Ampère, physicists have been familiar with the idea that a magnetic substance consists of an assemblage of minute magnets. Professor Ewing accepts and starts from Weber's theory that the molecules of iron and cognate substances are always magnets, and that the process of magnetising consists in turning them from their many directions into one direction. But when it comes to entering into detail concerning magnetic induction, there is room for considerable uncertainty as to the kind of process going on. "Every one knows," says Dr. Oliver Lodge, "that when a substance is subjected to magnetising processes some of the magnetisation excited is only temporary, while some continues permanently after the magnetising forces are withdrawn—a fact which may be expressed by saying that the molecules are strained out of their old positions into new ones, and when released they spring back part way toward their old positions, but do not completely recover unless the strain has been very small, or the iron excessively soft."

In fact, Weber's theory, the more the phenomena were investigated, seemed encumbered with difficulties, and the alleged freedom of action of each molecule seemed to be seriously compromised. Internal constraint, permeability, residual magnetism, friction, "hysteresis" (a sort of internal or molecular magnetic friction by which the alternate magnetisations caused the iron to grow hot), stress, and temperature, were among the difficulties that presented themselves. It became necessary to assume some quasi-frictional resistance to the turning of the molecular magnets. Yet on the other hand there was the cardinal fact that even the feeblest force induces some magnetism. The behaviour of a set of magnetised molecules had been worked out theoretically by Weber and Maxwell on the "elastic solid" hypothesis; but the correlative hypothesis that, instead of being subject to arbitrary mechanical force, they might be perfectly free molecules, subject only to their own mutually perturbing magnetic forces, although suggested, had not been theoretically attacked or

[1] *Leisure Hour* for January 1890, pp. 208–210.

developed. Professor Ewing has attacked it experimentally with brilliant results. Even with so crude a model as an assemblage of pivoted compass needles in a plane, he has been able to imitate a great deal of the known behaviour of magnetic substances very satisfactorily.

The Professor has built up a molecular model of the simplest kind, in order to show what really happens to the molecules in successive stages of magnetisation. The model consists of a large number of short steel bar-magnets strongly magnetised, each pivoted upon a sharp vertical centre, and balanced to swing horizontally. The bars swing with but little friction, and their pole-strengths are sufficient to make the mutual forces quite mask the earth's directive force when they are set moderately near one another. The group is arranged on a board which slips into a large frame. The frame is wound round the top, bottom, and two sides with a coil, through which an adjustable current may be passed to expose the group to a nearly homogeneous external magnetic force. Little magnets furnished with air-vanes illustrate capitally what has been called magnetic viscosity. When the imposed force reaches a critical value some molecule swings round; the next neighbours, finding their stability weakened, follow suit, and the disturbance spreads through the group in a way eminently suggestive of the phenomena of time lag.

The scene, when the current is passed into the molecular field, is almost startling. The molecules do not arrange themselves with uniform polarity, all in parallel lines or in closed chains. They fall into groups, each group forming a stable configuration in itself. Lines predominate, two or more of the molecular magnets linking themselves in one straight line, and others in lines parallel or not. Three magnets, for instance, give two in one straight line, the third in a line parallel to this. In a group of seven, three will be at right angles to the other four; in fact, in many groups this right-angled relationship is a condition of stability. Square patterns have a special interest, because iron and nickel crystallise into the cubic system.

The many experiments made with the model repeat on a visible scale the cycle of events which takes place when the invisible molecules are magnetised in an ordinary mass of iron or steel, the process being traceable from the effects of even the smallest force up to that which produces saturation and thence through the return series. All the known phenomena of hysteresis, or retardation of effects behind the causes that produce them, can be imitated by the model, as well as many others less obvious and familiar.

The results thus obtained amount to a new revelation in the dynamics of magnetism. It seems to be demonstrated that the molecules are not only free from solid friction: they are subject to no obscure constraints elastic or viscous. The chief difficulties hitherto encountered in the molecular theory of induced magnetism are now explicable by the demonstration that the molecular magnets are constrained by no other forces than those due to their own mutual attractions and repulsions. This, says Dr. Oliver Lodge, is an immense simplification in the dynamics of magnetised bodies, and an almost incredible step forward towards the understanding of the structure of a solid. There is now established a definite calculable action among the molecules, from which much progress may be expected.

The theory of free molecules possessing velocities of translation (a gas) has long been known. The theory of stationary molecules subject to simple mutual constraints, already by Boscovich and others begun, may now be developed. For non-magnetic substances, as Professor Fitzgerald has hinted, there may be crystalline or other polar forces to take the place of the magnetic force in Professor Ewing's model.

### EARTHWORMS AND AGRICULTURE IN AFRICA.

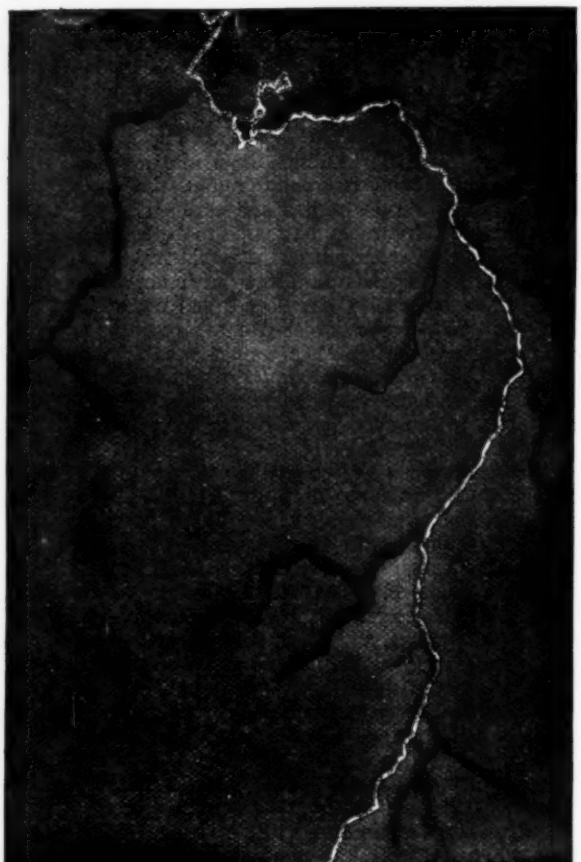
The important services rendered by the earthworm in breaking up and fertilising unfavourable soil have attracted considerable notice since Darwin called attention to the fact. This silent but potent little agriculturist is known to carry on in virgin land in New Zealand and some other countries the same useful work in draining, aerating, and levelling the soil, that it performs in our own islands. The latest evidence of its achievements, which transcends all we have yet heard, comes from Yorubaland, a part of the native territory adjacent to the colony of Lagos, West Africa. The authority for the facts is Mr. Alvan Millson, who has sent home, from the Government House at Lagos to the Colonial Office in England, some remarkable memoirs from personal observation. Mr. Millson's attention was attracted to the marvellous recuperative power of the soil, in spite of a persistent and exhausting rotation of crops. As each farmer in Yorubaland owns but a small portion of land, the property, perhaps, of his father and grandfather before him, upon which he is wholly dependent for his livelihood, he would be left entirely without food were its fertility to become exhausted. Apparently this is never the case. In spite of the exhaustive system of cultivation which has apparently been pursued for untold generations, the crops show no signs of falling off either in size or quality. Maize at 4½*d.* for a 70-lb. load can hardly be considered to command a famine price, while yams at 3*d.* a dozen, sweet potatoes at 1*d.* a 70-lb. load, beans at 1*s.* for 70 lbs., and guinea-corn at 6*d.* a load, cannot be justly lamented as involving ruin upon the purchasers.

On first realising these facts one looks around in search of a sufficient cause for such striking results. It is not so much the fertility of the soil as shown by the abundance of any single crop which surprises one. The problem is the astonishing rapidity with which it recovers from the careless cultivation and excessive cropping with such short intervals of rest to which it has for generations, and perhaps for centuries, been subjected.

Fresh from the lessons of Drummond's "Tropical Africa," with its interesting chapter on the fertilising effect of the work of termites or "white ants" in East Africa, it is natural to seek to explain the Yoruba phenomena in a similar manner. But ant-hills are

small and widely scattered throughout Yorubaland. Moreover, they are of too hard and insoluble a substance to serve readily as fertilisers. For mining purposes and the valuable process of bringing the subsoil to the surface they are doubtless of great service, but their slow and feeble efforts are plainly inadequate to produce the startling effects which we have to account for.

In the dry season the mystery of this wonderful and unfailing recuperation of the soil is at once solved. The whole surface of the ground between the blades of grass is found to be covered with serried ranks of cylindrical worm-casts. These worm-casts vary in height from a quarter of an inch to three inches, and exist in incredible numbers. For scores of square miles they crowd the land, closely packed, upright, and burnt by the sun into rigid rolls of hardened clay. Here they stand until the rains break them down into a fine powder, rich in plant food, and lending itself easily to the hoe of the farmer. On digging down, the soil is found to be drilled in all directions by countless multitudes of worm-drills, while from thirteen inches to two feet in depth the worms are found in the subsoil.



Having carefully removed the worm-casts of one season from two separate square feet of land at a considerable distance from one another, and chosen at random, Mr. Millson found the quantity to weigh not less than 10¾ lbs. in a thoroughly dry state. This gives a mean of over 5 lbs. per square foot. Mr. Millson adds: "Accepting this as the amount of earth brought to the surface every year by these worms, we get somewhat startling results. Speaking from the result of numerous experiments, 5 lbs. is a very moderate yearly estimate of the work done by these busy labourers on each square foot of soil. Even at this moderate estimate, however, of the annual result of their work, we have a total of not less than 62,233 tons of subsoil brought to the surface on each square mile of cultivable land in the Yoruba country every year. This work goes on unceasingly, year after year, and to the untiring labours of its earthworms this part of West Africa owes the livelihood of its people. Where the worms do not work the Yoruba knows that it is useless to make his farm."

Of the effect of this constant moving of the soil upon the health of the country it is not possible for anybody but an expert to speak, but it seems more than probable that the comparative freedom of this part of West Africa from dangerous malarial fevers is due, in part at least, to the work of earthworms in ventilating and constantly bringing to the surface the soil in which the malaria germs live and breed.

Here, then, in the work of the earthworm, it is again established that we discover a system of natural husbandry of the most surprising kind. Nature does her work unobtrusively, and it is only now that we are beginning to see the magnitude of the secret agricultural operations by which she does all that man could wish to imitate, and to which his most scientific methods are often but imperfect if not clumsy approximations.

### PHOTOGRAPHY OF LIGHTNING: THE "DARK FLASH."

Among the problems which have interested the minds of photographers and scientific men in the recent ardent study of lightning flashes taken with the camera, is the so-called dark flash. This phenomenon is well seen in the accompanying picture, which is reproduced by the kindness of the Rev. Arthur Rose, M.A., of Emmanuel College, Cambridge. The first explanation offered was to the effect that the dark flash is really a picture of a dead flash, that is, a flash which after it has disappeared leaves a dark track behind it, this track being really an opaque layer of nitrous oxide, brought into relief by a subsequent flash and thus recorded on the photographic plate. This explanation had for a time the support of very high authorities in physics. But the solution of the mystery has eventually come from the photographer and not the physicist. The mystery has been

completely cleared up by the experiments of Mr. Arthur Clayden, F.R.Met.Soc. The fact as demonstrated by him is shortly this: The process takes place entirely inside the camera, and has no existence whatever in nature. If the lens of the camera be covered the moment after the flash has occurred, the developed image will always come out bright. If, however, the plate be exposed (after a flash has acted upon it) either to the continued action of a feeble diffused light or to the powerful glare arising from one or more subsequent flashes, then, on development, the image of the original flash will probably come out black. It is simply a case of reversal. The effect is therefore not a meteorological or physical one, but purely chemical. It is merely necessary that the plate should be exposed to the action of a certain amount of light after it has received the impression and before development. "Dark flashes" will in future be obtained in the laboratory as well as in outdoor photography.

# Varieties.

### Japanese Courtship.

A Japanese courtship (writes a Japanese correspondent) is a very serious affair, and is not carried on in the free and easy style of Europe. Indeed, the principal parties do not appear until quite a late date in the proceedings.

Generally when a son reaches marriageable age the parents select a young lady whose social position and accomplishments appear to them suitable, and request a mutual friend of both parties, who is called a Nakodo, or middleman, to break the subject to the parents. The matter is laid before them, and before an answer is given the young man's antecedents are looked into. If everything is satisfactory, the young lady is asked her opinion on the subject, and as children in Japan regard the wishes of their parents to a great degree, the answer is invariably "Yes." Let me here remark that young ladies are generally very well satisfied, and there are fewer unhappy marriages in Japan than in many other countries where greater liberty is allowed to young people. The reply of the bashful maiden is conveyed to the middleman, and by him carried to the parents of the groom-elect, and then opportunity is afforded for the young people to meet each other, always, be it remembered, in the presence of the elder members of the family. Presents are interchanged. The bride is supplied by her future husband with trousseau, and sometimes a considerable sum of money changes hands. A lucky day having been decided upon, invitations are sent out to friends and relatives.

About eight o'clock in the evening the company begin to assemble at the groom's house. If the wedding takes place at the house of the bride, it indicates that the groom is adopted into her family, drops his own name, takes hers, and assumes the reins of government in the household, her father having abdicated in the young man's favour. This is not an infrequent occurrence.

The house is decorated for the occasion with fine embroidered ka-ke-mo-no (hanging pictures) and gaily painted screens (Bio-Bu); the to-ko-no-ma, or raised platform where repose household gods, is laden with fresh flowers, while around the house twinkle many gaily coloured lanterns, giving a festive air to everything.

The middleman, who at a wedding plays a conspicuous part, is there with his wife. The young groom occupies the mat at his left hand. Everything being in readiness, the bride appears in the midst of a crowd of attendants and young lady friends.

She is attired in a rich white kimono (robe) heavily embroidered with gold, but her face is entirely concealed by a white silk veil.

She advances bashfully into the room, and seats herself beside the wife of the Nakodo.

Near them is a small table, upon which are all kinds of fish and vegetables and sweetmeats plentifully placed, and a curious two-spouted vessel containing sake (rice spirit).

No vouze (priest) appears, as the ceremony is a civil contract. The groom, having lifted the vessel to his forehead, drinks, and presents the opposite side to his future partner, who in return imbibes. This is repeated thrice, when the couple become man and wife, and friends crowd around to present congratulations. In the midst of this the bride retires, but soon reappears in an entirely different costume and without her veil.

Dancing and singing girls now make their appearance, for a Japanese pays for dancing instead of exhibiting before others himself; and for a while the company is diverted by the plaintive ditties to the accompaniment of the samisen (banjo or guitar) and koto (stringed instrument like a harp).

A feast is spread and the inner man refreshed with a great variety of delicacies. Finally, after the newly-married couple have withdrawn, the party breaks up, almost at midnight.

The next day the married couple go to the temple and worship in the church of their religion. They visit also a few intimate friends and the Nakodo to return thanks for their marriage. A few days after, the bride's parents invite many of their friends and relatives and give a grand feast on the occasion of the first visit of the daughter after her marriage. The married couple then receive congratulations all round from both friends and relatives. Subsequently they start on their honeymoon journey to some famous place of amusement or interest.

**The 52nd Regiment at Waterloo.**—We have received another letter in confirmation of the statements in the "Leisure Hour" for June and October on the important part taken by the 52nd Regiment in securing the victory at Waterloo. The writer says, after expressing his deep interest in reading the narratives in the "Leisure Hour" about the crisis of the battle: "In the summer of 1848 I spent a day in company with the late Colonel Gawler. Conversation turned on the subject of Waterloo and the 52nd Regiment, in which Colonel Gawler was then serving. I believe he was attached to Colonel Colborne as aide-de-camp throughout the day. They saw the massive column of French Guards advancing to the attack. Colonel Colborne looked anxiously round again and again if he could see a staff officer. There was none at hand. At length, seeing it was necessary to do something, he gave the word, 'Shoulders forward!' (right or left I don't remember), followed by 'Fire!' Almost immediately the Duke of Wellington rode up and called out, 'Who commands here?' 'Colonel Colborne, my lord.' 'Tell him to continue his

movement! and he rode off to order up supports. Colonel Gawler told me he had not long before written an article in the 'United Service Magazine' giving a full account of the incident. He was decidedly of opinion that Colonel Colborne's judgment, and the gallant execution of his order by his distinguished regiment, the 52nd, proved the turning point of the battle."

**Meissonier's Picture of "1814."**—The engraving which we give as frontispiece is, by permission, from an etching by Georges Petit, Paris (Obach & Co., Cockspur St., London, W.). The original picture (30 inches by 20 inches) was exhibited in 1865, under the title of "Campagne de France." It was purchased by M. Delahanté for 70,000 francs (£2,800), but last year was resold for 850,000 francs (£34,000). The Emperor rides alone, on his white charger Marengo. Behind him is Marshal Ney, and further in the rear Marshal Berthier, who has fallen asleep in his saddle. Those at hand are Generals Drouot and Gourgaud, and M. de Flahaut.

**Adulterated Wine and Spirits.**—The "Times" lately published and commented on a list of "essences," advertised by a Berlin house, for giving to cheap coarse spirits the flavour and colour of brandy, gin, rum, and all kinds of wine and liquor. Port, sherry, and every variety of wine in common use can be thus cheaply manufactured, and sold at a large profit by dishonest merchants and publicans. Of the "Cognac essence" it is stated that 4 lb. of essence will suffice for 100 gallons of spirit, 10 under proof. The colours are sold in powder, and are warranted harmless, but incapable of detection by analysis. Other miscellaneous drugs and articles of adulteration are openly sold by this Berlin firm.

**Waste of Forests.**—In many parts of the United States there is enormous waste of forest trees, which are often felled and left to decay merely for getting present cash for the bark, for tanning or other purposes. When the enormous spaces of the republic are more densely peopled, this wanton waste will be deplored, and a public department will be established at Washington for conservation and utilisation of "Woods and Forests," by the labours of which important results, both economic and climatic, will be secured.

**Mont Blanc.**—It was a man of science, M. de Saussure, the geologist, who first attracted the attention of the civilised world to the ascent of Mont Blanc. What was once a rarely attempted feat gradually became an excursion, made every season by ambitious and muscular pedestrians. Many ladies have made the ascent among the thousands of tourists of all nationalities. Albert Smith's entertainment at the Egyptian Hall marked the climax of Cockneyism in Swiss travel. The Alpine Club, and mountaineers of high class, have long thought as little of Mont Blanc as of Snowdon or Ben Lomond. Another man of science lately brought fresh interest to the ascent. This time it was an astronomer and meteorologist. M. Janssens, of the French Institute, made the expedition last summer for making scientific observations. Not being a strong man, he had to employ porters to carry himself, as well as his apparatus and instruments, to the station of the Grand Mulets at 14,600 feet altitude. The ascent was by the greater plateaus and the Bosses du Dromedaire. In the Bossons hut the principal observations were made and recorded, but M. Janssens more than once was helped to the summit in favourable weather. By aid of porters Madame Janssens also made the ascent.

**Veteran Arctic Voyagers.**—William J. Walter, one of the survivors of the Sir John Franklin search expedition in the "Fox," recently died at Strood near Rochester. Mr. Hampton, a relative, also one of the crew of the "Fox," wrote to their old Commander, now Admiral Sir Francis Leopold M'Clintock, who thus replied: "Dear Mr. Hampton, I had not heard of the death of Walter, and I thank you for having written to tell me of it. It has pleased God to spare us hitherto, and in this we see His continuing mercy still overshadowing us. May we employ extended opportunities in serving Him, before all men openly and fearlessly. I think Dr. Walker (surgeon of the "Fox") is still living, in the United States. He served for some years in the United States army. I will send your letter to Sir Allen Young, who is, I believe, quite well. With every good wish, I remain your friend, F. L. McClintock."

**Waste of Life and of Wealth through Insanitary Conditions.**—The average rate of mortality in England has vastly improved in recent times, yet there is still much needless loss of life and of property through insanitary conditions, as Sir Thomas Crawford showed in his address to the Health Congress at Brighton. He quoted Sir James Paget's statement, the loss from sickness between the ages of fifteen and sixty-five, in England and Wales, amounts to about twenty weeks' work every year. Such is the tax on production and profit, through illness alone, much of it self-produced and removable. Clean homes, pure water, fresh air, suitable clothing, wholesome food, and well regulated lives would add enormously to the wealth as well as health of the people of England. At the next Sanitary Congress we recommend that some officials from the public service of China should be invited to be present, or to send reports of the efficient system of dealing with the refuse of large cities, for the benefit of the people, and the enrichment of the land. In England something was shown at the Health Exhibition to have been effected in the way of sewage irrigation, but there is room for much more being done in this direction by English chemistry combined with Chinese experience.

**Sparrows in Australia.**—At a meeting of the Philosophical Society at Wellington, New Zealand, Sir Walter Buller claimed the credit of having introduced the English sparrow into the colony. It was in 1865, when he paid £100 for the importation of 100 sparrows. Some farmers, with the prejudice too common in the old country, tried to extirpate them, but with increase of knowledge and sense, the use of birds in checking insect devastation is more generally recognised. In Guernsey the bailiff of each parish used to pay four doubles, or a halfpenny, for the head of every sparrow, but this is not now done.

**Census.**—It is to be hoped that efforts will be made to work upon the Census returns without needless delay. The returns of 1861 were not published until 1865, and those of 1871 were delayed almost as long. Matters were better as to 1881, and it is to be hoped that there will be greater improvement after 1891. The superintendents and other officials should not be allowed to spin out the office work for years.

**Irish Pilchard Fisheries.**—Large catches can usually be taken and sold for at least 20*s.* per thousand, but most of the gain is lost to the Irish, and goes to the Cornish and other fishermen, with better boats and more energy.

**Patent Rights and Revenue.**—In the year 1889 the come of the Patent Office was £151,794, of which sum £93,000 was paid for renewal of patents. The surplus paid over from the Patent Office is little more than the sum derived from renewal fees. This shows that the establishment is rather a costly one to the country, especially if pensions are taken into account. But the office is important for encouragement of art and industry, although there are some who oppose the whole system of patents as a "taxation on inventors."

**North American Indians.**—During a recent exploring expedition in the cañons of Colorado, Colonel Holabird brought back to San Francisco tidings of the discovery of a tribe of Red Indians, living in an almost inaccessible district, remote from civilisation, and now first approached by explorers. Most of the people of this Yava Supai tribe, as it is called, had never seen a white man. Some of them had seen the Mormon leader, J. D. Lee, while he was a fugitive, before he was caught and shot for what is known as the Mountain Meadow massacre. Colonel Holabird represented to the U. S. Government the condition of these Indians, who pass a miserable existence, living on berries and roots, and afraid to venture out to regions where food could be better found, but where they would be shot down by the lawless border pioneers. Since the destruction of almost the whole of the buffaloes, there is no longer any living to be had by hunting. The Government has an Indian Department for tribes in fixed settlements, but professes inability to help wandering people. These seem to be relics of the once numerous family of Apache Indians.

**Frozen Meat from the River Plate.—Hints to Australian Exporters.**—A correspondent of the "Journal de Genève" gives an interesting account of the preparation of frozen meat on the River Plate for transportation to this country. He points out that the essential thing for a manufactory of this kind is to be able to place the congealed meat direct on board the steamer without coming even for a few minutes in contact with the sun. He says the manufactory in question has a wharf on the river bank at which vessels of 2,500 tons burthen can lie at anchor, so that the carcasses of the sheep are conveyed direct from the freezing chambers of the factory to those of the steamer. They are slaughtered and dressed so rapidly that twenty men can easily dispose of 1,000 animals in the course of the day. The carcasses are hung up to dry in a large chamber for several hours, and they are then taken to the next freezing chamber, those that show the slightest sign of any wound or defect being put on one side, and sold at the market of the town. The first freezing chamber is only about 10 degrees Fahrenheit, as it is not considered desirable to let the meat be frozen too suddenly on the surface, but rather that the cold air should penetrate gradually inward. After remaining for a few hours in the first freezing chamber, the carcasses are taken into a second, where the temperature is 30 degrees below zero. Here they remain for three days, at the end of which they are completely congealed, and as hard as wood. They are then placed in coarse muslin bags to protect them from dirt, and await in the storehouse, the temperature of which is the same as that of the second freezing chamber, and which will hold 30,000 carcasses, the steamer which is to bring them to England. It is estimated that each carcass weighs on an average 48 lb., and as the sheep do not cost more than 4*s.* each, and the meat sells for 4*d.* a pound, there is a good margin for profit, even after payment of freight (not quite a penny per pound) and other expenses. The fat is especially prepared for the market, the blood is used for manure, and the offal is sent to Buenos Ayres.

**Canadian Cheddar.**—In spite of the exertions of Archdeacon Denison to protect the interests of British Cheddar cheese-makers, the imports of Canadian cheese steadily increase. Last year the amount of all kinds sent to England from the Dominion was nearly 90,000,000 lbs., and up to August of 1890 there was a vast increase over the number of boxes in the months of the preceding year. It is becoming an immense trade.

**Third-Class Passengers.**—During the ten years 1879 to 1889, the third-class passengers on British railways increased by the vast number of 222,000,000. In the same period, the number of first-class travellers fell from 39,000,000 to 30,000,000; and of second-class from 63,431,000 to 62,878,000. The Midland Railway was the first to abolish second-class fares, only running now first and third class carriages. On the Great Western there were special trains with only first and second class carriages, but this year every train carries third-class passengers.

**The largest Sailing-Ship in the World.**—At Partick on the Clyde, there was launched in August 1890 the largest sailing-ship in the world, the "France," built for MM. Bordes & Cie. of Bordeaux. This firm possesses already a splendid fleet of traders. The "France" is 360 feet long, nearly 50 broad, and 30 deep. The gross tonnage is 3,750, and the dead weight she is capable of carrying is 6,150 tons. There are five masts; the mizen mast is 140 feet long, made of one huge tree. The bowsprit is 50 feet long, and its diameter from 30 to 12 inches. These figures may give an idea of the size of the ship, which is proportionally large in every part. The ship is in structure of many separate watertight compartments. The whole of the standing rigging is formed of steel-rope, weighing 28 lbs. per fathom. This lower fixed rigging is in all six miles in length, and the running gear, also of steel rope, is above four miles in length. There are about 110 tons of steel in the rigging. It is about forty years since iron was first used for ship gear, and in large vessels is gradually superseding hemp ropes. For towing hawsers the superiority is universally acknowledged. The French mercantile navy may well be proud of such a vessel as that now added to the fleet of MM. Bordes & Cie. of Bordeaux. Of the comparative safety of steel rigging, nothing is yet ascertained, but every precaution is taken as to the use of lightning rods.

**Observatories at highest Elevations.**—Until recently the highest stations for observatories in meteorology were Pikes Peak, in the United States, at 14,134 feet above sea level, and Sonnblick in the Austrian Alps, 10,170 ft. Ben Nevis, the highest station in Great Britain, is much less than half that elevation. The French have now established the most elevated station in the world, at the Rocher des Bosses, 1,460 ft. below the summit of Mont Blanc, at an elevation of 14,320 ft. A cabin has been fitted up with many self-registering instruments. M. Vallot has the honour of forming this station, and it was here that M. Janssen made his observations last summer.

**Pauperism in England.**—In 1832 the sum annually expended in relief of pauperism by the State was £7,000,000. In 1834 the number of paupers was estimated to be 1,200,000. At the time of the introduction of the new Poor Law system, the sum spent in relief of paupers was at the rate of about ten shillings a head. At present in 1890, the number of paupers is not above 800,000, notwithstanding the great increase of population; and the amount expended is under £8,431,000, or less than six shillings a head. Manufacturing and mining districts have now fewer paupers, but the agricultural districts send many paupers to the towns.

**American Railway Statistics.**—The length of line-track open on January 1, 1890, was 161,397 miles in the United States, an increase over the preceding year of 5,731 miles. The average increase during the ten years 1880–1889 was 7,500 miles, so that the increase of the last reported year was much below the average. The gross earnings and net profit were everywhere increased, and most of all in the States west of the Mississippi and east of the Rocky Mountains. The advance was least in the Southern States. In 1889 the average number of passengers per mile of rail open was 71 per cent. more than in 1882. In British India there are only 16,000 miles of rail open.

**Stool-ball.**—The correspondent of a paper, who described the old English game of stool-ball, states that he has had more than a thousand applications for the "Rules of the Game." This is significant of the interest taken by English people in out-of-door amusements. There are other old sports and pastimes well worthy of being resuscitated, some of which are still popular in certain localities.

**Antiquity of Man.**—Dr. John Evans, F.R.S., in his address as president of the Anthropological section of the British Association at Leeds, after reviewing the discussions as to the antiquity of man, said: "On the whole, therefore, it appears to me that the present verdict as to tertiary man must be in the form of 'Not proven.' When we consider the vast amount of time comprised in the tertiary period, with its three great principal sub-divisions of the eocene, miocene, and pliocene, and when we bear in mind that of the vertebrate land animals of the eocene no one has survived to the present time, while of the pliocene but one—the hippopotamus—remains unmodified, the chances that man, as at present constituted, should also be a survivor from that period seems remote, and against the species *Homo sapiens* having existed in miocene times almost incalculable. The *à priori* improbability of finding man unchanged, while all the other vertebrate animals around him have, from natural causes, undergone more or less extensive modification, will induce all careful investigators to look closely at any evidence that would carry him back beyond quaternary times; and though it would be unsafe to deny the possibility of such an early origin for the human race, it would be unwise to regard it as established except on the clearest evidence."

**Meteoric Stone in Switzerland.**—During the very stormy weather of last summer a large meteoric stone was discovered among the débris and ruins caused by the cyclone in the Canton de Vaud, near Sentier. Its weight was over a kilogramme, or two pounds.

**Music at Night.**—In the "Occasional Meditations" of Bishop Hall he says: "How sweetly doth this music sound in this dead season! In the daytime it would not, it could not, so much affect the ear. All harmonious sounds are advanced by a silent darkness. Thus it is with the glad tidings of salvation; the Gospel never sounds so sweet as in the night of persecution or of our own private affliction. It is ever the same; the difference is in our disposition to receive it. O God, whose praise it is to give 'songs in the night,' make my prosperity conscionable and my crosses cheerful!"

**A Good Oath.**—The Bailiff (chief magistrate) in Guernsey and in Jersey, appointed by the Crown, on taking office still swears in good Norman French, "Faire droit au people, baillant et delivrant à chacun bonne et briève justice, au petit comme au grand, un riche comme del pauvre, sans exception de personne, gardant le droit des veuves, orphelins, étrangers, et autres personnes indefendus, autant qu'il lui sera possible." The Bailiff is President of the States, or local parliament (for there is "Home Rule" in the Channel Islands), and he is also chief judge in the Royal Court of Justice. The laws enacted by the States must be confirmed by the Queen in council. Mr. Freeman, in his "Norman Conquest of England," says: "The Islands form two perfectly distinct Commonwealths dependent on the British Crown, but not incorporated with the United Kingdom. Retaining their ancient constitutions, and enjoying the protection of the power of England, the Channel Islands unite the safety of a great kingdom with the local independence of a small commonwealth. How much they would lose by becoming a French department (like Corsica) I need not stop to point out. But they would also lose, though not nearly so much, by becoming an English county. Parliament can, on any emergency which may call for its interference, legislate for the Islands; but it must legislate specially for them, after special consideration of the circumstances of the case. Thus these little communities can never find themselves unexpectedly bound by some piece of general legislation passed without their knowledge, and possibly contrary to their interests."

**Dr. Döllinger on the Decrees of the Vatican Council.**—In a work edited by Dr. Reusch, published at Munich since the death of Dr. Döllinger, the "Letters and Explanations on the Vatican Decrees" are included. In this work is found the reply given by Dr. Döllinger to the numerous solicitations from eminent persons to submit his private judgment to the authority of the Head of the Church. Dr. Döllinger's firm answer was, "When I am told that I must swear to the truth of those doctrines, my feeling is just as if I were asked to swear that two and two make five, and not four."

**Across the American Isthmus.**—The Panama Canal scheme seems to have entirely collapsed so far as the original company under M. de Lesseps is concerned. If new funds are found, the concern may be carried on, at least till the engineering experts sent out to decide the matter have given their report. The supporters of the Nicaragua canal route are sanguine of success, and say that the periodical floods of the Chagres river render the completion of the Panama route impossible. It seems hardly possible that M. de Lesseps will ever see the end of the work, not one quarter of which has been accomplished, at ruinous cost of money and cruel loss of life. Of the Nicaragua route, though longer, there is more hope, and American perseverance is more likely to succeed than French enthusiasm.

**Bridging the Channel.**—When we are looking at the turbulent commotion of the waters of the Channel in stormy weather, the scheme of a bridge between England and France seems a mad proposal. But then, consider that the violence of the sea is only at the surface, and that at a very slight depth the water is quiet and unmoved, save by tides and currents. After what has been achieved by engineers in building the Forth Bridge, and other great works, there is nothing of insuperable difficulty in bridging the Channel. If one pillar can be fixed, any number can, for the sea bottom is the same everywhere, and with marvellously little variation of depth, except where sandbanks have been formed. The separation of the British Islands from the Continent, by subsidence sufficient to allow the Channel to be formed, is an event of very modern geological time. The French engineers, MM. Georges Hersent and Renaud, give satisfactory reports of their trials of the solidity of the chalk sea bottom. As to the shallowness of the water, it has been said that there is scarcely a spot in the Channel where, if St. Paul's were planted, the whole of the dome would not stand above the sea-level. The sandbanks would be bridged over. The piers would be so strong and high as to admit of no risk from passing ships, while there would be a new series of electric-light beacons to mark the courses of traffic.

**Pay in British and French Merchant Ships.**—Our A. B. seamen, on an average, get £4 5*s.* a month on steamers, and £3 on sailing-ships. The French sailor gets £2 16*s.* and £2 8*s.* per month. In the matter of wages, French shipowners have thus the advantage, and also they have less trouble with the crews, whether at sea, or in ports where ships touch. If temperance and discipline prevailed in the Mercantile Marine, as now in the Royal Navy, it would be a happy day for British sailors. There are some characteristic anomalies in the pay-rates. In French ships the cook usually gets £8 a month, or 200 francs, on an ordinary long-voyage steamer, the English cook getting only £5, or 100 shillings. On the other hand, a ship's carpenter gets on a British vessel £5 10*s.* or £5 15*s.*, on a French one only £2 16*s.* to £3 16*s.* per month. The French captains, mates, and engineers are, on the whole, better paid than in English merchant-ships.

**Trotting Record.**—On August 30, a horse named Roy Wilkes trotted a mile in 2 minutes, 8¼ seconds, at Independence, Iowa, the fastest mile trotted in the world's record.

**Maori-Mesmerists.**—A traveller who has recently spent much time and care in examining critically the features of the country lying between Wellington and Auckland, in the north island of New Zealand, describes to a friend the result of his explorations, adding: "What I enjoyed most was listening to the old chiefs in districts uncontaminated by civilisation. Their legends are wonderful, and display an extraordinary knowledge of the geography and features of New Zealand. The belief of the chiefs in Makutu (witchcraft) and in their Tuhongas (priests) is very firm, and the evidences adduced of mysterious faculties or influences possessed by the Tuhongas are almost beyond credence. They employ some power akin to mesmerism and clairvoyance, and exercise it in a manner which enables them to hold a position of great authority over the common natives. The initiated speak of Makutu only amongst themselves, never before women and children, and the deeper mysteries are discussed in 'close lodge.'"

**Anglo-Norman Tongue.**—The mixture of Norse and French, now known as Norman language, was introduced into England at the Conquest in 1066. It continued the language of official and fashionable life for three centuries. Grammar schools construed Latin into French, and the people who wished to seem cultured spoke this corrupt French. The first time English was officially used since the Conquest was in a proclamation of Henry III. in 1258. French was finally superseded by English in legal proceedings in 1362 (36th year of Edward III.). Already in 1340 boys at school had ceased to learn Latin by the medium of French. Law reports were still written in the Norman language up to A.D. 1600, and even now remains in official life in giving royal assent to Bills of Parliament. In the preface to an interesting collection of "Patois Poems of the Channel Islands," the editor, Mr. J. Linwood Pitts, gives a valuable summary of the history of the Romance languages, and of the Channel Islands dialect of Norman-French.

**Somerton.**—The Hampshire village of Somerton, where Canon Liddon spent the early years of his ministry, is remarkable for having had only two rectors during the long period of 117 years. Canon Beadon, who died in 1879, at the age of 101, held the living for 68 years. He succeeded his father, the Rev. Edwardes Beadon, who got the rectory, and a chaplaincy to George III., in 1763, and held these two appointments for nearly 50 years.

**Horse Accident Prevention Society.**—Among the numerous charitable and beneficent institutions in London, there are several which extend their operations to the "lower animals," as man calls them. The Society for Prevention of Accidents to Horses carries in its name its usefulness, and claims the public support. Sir Robert Fowler, M.P., is the treasurer, and Colonel Colville Chairman of Committee. One method of helping the horses is the distribution of gravel and sand on slippery roads. Several public bodies, including London vestries, have contributed to this kindly work. Does the Secretary, Mr. W. Scott, know that there is an old endowment called "The Gravel Trust" for this very object? The late Sir Charles Reed, M.P., Chairman of the London School Board, was one of the trustees, and wrote an account of the trust in the first volume of the "Boy's Own Paper."

**Electric Road Car.**—In the first week of October 1890, a long car or omnibus propelled by electricity made a first public journey in London upon the Kilburn and Maida Vale road. The steady, noiseless progress of this novel conveyance was a surprise to those who witnessed the passage of the well-laden vehicle as it glided along the level way. If the venture is successful, the change from horse-drawn vehicles will be welcomed. Road steam-carriages are, on some accounts, objectionable in cities, but the electric car seems well adapted for passenger traffic. In a recent number of the "Daily Graphic," an account of the earliest road steam-coach was reprinted (with an illustration) from the "Saturday Magazine" of October 6, 1832. The writer described his journey in this conveyance—invented by Captain Ogle, R.N., and Mr. Summers—from Oxford to Birmingham.

**Welsh Quarrymen in America.**—The mining department of the United States Geological Survey has issued a special report on the production of slate for roofing and various industrial uses. In 1889 the total value quarried was nearly three and a half million dollars, of which the roofing slate amounted to 2,775,271 dollars. The amount was double the value in 1880. At present about twelve States, from Maine to Georgia, are slate-producing; but quarrying has been commenced in Arkansas, Tennessee, California, and Utah. Most of the owners of the quarries are either Welshmen or of Welsh descent, and a large proportion of the workmen. They keep to the old country's customs and traditions, and some of the Welsh agitators and preachers who are gifted with eloquence would find glad auditors among the quarrymen on more important questions than tithes and Disestablishment. The Welsh quarrymen do not work on the first day of each month, nor on Saturday afternoons. The report gives statistical details as to numbers, wages, and other matters.

**The Dancing Pilgrims of Echternach.**—Lately we have heard little of the extraordinary popular festival which has been kept up at Echternach since mediæval times. In the month of May, 1890, no fewer than 15,000 "dancing saints" formed a procession through the streets, with music and banners, to the parish church, capering and dancing on the route. Thousands of spectators witnessed the strange scene. It is supposed that the observance, of which records exist as early as 1512, had its origin at the time of the terror caused by the Black Death epidemic in 1347. Whitsun week is the time of the annual dancing procession.—See "Leisure Hour" for 1871, p. 283.

**Trees in London City.**—It used to be said that there was no point in the City from which in summer the foliage of trees could not be seen. This was true at no distant time. The closing and planting of numerous disused churchyards will long preserve the sight of verdure. But some inroads are being made on the pleasant and useful domain of vegetation. The trees at the corner of Princes Street, near the Bank of England, have been destroyed, the site being wanted for the new hall of the Grocers' Company.

**French in Central Africa.**—By the international arrangements in dividing Africa, France has obtained not only the regions of Lake Tchad, but large territories which place Algeria in connection with Senegal on the one hand, and the Gulf of Guinea on the other, as far as Great Bassam, from which place it will be possible to travel to Algiers without leaving French territory, which, says M. Binger, a distinguished French explorer, is a great result for the unity of French possessions in Africa. M. Binger insists strongly on the necessity of there being no delay in the construction of the Trans-Sahara Railway. He points out that the main line must, however, be completed by branch lines to Lake Tchad and to the Niger. He contends that these railways, and the completion of the Upper Niger Railway, now in course of construction, need cost little or nothing to the State. The method he advises is the concession of these lines to companies, to whom considerable grants of land would be made on each side of their railways. During his sojourn in those Central African countries he noticed a very important commercial movement on the route between Bobo Diolason and Kong, which during a year amounted to a total of twelve hundred thousand francs. The commercial exchanges, including imports and exports, were, according to his computation, about fifteen million francs. M. Binger also agrees with Mr. Stanley that the inhabitants of these Central African regions would furnish France with a most valuable Colonial army.

## A Double Acrostic.

WHERE is the man *our* worth who fully feels?
How many all their lives our purpose miss!
Experience, even while it slowly steals
From man his treasures, scarce can teach him this.

1.

Stay, weary traveller. Check thy steed and stay!
And let my comfort thy tired spirits cheer.
It is not *only* cynic poets say
That man oft finds his "warmest welcome" here.

2.

Low is my origin, my station base;
Made to be crushed, I grovel in the mud,
Yet gleams of brightness gild my murky face,
And many a man for me has shed his blood.

3.

Although my *title* comes from far Cathay,
A *western* archer's cherished home am I;
His prowess marked a memorable day,
When freedom's flag was boldly raised on high.

4.

'Tis to a bird I partly owe my fame,
The church's ban at his small head was hurled;
Strange that a city having many a claim
To note, should *thus* be known throughout the world.

5.

Though current only in a foreign land,
I sound familiar to the English ear;
Full oft in contact with the barren sand,
To many a scrambling gamin I am dear.

6.

A foe to licence, I am freedom's friend—
To many a star and ribbon give my name;
But oft by tyrants I'm compelled to lend
Reluctant sanction to oppression's aim.

7.

As servant seek me, but as master flee,
For I have boundless power for good or ill.
In many a labour man depends on me,
And when at rest I cheer his leisure still.

PAUL TAYLOR.

# Household Queries

**Tar Stains.**—*Can you tell me how to remove tar from a black and white serge dress without discolouring it?*—All we can say for certain is, that tar must be removed as a rule by means of grease, salad oil or tallow being the safest. Then how to get the grease out without injuring the colour depends altogether upon the dye. In some cases, getting the bulk out first by ironing over blotting-paper, benzene will do the rest; in others soda or ammonia is better; in some it is difficult to name anything that will not start the colour. Except with really fast colours, tar is a desperate case.

**Soldering Iron.**—*Be so kind as to inform me the best way to tin a soldering iron.*—With a fine file clean the end bright, and apply immediately a drop of solution of sal-ammoniac. Then dip into or touch it with a clean surface of melted solder. Workmen generally file bright while pretty hot, and instantly apply a little powdered resin; but the above is the easiest for a novice.

**Smell of Mackintosh.**—*Could you kindly tell me what I ought to do to get rid of the very unpleasant smell my mackintosh has? I have had it a year, and tried putting it out in the air.*—After so long there is no hope of it. Occasionally there is such a specimen from bad rubber or solvent, and if it was bought at a respectable shop we should take it there and state the case, if the price is an object.

**Brown Bread.—Young Dog.**—*Please give me a recipe for making "brown bread"; and also tell me the diet, and number of times a day a dog four months old ought to be fed.*—We presume you will procure the proper "whole meal"; if you cannot, the best substitute is to mix equal quantities of bran, and middlings or sharps, and use one pound of this mixture to three or four pounds of flour, or to your taste. In making there are only two points to attend to: the dough must be mixed with rather more water, and must be baked rather more slowly and longer.—As to the young dog, at four months about four times a day is the thing, but in another month it may be brought down to thrice, making one meal always nearly the last thing, which should ensure a contented and quiet night. A good staple is either Spratt's biscuits soaked in hot water and a little milk, or oatmeal porridge made with the same. Give large bones for the puppy to gnaw at, but no small bones, or dainties from the table; very little meat should be given with his food, and the quantity carefully limited.

**Bleeding at the Nose.**—*My nose is continually bleeding, sometimes as many as three times in a day. Can you suggest any remedy?*—Only the frequency of this affection saves it from the character of that individual medical advice which we decline to give. Its being so constant an occurrence points probably to some strong constitutional tendency which ought to be made the subject of a personal consultation, and it is foolish to trifle with these things. However, you can try hazeline in teaspoonful doses in water three times a day, with probable advantage. Carry also a small bottle of 1 in 30 solution of either perchloride of iron, or of antipyrin same strength, and some cotton-wool; and on an attack, soak some wool and insert into the nostril, or both if affected, and slightly squeeze the nostrils upon it. If this fails, consult a doctor, which we strongly advise in any case, as diet and regimen probably want looking to.

**Sausages.—Cream.**—*Will you be good enough to give me a good recipe for making sausages; also a good way to make Devonshire cream?*—For the sausages, take 1 lb. lean pork, ¼lb. of fat, a teaspoonful each of salt and pepper, and half as much of dried marjoram, one quarter of a nutmeg grated, about one sixth of the rind of one lemon, and four or five sage leaves. Be sure to chop all the seasoning exceedingly fine, and to mince and mix the whole well, sending it twice through the machine, as sausage-meat is not properly mixed else. We can answer for this recipe, which may be seasoned rather more or less to taste; and it can be either fried in balls or put into skins.—With regard to the Devonshire cream, it must be remembered that, while there is no magic secret in this one county as such, the same result cannot be obtained except from similarly rich milk to that which is yielded on its magnificent pastures. The milk is strained at once into large metal pans, which are kept quite still in a cool dairy for twelve hours in summer up to twenty-four in winter. The pan is then placed at some distance over a very slow fire, so as to heat without even simmering, until the cream thickens on the top. The pan is then taken again to the cool dairy, and the cream lifted from the milk when cold. The process does not succeed so well on a small scale, but must be followed as closely as possible, the slow heating being the main thing.

**Hole in Earthenware.**—*Could you kindly tell me of anything that would stop permanently a small hole which has got pierced in the side of a large earthenware water jug?*—We doubt if it is worth the trouble, but you may succeed fairly by mixing dry a little plaster of Paris with an equal quantity of fresh-slaked hydraulic lime, coloured if necessary to match, and mixing this into a paste with glue in which some chrome-alum has been dissolved.

**Dressing-Tables.**—*I would be very glad of a few suggestions for making and covering bedroom dressing-tables. I am tired of muslin with pink lining underneath.*—The modern tendency towards Duchess or pedestal tables is really founded upon sound sanitary reasons, it being desirable to have as little absorbent or dust-holding material in a bedroom as possible. Such a table can be made pretty cheaply in sound deal, and then Aspinalled at home. For rough deal work that really requires to be hidden, the despised pink and white is about the best, because it is frequently changed and washed. Otherwise it is very easy to devise a cretonne covering to harmonise with the other furniture; or the top may be surrounded by rather wide scallops in cretonne edged with fringe; or crewel or other covers may have dependent edgings of various kinds. Wherever bare legs have to be covered down to the floor, however, plain washable material is much the best.

**Grapes.**—*Ego, Hilda, and Maggie would like to know the reason why their grapes do not colour, and so soon go mouldy.*—Generally, the causes would be too much moisture, and not enough heat or sun; but without any details as to how the grapes are grown it is impossible to answer the question more specifically. Outdoor grapes often do fail in this country if the summer is wet or unfavourable.

**Grease Stains.**—*Can you kindly tell my wife how best to get stains of candle grease out of a dress of silk and wool? It is a black dress.*—Use a hot iron repeatedly over successive sheets of clean blotting-paper. If the iron is hot, this may remove all the grease; but if not, either benzene or ammonia will dispose of the rest.

SAVED!

# THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN, AUTHOR OF "THE HOUSE OF THE WOLF," ETC.

ONE SECOND'S DELAY WOULD HAVE UNDONE US.

## CHAPTER V.—MISTRESS BERTRAM.

"DING! ding! ding! Aid ye the poor! Pray for the dead! Five o'clock and a murky morning."

The noise of the bell, and the cry which accompanied it, roused me from my first sleep in London, and that with a vengeance; the bell being rung and the words uttered within three feet of my head. Where did I sleep, then? Well, I had found a cozy resting-place behind some boards which stood propped against the wall of a baker's oven in a street near Moorgate. The wall was warm and smelt of new bread, and another besides myself had discovered its advantages. This was the watchman, who had slumbered away most of his vigil cheek by jowl with me, but, morning approaching, had roused himself, and before he was well out of his bed, certainly before he had left his bedroom, had begun—the ungrateful wretch—to prove his watchfulness by disturbing every one else.

I sat up and rubbed my eyes, grinding my shoulders well against the wall for warmth. I had no need to turn out yet, but I began to think, and the more I thought the harder I stared at the planks six inches before my nose. My thoughts turned upon a very knotty point; one that I had never seriously considered before. What was I going to do next? How was I going to live or to rear the new house of which I have made mention? Hitherto I had aimed simply at reaching London. London had paraded itself before my mind—though my mind should have known better—not as a town of cold streets and dreary alleys and shops open from seven to four with perhaps here and there a vacant place for an

apprentice; but as a gilded city of adventure and romance, in which a young man of enterprise, whether he wanted to go abroad or to rise at home, might be sure of finding his sword weighed, priced, and bought up on the instant, and himself valued at his own standard.

But London reached, the hoarding in Moorgate reached, and five o'clock in the morning reached, somehow these visions faded rapidly. In the cold reality left to me I felt myself astray. If I would stay at home, who was going to employ me? To whom should I apply? What patron had I? Or if I would go abroad, how was I to set about it?—how find a vessel, seeing that I might expect to be arrested the moment I showed my face in daylight?

Here all my experience failed me. I did not know what to do, though the time had come for action, and I must do or starve. It had been all very well when I was at Coton to propose that I would go up to London, and get across the water—such had been my dim notion—to the Courtenays and Killigrews, who with other refugees, Protestants for the most part, were lying on the French coast, waiting for better times. But now that I was in London, and as good as an outlaw myself, I saw no means of going to them. I seemed farther from my goal than I had been in Warwickshire.

Thinking very blankly over this I began to munch the piece of bread which I owed to the old dame at Tottenham; and had solemnly got through half of it, when the sound of rapid footsteps—the footsteps of women I judged from the lightness of the tread—caused me to hold my hand and listen. Whoever they were—and I wondered, for it was still early, and I had heard no one pass since the watchman left me—they came to a stand in front of my shelter, and one of them spoke. Her words made me start: unmistakably the voice was a gentlewoman's, such as I had not heard for almost a week. And at this place and hour, on the raw borderland of day and night, a gentlewoman was the last person I expected to light upon. Yet if the speaker were not some one of station, Petronilla's lessons had been thrown away upon me.

The words were uttered in a low voice; but the planks in front of me were thin, and the speaker was actually leaning against them. I caught every accent of what seemed to be the answer to a question. "Yes! yes! It is all right!" she said, a covert ring of impatience in her tone. "Take breath a moment. I do not see him now."

"Thank Heaven!" muttered another voice. As I had fancied, there were two persons. The latter speaker's tone smacked equally of breeding with the former's, but was rounder and fuller, and more masterful; and she appeared to be out of breath. "Then perhaps we have thrown him off the trail," she continued, after a short pause, in which she seemed to have somewhat recovered herself. "I distrusted him from the first, Anne—from the first. Yet, do you know, I never feared him as I did Master Clarence; and as it was too much to hope that we should be rid of both at once—they took good care of that!—why, the attempt had to be made while he was at home. But I always felt he was a spy"

"Who? Master Clarence?" asked she who had spoken first.

"Ay, he certainly. But I did not mean him. I meant Philip."

"Well, I—I said at first, you remember, that it was a foolhardy enterprise, mistress!"

"Tut, tut, girl!" quoth the other, tartly—this time the impatience lay with her, and she took no pains to conceal it—"we are not beaten yet. Come, look about. Cannot you remember where we are, nor which way the river should be? If the dawn were come, we could tell."

"But with the dawn——"

"The streets would fill. True, and, Master Philip giving the alarm, we should be detected before we had gone far. The more need, girl, to lose no time. I have my breath again, and the child is asleep. Let us venture one way or the other, and Heaven grant it be the right one!"

"Let me see," the younger woman answered slowly, as if in doubt. "Did we come by the church? No; we came the other way. Let us try this turning, then."

"Why, child, we came that way," was the decided answer. "What are you thinking of? That would take us straight back into his arms, the wretch! Come, come!—you loiter," continued this, the more masculine speaker, "and a minute may make all the difference between a prison and freedom. If we can reach the Lion Wharf by seven—it is like to be a dark morning and foggy—we may still escape before Master Philip brings the watch upon us."

They moved briskly away as she spoke, and her words were already growing indistinct from distance, while I remained still, idly seeking the clue to their talk and muttering over and over again the name Clarence, which seemed familiar to me, when a cry of alarm, in which I recognised one of their voices, cut short my reverie. I crawled with all speed from my shelter, and stood up, being still in a line with the boards, and not easily distinguishable. As she had said, it was a dark morning; but the roofs of the houses—now high, now low—could be plainly discerned a gainsta grey, drifting sky wherein the first signs of dawn were visible; and the blank outlines of the streets which met at this point could be seen. Six or seven yards from me, in the middle of the roadway, stood three dusky figures, of whom I judged the nearer, from their attitudes, to be the two women. The farthest seemed to be a man.

I was astonished to see that he was standing cap in hand—nay, I was disgusted as well, for I had crept out hot-fisted, expecting to be called upon to defend the women. But, despite the cry I had heard, they were talking to him quietly enough, as far as I could hear. And in a minute or so I saw the taller woman give him something.

He took it with a low bow, and appeared almost to sweep the dirt with his bonnet. She waved her hand in dismissal, and he stood back still uncovered. And—hey, presto!—the women tripped swiftly away.

By this time my curiosity was immensely excited, but for a moment I thought it was doomed to disappointment. I thought that it was all over.

It was not, by any means. The man stood looking after them until they reached the corner, and the moment they had passed it, he followed. His stealthy manner of going, and his fashion of peering after them, was enough for me. I guessed at once that he was dogging them, following them unknown to them and against their will; and with considerable elation I started after him, using the same precautions. What was sauce for the geese was sauce for the gander! So we went, two—one—one, slipping after one another through half-a-dozen dark streets, tending generally southwards.

Following him in this way I seldom caught a glimpse of the women. The man kept at a considerable distance behind them, and I had my attention fixed on him. But once or twice, when, turning a corner, I all but trod on his heels, I saw them; and presently an odd point about them struck me. There was a white kerchief or something attached apparently to the back of the one's cloak, which considerably assisted my stealthy friend to keep them in view. It puzzled me. Was it a signal to him? Was he really all the time acting in concert with them; and was I throwing away my pains? Or was the white object which so betrayed them merely the result of carelessness, and the lack of foresight of women grappling with a condition of things to which they were unaccustomed? Of course I could not decide this, the more as at that distance I failed to distinguish what the white something was, or even which of the two wore it.

Presently I got a clue to our position, for we crossed Cheapside close to Paul's Cross, which my childish memories of the town enabled me to recognise, even by that light. Here my friend looked up and down, and hung a minute on his heel before he followed the women, as if expecting or looking for some one. It might be that he was trying to make certain that the watch were not in sight. They were not, at any rate. Probably they had gone home to bed, for the morning was growing. And, after a momentary hesitation, he plunged into the narrow street down which the women had flitted.

HE STOOD BACK STILL UNCOVERED, AND THE WOMEN TRIPPED SWIFTLY AWAY.

He had only gone a few yards when I heard him cry out. The next instant, almost running against him myself, I saw what had happened. The women had craftily lain in wait for him in the little court into which the street ran, and had caught him as neatly as could be. When I came upon them, the taller woman was standing at bay with a passion that was almost fury in her pose and gesture. Her face, from which the hood of a coarse cloak had fallen back, was pale with anger; her grey eyes flashed, her teeth glimmered. Seeing her thus, and seeing the burden she carried under her cloak—which instinct told me was her child—I thought of a tigress brought to bay.

"You lying knave!" she hissed. "You Judas!"

The man recoiled a couple of paces, and in recoiling nearly touched me.

"What would you?" she continued. "What do you want? What would you do? You have been paid to go. Go, and leave us!"

"I dare not," he muttered, keeping away from her as if he dreaded a blow. She looked a woman who could deal a blow, a woman who could both love and hate fiercely and openly—as proud and frank and haughty a lady as I had ever seen in my life. "I dare not," he muttered sullenly; "I have my orders."

"Oh!" she cried, with scorn. "You have your orders, have you! The murder is out. But from whom, sirrah? Whose orders are to supersede mine? I would King Harry were alive, and I would have you whipped to Tyburn. Speak, rogue; who bade you follow me?"

He shook his head.

She looked about her wildly, passionately, and I saw that she was at her wits' end what to do, or how to escape him. But she was a woman. When she next spoke there was a marvellous change in her. Her face had grown soft, her voice low. "Philip," she said gently, "the purse was light. I will give you more. I will give you treble the amount within a few weeks, and I will thank you on my knees, and my husband shall be such a friend to you as you have never dreamed of, if you will only go home and be silent. Only that—or, better still, walk the streets an hour, and then report that you lost sight of us. Think, man, think!" she cried with energy—"the times may change. A little more, and Wyatt had been master of London last year. Now the people are fuller of discontent than ever, and these burnings and torturings, these Spaniards in the streets—England will not endure them long. The times will change. Let us go, and you will have a friend—when most you need one."

He shook his head sullenly. "I dare not do it," he said. And somehow I got the idea that he was telling the truth, and that it was not the man's stubborn nature only that withstood the bribe and the plea. He spoke as if he were repeating a lesson and the master were present.

When she saw that she could not move him, the anger which I think came more naturally to her broke out afresh. "You will not, you hound!" she cried. "Will neither threats nor promises move you?"

"Neither," he answered doggedly: "I have my orders."

So far, I had remained a quiet listener, standing in the mouth of the lane which opened upon the court where they were. The women had taken no notice of me; either because they did not see me, or because, seeing me, they thought that I was a hanger-on of the man before them. And he, having his back to me, and his eyes on them, could not see me. It was a surprise to him—a very great surprise, I think—when I took three steps forward, and gripped him by the scruff of his neck.

"You have your orders, have you?" I muttered in his ear, as I shook him to and fro, while the taller woman started back and the younger uttered a cry of alarm at my sudden appearance. "Well, you will not obey them. Do you hear? Your employer may go hang! You will do just what these ladies please to ask of you."

He struggled an instant; but he was an undersized man, and he could not loosen the hold which I had secured at my leisure. Then I noticed his hand going to his girdle in a suspicious way. "Stop that!" I said, flashing before his eyes a short, broad blade, which had cut many a deer's throat in Old Arden Forest. "You had better keep quiet, or it will be the worse for you! Now, mistress," I continued, "you can dispose of this little man as you please."

"Who are you?" she said, after a pause; during which she had stared at me in open astonishment. No doubt I was a wild-looking figure.

"A friend," I replied. "Or one who would be such. I saw this fellow follow you, and I followed him. For the last five minutes I have been listening to your talk. He was not amenable to reason then, but I think he will be now. What shall I do with him?"

She smiled faintly, but did not answer at once, the coolness and resolution with which she had faced him before failing her now, possibly in sheer astonishment, or because my appearance at her side, by removing the strain, sapped the strength. "I do not know," she said at length, in a vague, puzzled tone.

"Well," I answered. "You are going to the Lion Wharf, and ——"

"Oh, you fool!" she screamed out loud. "Oh, you fool!" she repeated, bitterly. "Now you have told him all."

I stood confounded. My cheeks burned with shame, and her look of contempt cut me like a knife. That the reproach was deserved I knew at once, for the man in my grasp gave a start, which proved that the information was not lost upon him. "Who told you?" the woman went on, clutching the child jealously to her breast, as though she saw herself menaced afresh. "Who told you about the Lion Wharf?"

"Never mind," I answered gloomily. "I have made a mistake, but it is easy to remedy it." And I took out my knife again. "Do you go on and leave us."

I hardly know whether I meant my threat or no. But my prisoner had no doubts. He shrieked out—a wild cry of fear which rang round the empty court—and by a rapid blow, despair giving him courage, he dashed the hunting-knife from my hand. This done he first flung himself on me, then tried by a sudden jerk to free himself. In a moment we were down on the stones, and tumbling over one another in the dirt, while he struggled to reach his knife, which was still in his girdle, and I strove to prevent him. The fight was sharp, but it lasted barely a minute. When the first effort of his despair was spent, I came uppermost, and he was but a child in my hands. Presently with my knee on his chest I looked up. The women were still there, the younger clinging to the other.

"Go! go!" I cried impatiently. Each second I expected the court to be invaded, for the man had screamed more than once.

But they hesitated. I had been forced to hurt him a little, and he was moaning piteously. "Who are you?" the elder woman asked—she who had spoken all through.

"Nay, never mind that!" I answered. "Do you go! Go while you can. You know the way to the Wharf."

"Yes," she answered. "But I cannot go and leave him at your mercy. Remember he is a man, and has——"

"He is a treacherous scoundrel," I answered, giving his throat a squeeze. "But he shall have one more chance. Listen, sirrah!" I continued to the man, "and stop that noise or I will knock out your teeth with my dagger-hilt. Listen and be silent. I shall go with these ladies, and I promise you this. If they are stopped or hindered on their way, or if evil happen to them at that wharf, whose name you had better forget, it will be the worse for you. Do you hear? You will suffer for it, though there be a dozen guards about you! Mind you," I added, "I have nothing to lose myself, for I am desperate already."

He vowed—the poor craven—with his stuttering tongue, that he would be true, and vowed it again and again. But I saw that his eyes did not meet mine. They glanced instead at the knife-blade, and I knew even while I pretended to trust him that he would betray us. My real hope lay in his fears, and in this, that as the fugitives knew the way to the wharf, and it could not now be far distant, we might reach it, and go on board some vessel—I had gathered they were flying the country—before this wretch could recover himself and get together a force to stop us. That was my real hope, and in that hope only I left him.

We went as fast as the women could walk. I did not trouble them with questions; indeed, I had myself no more leisure than enabled me to notice their general appearance, which was that of comfortable tradesmen's womenfolk. Their cloaks and hoods were plainly fashioned, and of coarse stuff, their shoes were thick, and no jewel or scrap of lace peeping out betrayed them. Yet there was something in their carriage which could not be hidden, something which, to my eye, told tales: so that minute by minute I became more sure that this was really an adventure worth pursuing, and that London had kept a reward in store for me besides its cold stones and inhospitable streets.

The city was beginning to rouse itself. As we flitted through the lanes and alleys which lie between Cheapside and the river, we met many people, chiefly of the lower classes, on their way to work. Yet in spite of this, we had no need to fear observation, for, though the morning was fully come, with the light had arrived such a thick, choking, yellow fog as I, being for the most part country-bred, had never experienced. It was so dense and blinding that we had a difficulty in keeping together, and even hand in hand could scarcely see one another. In my wonder how my companions found their way, I presently failed to notice their condition, and only remarked the distress and exhaustion which one of them was suffering, when she began, notwithstanding all her efforts, to lag behind. Then I sprang forward, blaming myself much. "Forgive me," I said. "You are tired, and no wonder. Let me carry the child, mistress."

Exhausted as she was, she drew away from me jealously. "No," she panted. "We are nearly there. I am better now." And she strained the child closer to her, as though she feared I might take it from her by force.

"Well, if you will not trust me," I answered, "let your friend carry it for a time. I can see you are tired out."

Through the mist she bent forward, and peered into my face, her eyes scarcely a foot from mine. The scrutiny seemed to satisfy her. She drew a long breath and held out her burden. "No," she said; "you shall take him. I will trust you."

I took the little wrapped-up thing as gently as I could. "You shall not repent it, if I can help it, Mistress—"

"Bertram," she said.

"Mistress Bertram," I repeated. "Now let us get on and lose no time."

A walk of a hundred yards or so brought us clear of the houses, and revealed before us, in place of all else, a yellow curtain of fog. Below this, at our feet, yet apparently a long way from us, was a strange, pale line of shimmering light, which they told me was the water. At first I could hardly believe this. But, pausing a moment while my companions whispered together, dull creakings and groanings and uncouth shouts and cries, and at last the regular beat of oars, came to my ears out of the bank of vapour, and convinced me that we really had the river before us.

Mistress Bertram turned to me abruptly. "Listen," she said, "and decide for yourself, my friend. We are close to the wharf now, and in a few minutes shall know our fate. It is possible that we may be intercepted at this point, and if that happen, it will be bad for me and worse for any one aiding me. You have done us gallant service, but you are young; and I am loth to drag you into perils which do not belong to you. Take my advice, then, and leave us now. I would I could reward you," she added, hastily, "but that knave has my purse."

I put the child gently back into her arms. "Good-bye," she said, with more feeling. "We thank you. Some day I may return to England, and have ample power——"

"Not so fast," I answered, stiffly. "Did you think it possible, mistress, that I would desert you now? I gave you back the child only because it might hamper me, and will be safer with you. Come, let us on at once to the wharf."

"You mean it?" she said.

"Of a certainty!" I answered, settling my cap on my head with perhaps a boyish touch of the braggart.

At any rate, she did not take me at once at my word; and her thought for me touched me the more because I judged her—I know not exactly why—to be a woman not over prone to think of others. "Do not be reckless," she said slowly, her eyes intently fixed on mine. "I should be sorry to bring evil upon you. You are but a boy."

"And yet," I answered, smiling, "there is as good as a price upon my head already. I should be

reckless if I stayed here. If you will take me with you, let us go. We have loitered too long already."

She turned then, asking no questions; but she looked at me from time to time in a puzzled way, as though she thought she ought to know me—as though I reminded her of some one. Paying little heed to this then, I hurried her and her companion down to the water, traversing a stretch of foreshore strewn with piles of wood and stacks of barrels and old rotting boats, between which the mud lay deep. Fortunately it was high tide, and so we had not far to go. In a minute or two I distinguished the hull of a ship looming large through the fog; and a few more steps placed us safely on a floating raft, on the far side of which the vessel lay moored.

There was only one man to be seen lounging on the raft, and the neighbourhood was quiet. My spirits rose as I looked round. "Is this the Whelp?" the tall lady asked. I had not heard the other open her mouth since the encounter in the court.

"Yes, it is the Whelp, madam," the man answered, saluting her and speaking formally, and with a foreign accent. "You are the lady who is expected?"

"I am," she answered, with authority. "Will you tell the captain that I desire to sail immediately, without a moment's delay? Do you understand?"

"Well, the tide is going out," quoth the sailor, dubiously, looking steadily into the fog, which hid the river. "It has just turned, it is true. But as to sailing——"

She cut him short. "Go, go! man. Tell your captain what I say. And let down a ladder for us to go on board."

He caught a rope which hung over the side, and, swinging himself up, disappeared. We stood below, listening to the weird sounds which came off the water, the creaking and flapping of masts and canvas, the whirr of wings and shrieks of unseen gulls, the distant hail of boatmen. A bell in the city solemnly tolled eight. The younger woman shivered. The elder's foot tapped impatiently on the planks. Shut in by the yellow walls of fog, I experienced a strange sense of solitude; it was as if we three were alone in the world—we three who had come together so strangely.

### CHAPTER VI.—MASTER CLARENCE.

WE had stood thus a few moments when a harsh voice hailing us from above put an end to our several thoughts and forebodings. We looked up and I saw half a dozen night-capped heads thrust over the bulwarks. A rope ladder came hurtling down at our feet, and a man nimbly descending held it tight at the bottom. "Now, madame!" he said briskly. They all, I noticed, had the same foreign accent, yet all spoke English; a singularity I did not understand, until I learned later that the boat was the Lion's Whelp, trading between London and Calais, and manned from the latter place.

Mistress Bertram ascended quickly and steadily, holding the baby in her arms. The other made some demur, lingering at the foot of the ladder and locking up as if afraid, until her companion chid her sharply. Then she too went up, but as she passed me—I was holding one side of the ladder steady—she shot at me from under her hood a look which disturbed me strangely.

It was the first time I had seen her face, and it was such a face as a man rarely forgets. Not because of its beauty; rather because it was a speaking face, a strange and expressive one, which the dark waving hair swelling in thick clusters upon either temple seemed to accentuate. The features were regular, but, the full red lips excepted, rather thin than shapely. The nose, too, was prominent. But the eyes! The eyes seemed to glorify the dark brilliant thinness of the face, and to print it upon the memory. They were dark flashing eyes, and their smile seemed to me perpetually to challenge, to allure and repulse, and even to goad. Sometimes they were gay, more rarely sad, sometimes soft, and again hard as steel. They changed in a moment as one or another approached her. But always at their gayest, there was a suspicion of weariness and fatigue in their depths. Or so I thought later.

Something of this flashed through my mind as I followed her up the side. But once on board I glanced round, forgetting her in the novelty of my position. The Whelp was decked fore and aft only, the blackness of the hold gaping amidships, spanned by a narrow gangway, which served to connect the two decks. We found ourselves in the fore-part, amid coils of rope and windlasses and water-casks; surrounded by half a dozen wild-looking sailors wearing blue knitted frocks and carrying sheath knives at their girdles.

THE CAPTAIN WAS TELLING A LONG STORY, AND TELLING IT VERY SLOWLY.

The foremost and biggest of these seemed to be the captain, although, so far as outward appearances went, the only difference between him and his crew lay in a marlin-spike which he wore slung to a thong

beside his knife. When I reached the deck he was telling a long story to Mistress Bertram, and telling it very slowly. But the drift of it I soon gathered. While the fog lasted he could not put to sea.

"Nonsense!" cried my masterful companion, chafing at his slowness of speech. "Why not? Would it be dangerous?"

"Well, madam, it would be dangerous," he answered, more slowly than ever. "Yes, it would be dangerous. And to put to sea in a fog? That is not seamanship. And your baggage has not arrived."

"Never mind my baggage!" she answered imperiously. "I have made other arrangements for it. Two or three things I know came on board last night. I want to start—to start at once, do you hear?"

The captain shook his head, and said sluggishly that it was impossible. Spitting on the deck he ground his heel leisurely round in a knothole. "Impossible," he repeated, "it would not be seamanship to start in a fog. When the fog lifts we will go. 'Twill be all the same to-morrow. We shall lie at Leigh to-night, whether we go now or go when the fog lifts."

"At Leigh?"

"That is it, madame."

"And when will you go from Leigh?" she cried indignantly.

"Daybreak to-morrow," he answered. "You leave it to me, mistress," he continued, in a tone of rough patronage, "and you will see your good man before you expect it."

"But, man!" she exclaimed, trembling with impotent rage. "Did not Master Bertram engage you to bring me across whenever I might be ready? Ay, and pay you handsomely for it? Did he not, sirrah?"

"To be sure, to be sure!" replied the giant unmoved. "Using seamanship and not going to sea in a fog, if it please you."

"It does not please me!" she retorted. "And why stay at Leigh?"

He looked up at the rigging, then down at the deck. He set his heel in the knothole, and ground it round again. Then he looked at his questioner with a broad smile. "Well, mistress, for a very good reason. It is there your good man is waiting for you. Only," added this careful keeper of a secret, "he bade me not tell any one."

She uttered a low cry, which might have been an echo of her baby's cooing, and convulsively clasped the child more tightly to her. "He is at Leigh!" she murmured, flushed and trembling, another woman altogether. Even her voice was wonderfully changed. "He is really at Leigh, you say?"

"To be sure!" replied the captain, with a portentous wink and a mysterious roll of the head. "He is there safe enough! Safe enough, you may bet your handsome face to a rushlight. And we will be there to-night."

She started up with a wild gesture. For a moment she had sat down on a cask standing beside her, and forgotten our peril, and the probability that we might never see Leigh at all. Now, I have said, she started up. "No, no!" she cried, struggling for breath and utterance. "Oh, no! no! Let us go at once. We must start at once!" Her voice was hysterical in its sudden anxiety and terror, as the consciousness of our position rolled back upon her. "Captain! listen, listen!" she pleaded. "Let us start now, and my husband will give you double. I will promise you double whatever he said if you will chance the fog."

I think all who heard her were moved, save the captain only. He rubbed his head and grinned. Slow and heavy, he saw nothing in her prayer save the freak of a woman wild to get to her man. He did not weigh her promise at a groat; she was but a woman. And being a foreigner, he did not perceive a certain air of breeding which might have influenced a native. He was one of those men against whose stupidity Father Carey used to say the gods fight in vain. When he answered good-naturedly, "No, no, mistress, it is impossible. It would not be seamanship," I felt that we might as well try to stop the ebbing tide as move him from his position.

The feeling was a maddening one. The special peril which menaced my companions I did not know; but I knew they feared pursuit, and I had every reason to fear it for myself. Yet at any moment, out of the fog which encircled us so closely that we could barely see the raft below—and the shore not at all—might come the tramp of hurrying feet and the stern hail of the law. It was maddening to think of this, and to know that we had only to cast off a rope or two in order to escape; and to know also that we were absolutely helpless.

I expected that Mistress Bertram, brave as she had shown herself, would burst into a passion of rage or tears. But apparently she had one hope left. She looked at me.

I tried to think—to think hard. Alas, I seemed only able to listen. An hour had gone by since we parted from that rascal in the court, and we might expect him to appear at any moment vengeful and exultant with a posse at his back. Yet I tried hard to think; and the fog presently suggested a possible course. "Look here," I said suddenly, speaking for the first time, "if you do not start until the fog lifts, captain, we may as well breakfast ashore, and return presently."

"That is as you please," he answered indifferently.

"What do you think?" I said, turning to my companions with as much carelessness as I could command. "Had we not better do that?"

Mistress Bertram did not understand, but in her despair she obeyed the motion of my hand mechanically, and walked to the side. The younger woman followed more slowly, so that I had to speak to her with some curtness, bidding her make haste; for I was in a fever until we were clear of the Whelp and the Lion Wharf. It had struck me that, if the ship were not to leave at once, we were nowhere in so much danger as on board. At large in the fog we might escape detection for a time. Our pursuers might as well look for a needle in a haystack as seek us through it when once we were clear of the wharf. And this was not the end of my idea. But for the present

it was enough. Therefore I took up Mistress Anne very short. "Come!" I said, "be quick! Let me help you."

She obeyed, and I was ashamed of my impatience when at the foot of the ladder she thanked me prettily. It was almost with good cheer in my voice and a rebound of spirits that I explained, as I hurried my companions across the raft, what my plan was.

The moment we were ashore I felt safer. The fog swallowed us up quick, as the Bible says. The very hull of the ship vanished from sight before we had gone half a dozen paces. I had never seen a London fog before, and to me it seemed portentous and providential; a marvel as great as the crimson hail which fell in the London gardens to mark her Majesty's accession.

Yet after all, without my happy thought, the fog would have availed us little. We had scarcely gone a score of yards before the cautious tread of several people hastening down the strand towards the wharf struck my ear. They were proceeding in silence, and we might not have noticed their approach if the foremost had not by chance tripped and fallen; whereupon one laughed and another swore. With a warning hand I grasped my companions' arms, and hurried them forward some paces until I felt sure that our figures could not be seen through the mist. Then I halted, and we stood listening, gazing into one another's strained eyes, while the steps came nearer and nearer, crossed our track, and then with a noisy rush thundered on the wooden raft. My ear caught the jingle of harness and the clank of weapons.

"It is the watch," I muttered. "Come, and make no noise. What I want is a little this way. I fancy I saw it as we passed down to the wharf."

They turned with me, but we had not taken many steps before Mistress Anne, who was walking on my left side, stumbled over something. She tried to save herself, but failed and fell heavily, uttering as she did so a loud cry. I sprang to her assistance, and even before I raised her I laid my hand lightly on her mouth. "Hush!" I said softly, "for safety's sake, make no noise. What is the matter?"

"Oh!" she moaned, making no effort to rise, "my ankle! my ankle! I am sure I have broken it."

I muttered my dismay, while Mistress Bertram, stooping anxiously, examined the injured limb. "Can you stand?" she asked.

But it was no time for questioning, and I put her aside. The troop which had passed were within easy hearing, and if there should be one among them familiar with the girl's voice, we might be pounced upon, fog or no fog. I felt that it was no time for ceremony, and picked Mistress Anne up in my arms, whispering to the elder woman: "Go on ahead! I think I see the boat. It is straight before you."

Luckily I was right, it was the boat; and so far well. But at the moment I spoke I heard a sudden outcry behind us, and knew the hunt was up. I plunged forward with my burden, recklessly and blindly, through mud and over obstacles. The wherry for which I was making was moored in the water a few feet from the edge. I had remarked it idly and without purpose as we came down to the wharf, and had even noticed that the oars were lying in it. Now, if we could reach it and start down the river for Leigh, we might by possibility gain that place, and meet Mistress Bertram's husband.

At any rate, nothing in the world seemed so desirable to me at the moment as the shelter of that boat. I plunged through the mud, and waded desperately through the water to it, Mistress Bertram scarce a whit behind me. I reached it, but reached it only as the foremost pursuer caught sight of us. I heard his shout of triumph, and somehow I bundled my burden into the boat—I remember that she clung about my neck in fear, and I had to loosen her hands roughly. But I did loosen them—in time. With one stroke of my hunting-knife I severed the rope, and pushing off the boat with all my strength, sprang into it as it floated away—and was in time. But one second's delay would have undone us. Two men were already in the water up to their knees, and their very breath was hot on my face as we swung out into the stream.

Fortunately, I had had experience of boats on the Avon, at Bidford and Stratford, and could pull a good oar. For a moment indeed the wherry rolled and dipped as I snatched up the sculls; but I quickly got her in hand, and, bending to my work, sent her spinning through the mist, every stroke I pulled increasing the distance between us and our now unseen foes. Happily we were below London Bridge, and had not that dangerous passage to make. The river, too, was nearly clear of craft, and though once and again in the Pool a huge hulk loomed suddenly across our bows, and then faded behind us into the mist like some monstrous phantom, and so told of a danger narrowly escaped, I thought it best to run all risks, and go ahead as long as the tide should ebb.

It was strange how suddenly we had passed from storm into calm. Mistress Anne had bound her ankle with a handkerchief, and bravely made light of the hurt; and now the two women sat crouching in the stern watching me, their heads together, their faces pale. The mist had closed round us, and we were alone again, gliding over the bosom of the great river that runs down to the sea. I was oddly struck by the strange current of life which for a week had tossed me from one adventure to another, only to bring me into contact at length with these two, and sweep me into the unknown whirlpool of their fortunes.

Who were they? A merchant's wife and her sister flying from Bishop Bonner's inquisition? I thought it likely. Their cloaks and hoods indeed, and all that I could see of their clothes, fell below such a condition; but probably they were worn as a disguise. Their speech rose as much above it, but I knew that of late many merchants' wives had become scholars, and might pass in noblemen's houses; even as in those days when London waxed fat, and set up and threw down governments, every alderman had come to ride in mail.

No doubt the women watching me in anxious

silence were as curious about me. I still bore the stains of country travel. I was unwashen, unkempt, my doublet was torn, the cloak I had cast at my feet was the very wreck of a cloak. Yet I read no distrust in their looks. The elder's brave eyes seemed ever thanking me. I never saw her lips move silently that they did not shape "Well done!" And though I caught Mistress Anne scanning me once or twice with an expression I could ill interpret, a smile took its place the moment her gaze met mine.

We had passed, but were still in sight of, Greenwich Palace—as they told me—when the mist rose suddenly like a curtain rolled away, and the cold bright February sun, shining out, disclosed the sparkling river with the green hills rising on our right hand. Here and there on its surface a small boat such as our own moved to and fro, and in the distant Pool from which we had come rose a little forest of masts. I hung on the oars a moment, and my eyes were drawn to a two-masted vessel which, nearly half a mile below us, was drifting down, gently heeling over with the current as the crew got up the sails. "I wonder whither she is bound," I said thoughtfully, "and whether they would take us on board by any chance."

Mistress Bertram shook her head. "I have no money," she answered sadly. "I fear we must go on to Leigh if it be any way possible. You are tired, and no wonder. But what is it?" with a sudden change of voice. "What is the matter?"

steering. When they saw that we had discovered them they hailed us in a loud voice, and I heard the steersman's feet rattle on the boards, as he cried to his men to give way, and stamped in very eagerness. My only reply was to take a longer stroke, and, pulling hard, to sweep away from them.

But presently my first strength died away, and the work began to tell upon me, and little by little they overhauled us. Not that I gave up at once for that. They were still some sixty yards behind, and for a few minutes at any rate I might put off capture. In that time something might happen. At the worst they were only three to one, and their boat looked light and cranky and easy to upset.

So I pulled on, savagely straining at the oars. But my chest heaved and my arms ached more and more with each stroke. The banks slid by us; we turned one bend, then another, though I saw nothing of them. I saw only the pursuing boat, on which my eyes were fixed, heard only the measured rattle of the oars in the rowlocks. A minute, two minutes, three minutes, passed. They had not gained on us, but the water was beginning to waver before my eyes, their boat seemed floating in the air, there was a pulsation in my ears louder than that of the oars. I struggled and yet I flagged. My knees trembled. Their boat shot nearer now, nearer and nearer, so that I could read the smile of triumph on the steersman's dark face and hear his cry of exultation. Nearer! and then

"LOOK BEHIND!"

I had flashed out the oars with a single touch, and begun to pull as fast as I could down the stream. No doubt my face too proclaimed my discovery and awoke her fears. "Look behind!" I muttered between my set teeth.

She turned, and on the instant uttered a low cry. A wherry like our own, but even lighter—in my first glance up the river I had not noticed it—had stolen nearer to us, and yet nearer, and now throwing aside disguise was in hot pursuit of us. There were three men on board, two rowing and one

with a cry I dropped the oars.

"Quick!" I panted to my companions. "Change places with me! So!" Trembling and out of breath as I was I crawled between the women, and gained the sternsheets of the boat. As I passed Mistress Bertram she clutched my arm. Her eyes as they met mine flashed fire, her lips were white. "The man steering!" she hissed between her teeth. "Leave the others. He is Clarence, and I fear him!"

I nodded; but still as the hostile boat bore

swiftly down upon us I cast a glance round to see if there were any help at hand. I saw no sign of any. I saw only the pale blue sky overhead, and the stream flowing swiftly under the boat. I drew my sword. The case was one rather for despair than courage. The women were in my charge, and if I did not acquit myself like a man now, when should I do so? Bah! it would soon be over.

There was an instant's confusion in the other boat, as the crew ceased rowing, and, seeing my attitude and not liking it, changed their seats. To my joy the man who had hitherto been steering flung a curse at the others and came forward to bear the brunt of the encounter. He was a tall sinewy man past middle age, with a clean-shaven face, a dark complexion, and cruel eyes. So he was Master Clarence! Well, he had the air of a swordsman and a soldier. I trembled for the women.

"Surrender, you fool!" he cried to me harshly. "In the Queen's name—do you hear? What do you in this company?"

I answered nothing, for I was out of breath. But softly, my eyes on his, I drew out with my left hand my hunting-knife. If I could beat aside his sword, I would spring upon him and drive the knife home with that hand. So, standing erect in bow and stern we faced one another, the man and the boy, the flush of rage and exertion on my cheek, a dark shade on his. And silently the boats drew together.

Thought is quick, quicker than anything else in the world, I suppose, for in some drawn-out second before the boats came together I had time to wonder where I had seen his face before, and to rack my memory. I knew no Master Clarence, yet I had seen this man somewhere. Another second, and away with thought! He was crouching for a spring. I drew back a little, then lunged—lunged with heart and hand. Our swords crossed and whistled—just crossed—and even as I saw his eyes gleam behind his point, the shock of the two boats coming together flung us both backwards and apart. A moment we reeled, staggering and throwing out wild hands. I strove hard to recover myself, nay, I almost did so; then I caught my foot in Mistress Anne's cloak, which she had left in her place, and fell heavily back into the boat.

I was up in a moment—on my knees at least—and unhurt. But another was before me. As I stooped half-risen, I saw one moment a dark shadow above me, and the next a sheet of flame shone before my eyes, and a tremendous shock swept all away. I fell senseless into the bottom of the boat, knowing nothing of what had happened to me.

## A Quarrel.

It's over; and we're strangers now!
  These years of love count nothing, then?
And you take back each heart-warm vow,
  And throw me back my vows again?

What did you say—what did I do?
  What did you do—what did I say?
And which began it—I or you?
  What does it matter, anyway?

We two, to part for a hard thought,
  A bitter word—repented—see—
When the whole world can give us naught
  If I lose you—and you lose me!

Think of our past, the days like flowers,
  Which still to memory lend due grace,
Think of the future—sunless hours
  When I should never see your face.

Think of the present. What is done
  Is done—but oh—forgive—forget!
Thank God—who meant us two for one,
  We have not lost each other yet!

E. NESBIT.

# STATESMEN OF EUROPE.

## ITALY.

### PART I.

THERE is perhaps no modern European country whose condition is more interesting at the present moment than that of Italy; and for the reason that Italy, in the modern acceptation of the word, may be said to be a new country, and is therefore able to manage its internal affairs unhampered by those traditions and modes of government which fatally stand in the way of rapid progress in older lands. Then, too, there is a great analogy between the Italian character and our English. Italy, perhaps more than any other Continental country, is the land in which individuals have great influence, and where the government is truly constitutional and liberal, according to our Anglo-Saxon way of understanding those terms.

To comprehend with necessary precision the mechanism of Italian politics, and the men who have hitherto directed its movements, as well as those who aspire to lead them in the future, it is needful to cast a glance to the past, and to sum up in a few words the character of a people come forth from a revolution, which although it was by no means bloody as compared with those of other lands, nevertheless has had results of almost equal importance, at least in respect to the political mutations produced in consequence in the European concert.

The Italian revolution found in 1848 a people which already enjoyed the benefits of the French revolution of 1789. Feudalism no longer existed, and if the aristocracy still maintained territorial importance, they had no political influence whatever. The rich gentlemen of Lombardy, the poor Piedmontese counts, the innumerable titled men of Tuscany, of the States of the Church, of the Kingdom of the two Sicilies, as well as of the small States of Emilia, lived without working from the profits which came to them from their lands, caring little about to-morrow, and taking but the faintest interest in politics. Upon how little these men managed to live is a matter that is scarcely realisable to the English mind. The Italian in those days, and even to-day, thinks himself rich upon what for us would be a bare subsistence, and so engrained in them is the desire to be a "gentleman," that is to say, to do no work, that they will submit to privations of which British Hodge would not dream, in order to be able to stand about all day on the piazza or in the café, gossiping and sunning themselves, with the happy consciousness that they have no duties either political or social. In this "noncuranza" (indifference) lies one of the gravest perils for Italy's future, as it is also the cause, direct and indirect, of the present financial and economic difficulties in which the country finds itself.

Among these gentlemen, or, to speak more correctly, men at large, there were very few who studied, and since the education of the youth of the richer classes was confined to the clergy, such instruction as they received had for its basis Greek and Latin classicism. Very few were those who occupied themselves with things which may truly be called modern, fewer still those who followed attentively the progress of European knowledge.

A social step below this petty nobility was the bourgeoisie, to whom the numerous Italian universities offered easy facilities to study the juridical and medical sciences. But even here the foundation of the instruction was based upon classicism.

Finally, to make up the twenty millions of Italians of those times, there remained the population of the cities and of the country. These men had nothing plebeian either in their aspirations or in their features: which latter, indeed, retained a truly noble cast, proving that their ancestors were of good stock—and this was especially the case in Central Italy, and is so to this day, the peasant having often a more gentlemanly bearing and more refinement in feeling and manners than his social superior.

This class was the backbone of the nation, and from it, assisted by the Piedmontese nobility, was to spring the ultimate regeneration of the nation. It was from the petty bourgeoisie and from the people that the town and country clergy were recruited. They had but a very superficial education, their morals were often more than doubtful, and they had little zeal either in the cause of religion or in the cause of the Church. They feared the petty princes who ruled over the various States, men who were religious to all outward appearance, but sought above all other things that the clergy should have no political importance, while they made use of them only too frequently as spies and as police officers. These, of course, were not the men who educated the upper classes; the tutors for the wealthier portion of the population were chosen from among the Jesuits and the Scolopi, the latter being considered in the light of Liberals.

The ten years that intervened between the defeat of '49 and the political revival of 1859 had brought to the front the educated bourgeoisie of Piedmont and the enlightened Piedmontese spirits who had noble blood in their veins. It was these men who took in hand the direction of the Unitarian movement in order to obtain the long desired independence of Italy—the liberation from the strangers' odious yoke. Among this nucleus of noble patriots it is curious to remark that the majority were lawyers—and indeed, to this day the lawyers have a preponderance in the Italian ministry and

Parliament, which accounts for the fact that the management of affairs is often a little too doctrinaire and lacks the practical character which would help to make things move with more ultimate advantage to the nation. Cavour, Sella, Minghetti, and Peruzzi were students of social economy, it is true, but there worked beside them a whole crowd of jurists and, curiously enough, of doctors. In military matters the men who were distinguished were Lamarmora, Cialdini, and Menabrea—the two latter still alive.

Such the germ from which was to spring that most noble revolution which freed Italy from Alps to sea, and which produced finer and more heroic characters than our century has ever been able to show.

While it was a question of merely working at internal politics, and while the requirements of the administration were limited to making honourable debts to aid in the regeneration of the neglected nation, debts which the country would be called upon to pay at a later date, the ruling classes in Italy had a relatively easy task. Indeed, in the period which lies between 1859 and 1876 Italy went on light-heartedly accumulating debt upon debt, without thought of the day of reckoning for this indifference with regard to the to-morrow. The cause may be sought first in the Italian character, which is strangely and happily light-hearted, and which at all times takes little care for the morrow, and has almost a superstitious fear with regard to looking forward; but secondly and very largely, in the classical education which the ruling classes had received, and which made them think that the Italy of their time was still the Italy of ancient Rome. They had been accustomed from their babyhood to believe that Italy was a rich country, of inexhaustible resources; and remembering perhaps a little too vividly the glories of imperial Rome and of the Renaissance, they deemed that the Italy of to-day must aim at taking the same stand in Europe, that its ambition should be to hold a leading economic and political place. Whoever in those days would dare to have printed or to have said in Parliament that Italy was, geographically speaking, a poor country, which does not produce enough grain for its inhabitants, which does not know how to make use of what might be its greatest riches, its grapes, because to make its wine it still employs the methods customary in the days of Virgil; that further, its soil produces neither iron nor coal, and therefore that it could never be an industrial country,—whoever, we say, would dare to have thought or spoken these things would at best have been regarded as a visionary, and most certainly would have been stigmatised as anti-patriotic and a calumniator of his land. And yet more abuse would have fallen on the head of whatever man had dared to preach that the mission of freed Italy was to occupy herself in setting her house in order—the house which foreign princes and clerical rulers had left in a disgracefully backward condition, so that it would need the labour of years to bring the country up to the standard of its European neighbours. Then arose further a desire for colonial enterprise—that will-o'-the-wisp which seems to dance before the eyes of all European States in these days, and which leads those who, like Italy, cannot afford such luxuries into grave economic embarrassments. The cause of even this desire must be sought in the classical education, with its traditions of ancient Latin grandeur.

When the Italian Parliament was first formed, two political parties governed the State—the Right and the Left—each contending for power. But these contending parties had in common the same system of government. The Right was by no means a conservative party, for it was the Right which had led the van for the destruction of the anterior political order; it was that party which, with the aid first of France and then of Germany, had brought about the political unity; which, too, had contracted the heavy debts; and which, moreover, fiercely combated the Temporal power of the Church, and in hope of destroying it fatally offended the Spiritual power, by permitting not irreligion but absolute religious tolerance in the schools.

The Left, which called itself the party of Progress, differed little from the Right. They too had always asked in Parliament for an increase of expenses for the working of the country, but on the other hand they also voted against new taxes. In this way they managed to benefit by these taxes and yet to avoid in the face of the country the odium of having voted in their favour. This extraordinary policy on the part of what nowadays have come to be called the Radicals, distinguishes them to this hour, and is the reason why no thinker can possibly take this party seriously, or, if he does, can but see in them one of the perils of contemporary Italy. For these men, when they are not visionary, which is their only excuse, are antipatriotic and dangerous to the country.

The Catholic party have always kept aloof from politics, a matter which is to be regretted, for though their vote might often lean to the side of reaction and antiquated views, they would prove on the other hand a useful stay to the moderate Liberal party, and would help to hold in check the hot-headed Republicans. But the Catholics, though rather from political indifference than from religious feelings, make a point of obeying the pontifical precept—"neither electors nor elected," the Pope not choosing to recognise that institution called the Italian Parliament.

As for the democratical republicans of Italy they live in a fool's paradise, and still fancy themselves in the heroic period when it was needful to fight Italy's battles under the standard of the condottiere Garibaldi, or to listen to the high-minded but visionary preachings of Mazzini. They have not realised, or will not realise, that a changed state of things requires changed conditions and changed views—a matter in which their hot-headed chief Garibaldi proved himself a wiser man than they when he resigned his sword to Victor Emmanuel, and recognised that Italy was not yet ripe for the ideal Republic, which probably will never be outside the pages of Plato and Sir Thomas More. The chiefs of the democratic party still keep all the ardour, all the convictions, all the fidelity to the principles and doctrines of 1848, all the love that those men showed for high-sounding phrases—phrases calcu-

lated to inspire a people that must rise and throw off its yoke, but not useful to-day when the work is done and the country has entered into the fruits obtained for it by its heroes, and when its foremost duty is to utilise those fruits quietly and sagaciously to the best advantage.

Now it is a curious fact that, in a Latin country, whatever political party has been in power for some twenty years invariably falls in consequence of its exercising a sort of legal tyranny. It becomes audacious, almost insolent, and believes that everything is permitted to it. It was this which happened to the party of the Right, which in consequence was obliged to resign its power into the hands of the Left in 1876, this party having till then constituted the parliamentary opposition. It was a change of men, but not a mutation of ruling principles. The new chiefs had been educated in the same school as the old, they had the same tendencies, as they quickly showed, and, excepting the abolition of one of the taxes—that upon the "macinato" (grist-tax)—they changed nothing in the financial working of the State. Even if they would have done so they could not, because they were subjected to the same wave of political necessities. They, too, were old classical scholars, and dreamed of a rapid primacy for their country. In the same manner, moreover, in which the Right had moulded its politics upon the Cabinet of Napoleon III, the Left took its inspiration from that of Berlin.

### AGOSTINO DEPRETIS.

The man whom the death of Ratazzi made head of this new administration was Agostino Depretis. He was far from being a great statesman, but he was on the other hand a person of great parliamentary ability. His ministerial life lasted ten years, and fraught with great difficulties, was nevertheless honoured and esteemed. The difficulties were the usual Italian ones—that is to say, the weight of the debts which had accumulated, and the new which it was necessary to contract.

While during the period anterior to the occupation of Rome the great and glorious events which had freed Italy cast a veil of patriotism over the eyes of every citizen, so that the smile of to-day did not make them think about the tears of to-morrow, Depretis, during his decade of parliamentary authority, had before him a labour much more arduous than that of his predecessors, who governed a people less under the influence of illusions. Sagacious as he was, he thoroughly comprehended that the Italian people had shown the measure of the weights which they were able to support, but he too was pushed on beyond where he desired to go by his classical reminiscences, by his colleagues, by his allies in the Chamber, to do something great and imposing, which would make Italy shine in the eyes of Europe. Now this something great and imposing could not be done except in the domain of foreign policy. Depretis was wont to say, good-humouredly and in perfect good faith, that in foreign policy the less one does the better it is; but on the other hand the tenacity of this old man in holding to power pushed him against his better judgment into initiating a foreign policy which would please the country, and which he was willing to undertake rather than that the guidance of the country's affairs should slip from his hands. For it is a fact too frequently evident that, however patriotic a statesman, personal ambition in the end forms the keystone of his actions and aims. The long habit of obedience to Depretis which Parliament had learned, the faith which he cherished in his own abilities, the passion for commanding, the real affection which he had for the reigning family and above all for King Humbert, whom at the outset of his regal career he held it his duty to assist and protect as a tutor protects a pupil, all these things contributed to keep the statesman of Stradella at the head of the Government at whatever cost. And there was thus created in Italy a new form of political magistracy which may be defined as a parliamentary dictatorship. From this, however, it is not to be supposed that the Italian Parliament had become corrupted to a servile and blind obedience to its chief; but it had got into an easy-going way, a way so soon slipt into by Italians, of thinking that it was on the whole best to follow their leader; and thus were sacrificed some of the noblest qualities which a Parliament should have, namely, the qualities of criticism and a just and proper opposition.

Taken collectively, too, an Italian Parliament has never shone in the way of producing individual characters, or leaders such as spring up every day in England—a fact largely due to the circumstance that self-government and parliamentary life are new features among a people who for centuries have groaned under foreign and native despotisms; for even their vaunted republics of the Middle Ages were but despotisms under a liberal name.

But while doing all justice to Depretis it cannot be denied that he was certainly an Italian statesman whose sceptical indifference to the opinions of his colleagues depressed their political character and independence, and it was thus that he not only created the tendency towards making the chief of the Cabinet a political dictator, but was able in a measure to transmit these traditions to his successor. He had the good qualities and the defects which were the consequence of his early education, and when he died he left behind him a memory neither mourned nor venerated, although it merited more respect and regret than it was to receive. He had been in power too long—the country was tired of him, yet it was evident that the only probability of a change was in his death, as indeed it proved.

In the parliamentary crisis which hurled the Right from power Agostino Depretis took under his leadership a number of the chiefs of the Left. It was but right and just that these chiefs should rise to power together with him. Different in character, in origin, in political and military value, these comrades whom he had chosen were rather allies of the moment than obedient followers. They came to be known as the Pentarchy, and ultimately were the chiefs of five groups hostile to the President of the Council. This Pentarchy consisted of Crispi, Cairoli, Nicotera, Zanardelli, and Baccarini; while among other important men whom he took over with him were Taiani, Mancini, Seismit-Doda, and

Brin. These were men who, during the decade of Depretis's dictatorship, were alternately his colleagues and his opponents, many of whom survived him, and one of whom has stepped into his shoes.

### FRANCESCO CRISPI.

Francesco Crispi, a Sicilian, a former conspirator and ardent republican, in the course of years and

FRANCESCO CRISPI.

also in consequence of that political common sense which calls itself Opportunism, and which Gambetta by no means invented, had been an earnest follower of Mazzini. He abandoned him, however, in time—that is to say, when he became aware of the complete inutility of the efforts put forward for national independence which had for their basis dark and illegal conspiracies. Led by the nature of his fiery character he soon entered into relationship with Garibaldi, and took a leading part in the condottiere's liberation work in Sicily and on the Continent during the year 1860, as well as during the troubled time of Aspromonte and Mentana.

In the great expedition of the Thousand of Melazzo, Crispi was the inspiring and dominating spirit. For a while after this event he had to live in hiding, and was sheltered under the roof of the patriotic baker, Giuseppe Dolfi, of Florence. When the fight was won and the Italian capital was moved to the Tuscan town, Crispi came too. An active, impetuous nature, violent even at times in his energy, he knew how to offer excellent guarantees as a man of order at the time of the death of Victor Emmanuel and of Pope Pio IX. In both these circumstances, in his position as Minister of the Interior he showed the measure of what he was worth ; and had it not been for the fact of his domestic scandals (he had, at the time, one legal and one illegal spouse, and lived openly with his illegal partner), he would not have been ousted from the Government, and would earlier perchance have occupied the proud position he now holds. Returned to the opposition benches he often confuted and bothered old Depretis, until the latter, shortly before his death, led him to join his party, regarded him as an ally, a pillar, and almost designated him his ministerial successor. Yet Crispi is the very antithesis of Depretis. The latter never lost control of his temper, Crispi loses it continually. Unlike his predecessor, too, Crispi is the antithesis of the Italian political temperament, a temperament formed of calculation, flexibility, and ambiguity. The former always sought to efface himself, preferring reality to appearances, whereas Crispi is fond of pomp and effect. Blunt and rough to a degree unusual in an Italian, he likes to make brusque sallies and striking *coups*. He is gifted with a strong will, audacity, and what is sometimes a strength in politics, unlimited self-confidence.

In his temperament certainly Crispi does not belie the old rhetorical figure which attributes to the sons of Ætna the volcanic nature of their native soil. Absolute, irascible, intolerant of opposition, even advanced age has not yet softened the fire of his character. To prove the truth of this it is only needful to see him in the camera, where the spectators from the Tribunes, in the colour more or less intense of the Premier's bald head, have a sure thermometer for estimating his mental state of excitement. As soon as he encounters an adversary he shoots forth arrows of speech that always hit their mark. These outbursts of intolerance, these nervous bounds from out his seat, these fisticuffs on the arm of his chair, with which he accompanies his speeches, have become proverbial in the Italian Parliament, and render him an orator who is far from sympathetic to his audience.

In moments of political difficulty Depretis entered Parliament with an ingenuous unconscious face. His spent weary eye, his tangled grey beard, his gouty feet, his general look of age, caused his adversaries to anticipate an easy defeat of their old enemy, who

NICOTERA.

quietly allowed them to discharge all the ammunition they had stored up against him. But when they had done, when the opportune moment came, he, who so admirably knew his parliamentary ground, managed in his reply so to confound his adversaries that not only the vote invariably turned

to his favour, but that he was able also to menace his opponents with punishment for their attempted misdeeds.

Not so Crispi. When he comes into the Chamber at a moment of political crisis, he does so with a haughty air, ready to give any reply, no

ZANARDELLI

matter how bold, how annihilating. At times he is even insolent to his critics, if needful he will hurl forth a remark which it is often impossible for him to maintain later, in cooler blood. He is like an artist enamoured of colour but careless of drawing, and this love of effects evinces itself in all his diplomatic actions. It is this love of ostentation that makes him so careless of financial considerations; this too that leads him to aspire above all to triumphs of foreign policy, so that his name may shine beyond the confines of his native land. Here, too often, he is misled to take appearance for substance. As is well known, Prince Bismarck three several times desired that Depretis should come and visit him at Friedrichsruh, but the then Italian Premier always found excellent reasons for not going thither. Crispi, when similarly invited, as soon as he became Prime Minister, accepted at once. This little feature characterises the diverse mental disposition of the two men. The foreign policy of Depretis was not planned to tickle the national vanity of the Italians, and it should always be borne in mind that as a people, both collectively and individually, the Italians are essentially vain. That of Crispi, on the other hand, fans it continually, and that too by that most potent lever to Italians, the great records of their classical past. The halo of general popularity which was universally denied to Depretis hovers undoubtedly around the head of Crispi, and though he has, of course, his enemies, his admirers outnumber them. And even his critics cannot deny to him that he has a fearlessness, an energy, a rapidity of action, which is all the more grateful and needful in the midst of the general uninterested lassitude which is the dominant note in the Italian political world. The rapidity, not to say precipitancy, with which in him action often follows resolve is not to be entirely condemned nor underrated in times in which every one tries to practise what the satiric poet Giusti defines as "l'arte di vivere a forza di scansi" (the art of living by means of shirking responsibilities).

The two Italian Premiers, so diverse of nature, also entered in very divergent modes upon their political career, and of this diversity of method they both no doubt felt the influence in the years of their maturity. Agostino Depretis of Stradella studied at the University, occupied himself with administrative matters, and then entered in 1849 the Piedmontese Parliament. He thus early learnt to conform himself to the grave and serene modes of legislature current in a methodical and steady-going country such as was Piedmont. Without ever having been rich, he nevertheless never knew what it was to want, neither was he swayed by romantic attachments and passions which have influenced so greatly and fatally his successor in office. Crispi, a man of desultory studies, entered the Sicilian Parliament in 1848 in the midst of revolutionary excitement, which he shared to the fullest extent. The Bourbons returned to power, he had to go into exile, and of course found his way to England, that only free haven in those troublous times. Here he knew what it was to suffer from hunger, and for the next years endured much misery, living a thoroughly Bohemian existence, while utilising his talents in unpaid partisan journalism, in presiding at patriotic conventicles, in attending revolutionary meetings. While Depretis had from the outset a clear conception of what was meant by the principle of authority, that it must be above all things of a character to curb, mollify, and moderate, the ideas of his successor on the point are the very opposite from his, namely, that authority should be evinced in an

CAVALLOTTI

imperative manner. What both had in common is a great industry—Crispi's industry is almost phenomenal in a southerner—and a great temperance in the matter of eating and drinking. Indeed, Depretis lived like an anchorite, and though Crispi nowadays makes a certain show in his house and

as obliged by his official character, in himself he is the most abstemious of men, and his habits too are of the simplest. These, however, are also Italian idiosyncrasies. Plain living is still in the Peninsula the order of the day, though it cannot in that country be held to be always consonant with high thinking.

What is likely to prove the cause of Crispi's ruin and his fall is that of late he has grown to be overbearing to a degree that is alienating even his best friends. This curious man, a mixture of audacity and weakness, who has vanquished by sheer force of arrogance, and who by arrogance may overturn himself, who speaks confidently of the things which he will do ten, twenty years hence, as though nothing could remove him from office—not even death—this man adores his Italian fatherland; but, strange contradiction, he despises the thirty millions of Italians of whom that fatherland is composed. When any one dares to criticise his actions, be it in print or speech, private or public, he at once becomes furious with anger. For the present, he still holds the reins of Government pretty tightly in his hands, and this because the Italian political parties are too divided and subdivided among themselves to settle upon a common policy and a common leader of Opposition. While discontent with his policy is murmured more or less loudly throughout the peninsula, Crispi is absolute dictator in the camera. And yet listen to the judgment of the deputies upon him. To the Liberals, be they of the Right or Left, he seems an autocrat of the purest metal. The Democrats consider him a courtier, the Conservatives a demagogue; to the Freemasons he seems a god; to the Catholics he is an Antichrist. The extreme Left would have him more French; the historical Left would have him less Austrian. He is praised, blamed, flattered by all sections. Each and all of these adversaries are animated by the common desire of persuading themselves that Francesco Crispi is one of their party and thinks exactly as they do—an illusion which his clever and Protean tactics do much to keep alive. He has a method of killing two birds with one stone which many a statesman might envy; and could he but control his temper rather more, he perchance might have risen to a really high place in diplomatic records.

The enemy whom Crispi has combated most virulently and most persistently is the Vatican. Crispi's advent to power certainly inaugurated a new phase of the Roman question. It is his policy that has given that virulent character to the conflict between the Vatican and the Quirinal which it did not previously possess. With regard to Catholicism and the Papacy, his sentiments are strongly anti-clerical. He is a violent sectarian. He hates, not only the Vatican and the Church, but everything which represents religious sentiment. His organ, the "Riforma," has always written with great animosity against religious ideas in every form. The whole thing is in his eyes one immense farce, to which an end must be put. With many Italian radicals anti-clericalism has served as a lever and a handle, but in Crispi it exists as an intense passion, a fixed idea.

Still, at the time of the Conclave which resulted in the election of Leo XIII, Crispi's attitude was marked by a tact and moderation such as was hardly to have been expected from so pronounced a sectarian. He informed the Sacred College that he would take measures that the liberty of the Conclave should be respected, adding, however, that in case the cardinals should decide to hold the Conclave out of Rome, he would at once occupy the Vatican.

When Leo XIII assumed the tiara he found the Papacy in a state of decadence. Pio IX, overwhelmed by the revolutionary wave, had taken up a rôle of isolation, which, however dignified, could only end in destroying his social and political influence. Abroad the relations with the Powers were either most lax or entirely broken off. At home, while still sovereign of Rome, he had forced the hand of the Italian Government, and driven them into the arms of the extreme Left party, then small in number though audacious, by forbidding the clergy and all good Catholics to take any direct part in politics. And after the loss of the temporal power in 1870, when in no position to insist upon conditions, his pretensions were in no wise abated.

Leo XIII, on the other hand, perfectly realised the necessity of marching with the times. Space does not admit of our tracing here the steps which he took to restore to the Papacy its former prestige and political ascendency. Briefly, he has made his influence felt in all Christian countries.

In thus seeking to extend his sphere of influence, Leo XIII's main aim was to work directly and indirectly toward the restoration of the territorial rights of the Holy See. His idea was to raise the Papacy to such a position that the incompatibility between the extent of its influence and the abnormal and precarious nature of its temporal position should strike all foreign eyes. But that was not enough. Italian opinion had also to be worked upon; a reaction must be brought about in the feelings of the country. This was the second part of the task to which Leo XIII devoted himself.

Now Crispi came into power to find this double programme in full swing. The Pontiff had effected the understanding with Germany which put an end to the Kulturkampf, and had issued the famous address of the 26th of May, 1887, in which after enumerating the concessions obtained from Germany, and boasting of the re-establishment of religious peace in that country, he went on to offer the olive branch to Italy, adding: "One issue toward peace is to be sought for in a state of affairs when the Sovereign Pontiff shall not be dependent on any Power, and shall enjoy liberty really worthy of the name, such as is his due. This situation, so far from being hurtful to the interests of Italy, would be of powerful assistance toward its safety and prosperity."

After this address, conciliation became the theme of the day, and for some little time it was really believed it would be brought about, though only the small section of extreme Italian Catholics truly supposed that it could be brought about by means of the restoration of the Temporal power. They thought the Pope would yield, and the Quirinal would yield, each in a measure. To force

the Government to declare itself, a Radical deputy of Milan brought forward the question in Parliament. Crispi avoided a debate, saying, "We do not need to make conciliation, since the State is not at war with any one."

However, in the following year, 1888, in which Leo XIII celebrated his jubilee, it was Crispi himself who commenced hostilities by inaugurating his Kulturkampf. The "Riforma," his official organ, redoubled the violence of its attacks, denouncing the Vatican as a hotbed of conspiracy against Italy. The incentive for this offensive warfare was this. A short time previously the clerical party had made an attempt to bring about a partial re-establishment of the Temporal power by means of a petition addressed to the Legislature, to be signed by the entire population.

In itself the idea of this appeal from all Italy was legal in its form, but let us investigate the actual conditions. Catholics are not allowed to take part in political elections. There is the veto, "neither elected nor electors." Very well. How, then, did the clerical party propose to reconcile the contradiction that these Italians who are forbidden to vote or to be elected should apply to members, chosen without their vote or against their vote, and ask them to interest themselves for the Pope? Were they to say: "We, the Catholics, don't want you as our Deputies; we don't recognise you; we were against your election; but at the same time we appeal to you in favour of the Pope who condemns you?" Clearly the two programmes did not fit, and the result of the petition might have been foreseen. The educated, rich, and governing classes did not sign it; indeed, in most cases, it is doubtful whether they were asked to do so. The signatures of persons who really understood what they were petitioning for may be counted on one's fingers. In Upper Italy, principally in Lombardy, a certain number were collected; few in the centre, very few in the Neapolitan provinces, and hardly any in Sicily. The bulk were of priests, men of the lower middle class, and peasants, signatures which, even had they been five times as many, were of no weight politically.

The Government, on their part, used every means to damage the petition, and even punished the few employés who signed it, showing thus an unworthy narrow-mindedness. The more dignified policy of *laissez faire* would only have exposed yet more plainly the weakness of the party in favour of the Temporal power, which, by the way, was prudently not mentioned in the petition.

Crispi's first move took the form of a law, which, under the pretext of reorganising the administrative elections, was really directed against the influence of the clericals in municipal bodies, and aimed at introducing sectarian and other elements more in accordance with his policy.

This preliminary skirmish was followed by the new Penal Code lately approved, which certainly contains some striking provisions, practically excluding a priest from the benefits of the common law and the rights of citizenship. That the country did not judge these measures too severe may be gathered from the ease with which the Bill was passed. Indeed Italy has no more formidable, implacable enemy than that which lives in her gates and which under the cloak of Christianity commits offences against morality and patriotism which show that the Gospel has not indeed truly inspired its actions. And it is this firm attitude on the part of Crispi against that subtle enemy Vaticanism which causes him to hold his place, as much as the lack of a worthy successor, for all patriotic and right-thinking Italians recognise that they cannot present too firm a front against this, their cruellest arch-enemy.

Therefore when Crispi is weighed in the balance and judged, it is admitted that, such as he is, with his faults and his merits, he is a capable man and a sincere patriot. Certainly there is to-day but one Minister in Italy, and that is Francesco Crispi; his colleagues are simply secretaries. A veritable dictatorship is his Government, which he has modelled upon that of Prince Bismarck, who is his idol. Like his prototype, when his Government is defeated, the Ministry resign, a shuffle of the cards takes place, and a new Cabinet is formed with Crispi at its head.

### BENEDETTO CAIROLI.

A sincere patriot also, and a man honourable, if it is possible, to a fault, was Benedetto Cairoli, who died at the close of 1889, mourned by the whole land. As a French writer well remarked, "he was the most beautiful personification of the Italian revolutionary legend." It is true that some said his heart was better than his head, that he was not always sagacious and acute—"più onesto che abile" (more honest than clever) was his own description of himself—but when the heart is right, it is not so easy for the head to go far astray. It was after the crisis of 1878 that he was called to hold ministerial office, almost simultaneously with King Humbert's accession to the throne. In his family patriotism was traditional. His mother was a grand figure, lion-hearted, loving Italy as her master passion, willing to give her sons, her all, for the sacred cause; a very Cornelia, a woman to whom may be applied the words of the old Hebrew writer: "The mother was marvellous above all and worthy of honourable memory." His brothers had successively died in their country's cause. There only remained at that time Benedetto, who had already proved his valour on the battle-field. His was an open frank disposition, he believed in all and in everything—no astute statesman, but a man whose private and public life was able to bear the minutest scrutiny. Called to be Minister of Foreign Affairs in a difficult period of national history, during the clash of conflicting interests that followed the treaty of San Stefano, it was his ardent desire that Italy should issue forth from the Berlin Congress with "clean hands." The natural consequence of this desire was necessarily that Italy, acquiring nothing for herself, had to stand by tamely and see England take to herself Cyprus; Austria, Bosnia and Herzegovina; France, Tunis. Time will decide whether these "clean hands" were not worth more than the "dirty hands" of Abyssinian soil. It is certain

that the glorious records of Rome and Carthage, ever evoked in Italy, thanks to that classical basis of education of which we spoke above, led to the ultimate fall of Cairoli. After the French occupation of Tunis the fault-finding with Cairoli's policy became more loud and universal; as a minister he grew unpopular. He therefore saw it was time to resign, and did so rather than make explanations which would have further embittered the feeling between the two countries; but he is reported to have remarked to the French ambassador, the day before he left office, that he was the last Italian minister who could be friendly to France—a prophecy that so far has proved most true.

Cairoli belonged to the party which, had it been theirs to choose, would have established Italy on a republican basis. With their leader Mazzini, however, they wisely held that "no one has the right to substitute his own will or that of his section to the national will," and the national will was that Victor Emmanuel should hold the reins—a wise decision, for Italy was neither then, nor is yet, ripe for the self-government and self-control that a true republic requires. Cairoli above all things longed for the eventual acquisition of the Trentino and Trieste. It was on this account that he and his friends accorded little importance to the colonial question. Nay, they even combated ambitious colonial aspirations. That was the reason too why they dreamed of a friendly understanding with France and Russia, that these nations might help them to oppose an eventual war against Austria and Germany. A pronounced Republican until 1860, Cairoli was faithful to death to King Humbert, whose life he saved when the assassin Passanante sprang at the monarch with his dagger. Cairoli leant forward and received the blow in his own breast. Fortunately it did not prove mortal. As a Lombard he naturally detested the Austrians under whose oppressive rule he had been born and reared, and it was equally natural that the thought of a French "revenge" and the conquest of the Trentino and Trieste should seem to his eyes twin aspirations. Undoubtedly the character of his policy made it bristle with perils. England, who could not willingly see an Italo-Russian accord, was hostile to it; the same was the case with Bismarck, who looked with evil eye on an Italo-French understanding. In consequence Cairoli had to fall, and this notwithstanding that he represented the most intimate national aspirations. His thoughts and hopes have remained the legacy of the extreme Left parliamentary party, a party of whom we shall have to speak shortly.

### PASQUALE STANISLAO MANCINI.

Pasquale Stanislao Mancini, who also has recently joined the great majority, on succeeding Cairoli as Prime Minister absolutely changed the whole direction and nature of Italian politics. For the better? That the future can alone decide. Thoughtful men are inclined to negative the question.

As every one knows, in order to give certain guarantees to England Italy was drawn into the doubtfully fortunate business of Massaua, where Russia was at the time preparing to place her foot. Mancini also brought about the famous visit of King Humbert to Vienna, which signalised the first step towards the Triple Alliance—the alliance that guarantees peace it is true, but an armed peace, a terrible peace, a costly peace, and one which strains to the uttermost the Italian resources. It was in consequence of Mancini's policy too that there arose that tension with the French Republic which has been so detrimental to the commercial well-being of both nations, especially to the poorest—namely, Italy. Mancini was rather a great jurist than a great statesman, and his name will be remembered for some brilliant studies made in juridical science, rather than for the policy which he inaugurated. With his name we close the record of the leading statesmen of the governing party in Italy, and will now pass on to speak of the minor lights.

## As in a Glass.

DEAR, hast thou ever learned to thy surprise
On entering a chamber mirror-lined,
That all the friends thou didst appear to find
Were but thyself reflected several wise?
The room seemed full to unaccustomed eyes
Whilst thou wert there; but when thou wert inclined
To leave it, nothing then remained behind
But emptiness, proportioned to its size.
So if thou lookest in my heart, dear Love,
Such overflowing fullness wilt thou see
That thou shalt seek a vacant spot in vain:
But on a close inspection it will prove
To be completely filled with naught but thee—
And wert thou gone, then nothing would remain.

ELLEN THORNEYCROFT FOWLER.

# THE STORY OF THE ENGLISH SHIRES.

BY THE REV. CANON CREIGHTON, PROFESSOR OF ECCLESIASTICAL HISTORY IN THE UNIVERSITY OF CAMBRIDGE

## HUNTINGDON.

ST. IVES' BRIDGE.

IT seems strange to look upon Huntingdonshire of to-day as a seaside county ; but such almost was the original position of its eastern border. The Ouse ran sluggishly into a huge tract of fenland which faded imperceptibly into the waters of the sea ; and what we now call the Wash reached, with scattered islands here and there, in a shallow flood, to the rising ground on which stands the town of Huntingdon. The Roman road, the Ermine street, which ran from London to Lincoln, skirted the border of the Fenland ; and what was in early times the mouth of the Ouse was guarded by the Roman station of Durolipons. Southwards, the Cam was guarded in like manner by a station at Camboritum, the modern Cambridge ; and between Camboritum and Durolipons ran another road, the Via Devana. These roads and stations were erected for the defence of the eastern coast, which was an object of great care to the Romans ; for the longboats of the Saxon pirates penetrated the shallow waters, and the marauders could choose their own landing-place. They came at first as man-hunters, carrying off men, women, and children, whom they sold as slaves. It was the duty of a special officer, "the Count of the Saxon shore," to provide for the safety of the eastern and southern coast of Britain. Moreover, the Romans saw the need of protecting the Fenland from the damage wrought by floods, and set the example of those great drainage works by which the lands and the Wash have been reclaimed. At Ramsey there are still traces of a Roman drain, to catch the rainfall and so protect the higher ground from the encroachment of the water.

When the Romans withdrew from Britain their works were abandoned ; and the pirates gradually began to come as settlers, first taking possession of the islands in the Fens. The body of English who chose this district for their prey were called the Gyrwas. One division of them, the North Gyrwas, directed their efforts against the valley of the Witham; another division, the South Gyrwas, were at work along the line of the Ouse and the Cam. For some time the Britons successfully withstood them, and they were confined to the islands of the Fenland. Gradually they succeeded in occupying the lines of the Roman road, and destroyed its stations, reducing Durolipons to a heap of ruins. Then they formed a kingdom of the South Gyrwas, which embraced the district of Huntingdonshire and Cambridgeshire. The kingdom was shortlived, but it left its traces on subsequent history, for till

the seventeenth century there was but one sheriff for the two counties, and he was chosen in alternate years from Huntingdonshire, Cambridgeshire, and the Isle of Ely. We need not follow the struggles for supremacy among the English kingdoms. It is enough to say that early in the seventh century the lands of the Gyrwas formed part of the Mercian kingdom which extended over the whole of Mid-Britain.

The district in itself was not of great value for settlers, as the rising ground around the Wash was covered with a dense forest; and as soon as Christianity prevailed in the Mercian kingdom, it was natural that the country should be handed over to the care of missionary monks whose houses were established in the seventh century at Medesham, which afterwards took the name of Peterborough, at Ely, and soon afterwards at Crowland. The story of the activity of these early monks will be told elsewhere, for none of their houses lay within the boundary of Huntingdonshire. But we see traces of their influence in the name of Godmanchester, which was given to the town which rose upon the ruins of the Roman station of Durolipons; while we recognise the ordinary pursuits of the inhabitants in the name given to the settlement on the opposite bank of the Ouse, the Hunter's Down, or Huntingdon.

But monks and people were alike overwhelmed in a common calamity when in 870 the heathen Danes bore downwards from the north. The monks were slain, and their monasteries were reduced to ashes. The whole of Eastern England passed under the Danish yoke. Still, the country south of the Nen did not attract the conquerors to make many settlements, and probably their rule did not much affect the dwellers in the southern part of their dominion. For military purposes they raised a mound at Huntingdon, and set in it soldiers to guard the line of the Ouse. But the English power slowly reasserted itself under Edward, son of Alfred the Great, who made his way along the valley of the Ouse, and in 921 succeeded in capturing Huntingdon and wresting the Fenland from the Danes. Edward still further strengthened the defences of Huntingdon, and the earthwork which still rises above the river was his work. In the reorganisation which followed upon the reconquest of the Mercian kingdom, the district which lay around the royal castle of Huntingdon was made into a shire, and took its name from its chief town.

Side by side with this reorganisation went the restoration of old institutions. The monasteries of Peterborough, Ely, and Crowland were rebuilt, and again filled with monks. The tenth century was a time of monastic revival in England, and Huntingdonshire for the first time received a monastery of its own. At the suggestion of Oswald, Bishop of Worcester, a lord named Ethelwin founded in 967 a religious house on an island which lay just on the verge of the Fenland. It was called Ramsey, or "the Ram's Island," from a solitary ram which was found there. The island, about two miles long, and not quite so wide, was covered by a mass of tangled brushwood, amidst which rose the monastic buildings and the church. The monks soon cleared their little domain, and set an example of useful industry in agriculture. Benefactions soon flowed in upon them, and they found means to attract popular attention. On one of their manors, at a place called Slepe, a few miles below Huntingdon on the Ouse, one of their villeins while ploughing turned up a skeleton. The monks of Ramsey identified it as the body of Ivo, a Persian bishop, who in the early part of the seventh century had come as a missionary to England. The relics were carried to Ramsey, and a priory was built upon the spot where they had been discovered. The growing town which clustered round the priory changed its old name of Slepe into St. Ives. Nor was this the only change of name which showed the force of the influence of the Church in the shire. Higher up the Ouse the town which bore the name of Enolfsbury in remembrance of its original settler, received the bones of a Cornish hermit, and changed its old name into St. Neots. The treasure, however, was regarded as too precious for so small a church, and the relics were translated to Crowland.

But though it was the mission of the Church to civilise, it remained for the State to govern; and the difficulties which were experienced in this task, when national unity was imperfect, led to the setting up of ealdormen over different portions. At the end of the tenth century Huntingdonshire was part of the ealdormanry of East Anglia, and its history is interesting as showing the growth of territorial lordships. The new office of earl was introduced under Canute, and in the reign of Edward the Confessor the earldom of Huntingdon was given to Siward, Earl of Northumberland, for the purpose of maintaining an equal balance between the northern earls and the house of Godwin. Siward's son, Waltheof, was the one great Englishman who kept his lands and office after the Norman Conquest, and to make sure of his loyalty William gave him the hand of his niece Judith. But Waltheof listened to the talk of some of the Norman barons who wished to rid themselves of William's strong hand over them; and though Waltheof repented, William did not forgive him. The last great English earl was beheaded in 1076, and the earldom of Huntingdon passed to his wife Judith. William ordered her to marry one of his trusty followers, Simon of Senlis; but he was lame, and she refused. But William would not alter his plans to suit a woman's whim, so he gave Judith's daughter Matilda to Simon, who became Earl of Huntingdon by right of his wife. Moreover, after Simon's death, his widow married David of Scotland, son of the Scottish king; and through this marriage the earldom of Huntingdon passed to the royal house of Scotland. It would be a long matter to trace in detail the various incidents of this connexion. It is enough to say that the Scottish king thereby became an English baron and drew a considerable revenue from his English estates; while the English king was not sorry to count him amongst his vassals and have a hold over lands situated in the middle of England which he could regard as a pledge of the Scottish king's good behaviour. Thus Stephen confiscated the earldom and bestowed it on the son of Simon of Senlis. It was again restored and again taken

away, till it finally reverted to the Crown on the death of its last Scottish holder without issue, in 1237. However, one result of this policy was that the Castle of Huntingdon was alternately held in the name of the Senlis family and in the name of the Scottish king. The adherents of the dispossessed party were constantly on the alert, and the condition of Huntingdon and its neighbourhood cannot have been very peaceful. The English king did not wish that the Scots should hold a fortress in the heart of his kingdom, and the castle was destroyed in the reign of Henry II. Its stones rapidly disappeared, and nothing remains but the original earthwork of the days of Edward the Elder.

KIMBOLTON CASTLE, FROM THE WARREN SPINNEY.

The earldom of Huntingdon was long kept in abeyance, and when it was revived in the middle of the fourteenth century, it did not bring a resident noble into the shire. The county was not connected with any stirring events in English history, and profited by its lack of notoriety. The Abbot of Ramsey was the most influential personage, and had to maintain the rights of his house against the aggressions both of his lay and his monastic neighbours. Dykes and causeways were erected across the fens; but no regular scheme of drainage was carried out, and Huntingdonshire was at the mercy of those who dwelt nearer the Wash. If they neglected to clear their drains the county was flooded. However, in spite of difficulties the county flourished. Its forests were cleared, and the need for timber in the Fenland provided a ready market for the wood, which could easily be carried by water. The cleared land was soon converted into excellent pasturage, and the sheep of Huntingdonshire were almost as famous as those of Leicestershire.

This peaceful state of things came to an end with the dissolution of the monasteries; and the monks of Ramsey seem to have felt that they had done their work and their presence was no longer needed. They were good, quiet men, of whom no one had much harm to say; and the report of the commissioner sent to examine into their doings was that "they live as uprightly as any other, after the best sort of living that hath been among religious folk this many years; that is to say, more given to ceremonies than is necessary." That was precisely the objection felt against the existence of the monasteries. In early days they had discharged many useful offices, and had fostered civilisation in many ways. Their religious life was the background to a life of practical beneficence. They had set the example of peaceful industry and had afforded a refuge to the folk who dwelt around them. But times had changed, and the monks of Ramsey were no longer pioneers. Their lands were tilled for them, and they were a body of kindly landlords who lived a harmless but not a very elevated life. The Abbot of Ramsey saw no good reason why his monastery should continue to exist, but declared himself "conformable to everything that shall be at this time put in use." He took care, however, to make a good bargain for himself, for he was pensioned off with £230 a year, worth at least ten times as much in our money, besides a house for his use, a hundred loads of wood, and a mark of swans every year. A "mark of swans" meant the right of pasturing swans on the fens; as they fed in common, each owner distinguished his flock by a mark which was cut upon the bill of the bird.

The fall of the monasteries was closely con-

nected with the fate of Henry VIII's unhappy queen, Catharine, who ended her days in Huntingdonshire. At first, upon her exclusion from Court, she was sent to a manor-house of the Bishop of Lincoln at Buckden, and thence to the royal manor of Kimbolton which formed part of her jointure, where she died, greatly to her husband's relief, early in 1536. Kimbolton was granted by the king, after her death, to an official who had done him good service, Sir Richard Wingfield, from whose family it passed by sale to Henry Montagu, who, in 1603, was created Earl of Manchester. The fall of the monasteries led more directly to the rise of another family, whose

HINCHINBROOK HOUSE, HUNTINGDON.

connexion with Huntingdonshire must always form the chief feature in the county's history. Morgan Williams, a Welshman from Glamorganshire, married a sister of Thomas Cromwell, who was Henry VIII's great agent in carrying out the business of the monastic suppression. Morgan's son, Richard, rose in fortunes by Cromwell's protection, and was rewarded for his services to the king by some of the monastic lands in Huntingdonshire, amongst others the sites of Ramsey Abbey, and of Hinchinbrook Priory, a Benedictine nunnery which rose on a slight eminence outside the town of Huntingdon. His eldest son, Henry, built a noble mansion at Hinchinbrook, where he entertained Queen Elizabeth in 1564, and became one of the chief men of the shire, where, from his liberality, he was known as "The Golden Knight." This taste for lavish expenditure was inherited by his son, Sir Oliver, who distinguished himself by a magnificent entertainment given to James I in 1603. But he pursued his taste for magnificence till he sorely crippled his resources, and in 1627 sold Hinchinbrook to a younger brother of the Earl of Manchester; and thus the chief place in the shire passed to the Montagus.

However, the Cromwell stock was sturdy, and many of the younger sons lived in the eastern counties farming their estates. A brother of Sir Oliver, Robert Cromwell, inherited a small estate near Huntingdon, where he lived. There was born his son, Oliver, who was to play so large a part in English history; and there he was educated in the little grammar school, held in the buildings which had once belonged to the Hospital of St. John. In 1628 Oliver Cromwell first entered upon public life as member for the borough of Huntingdon. In 1631 he sold his estate at Huntingdon and removed to St. Ives, where he farmed as a tenant farmer. Thus it was the protestant associations, the puritan education, and the quiet life of Huntingdonshire which formed the resolute character of him who, at a crisis of his country's fate, showed that he possessed the seeing eye and the strong grasp of principle which enabled him to act with decision.

But if the quiet of Huntingdonshire was favourable to the development of a strong man, it equally afforded a retreat to another who sought to withdraw from the perplexities of active life. Few episodes in the life of England during the seventeenth century are more interesting than is the settlement of Nicolas Ferrar at Little Gidding. Ferrar was a man of cultivated mind, the son of a wealthy London merchant, who had at his command a distinguished career both in commerce and in politics. But his fastidious nature shrank from the antagonisms which he saw on every side. He withdrew from politics, wound up his business, and bought the manor of Little Gidding as a fit place for retirement to one who wished to spend his life in meditation and the practices of devotion. He found there in 1624 a ruined manor-house, a shepherd's hut, and a church used as a barn. Before he would repair his house he rescued the church from desecration, and was ordained deacon that he might officiate. His mother, his brother, his brother-in-law and their families accompanied him; and a family life was organised on the basis of simple piety and devotion. The children were carefully educated, and neighbouring children were welcome to share in their education. Daily services were said in the church, and a strict rule of useful occupation and devotional observances was established. Men thought that the old days of monasticism were being revived, and mocked at this "protestant nunnery," but Ferrar had no design of founding an order, and did not aim at being a leader of men. Ferrar died in 1637, but the family community still continued, and in 1642 Charles I solaced himself by a hurried visit. The storm of the Civil War swept it away in 1647, and not till our own times did the memories of Ferrar again begin to cluster round the church which he had so carefully restored.

When the Civil War broke out Huntingdonshire joined the Association of the Eastern Counties, which was formed for the purpose of keeping the war outside their borders, and of raising troops for Parliament. Oliver Cromwell was the heart and soul of this organisation, which he converted into the mainstay of the Parliamentary cause. But Oliver had much to do before he could reduce to obedience many of his old friends and kinsfolk. He visited his uncle Sir Oliver at Ramsey, and begged his blessing, but he took the precaution of carrying off the arms and plate of the old man, who remained a royalist till the end. But with both Cromwell and the Earl of Manchester on the side of Parliament, the allegiance of Huntingdonshire was secure, and the county was not disturbed by warfare within its borders.

GRAMMAR SCHOOL AT HUNTINGDON.

The family of Cromwell was not perpetuated in Huntingdonshire; but the Montagus, both those of Kimbolton and those of Hinchinbrook, took a great part in forwarding the Restoration. Sir Edward Montagu of Hinchinbrook was created Earl of Sandwich in 1660, and was a famous admiral, dying at sea in an engagement with the Dutch. The Montagus played a considerable part in English history, and in Huntingdonshire did much to further agriculture. For from this period onward the records of the county have little to tell save a steady progress in good farming. The drainage of the Fenland, which was seriously undertaken in the end of the seventeenth century, greatly changed the whole aspect of the shire. In the first place, it meant that the Wash retreated; and consequently Huntingdon lost its communication with the sea, and ceased to be a place for the import and distribution of com-

modities. This led to a gradual decline in the importance of the town; and Huntingdon, which in old times had fifteen parish churches, now only possesses three. At the same time the lands of the county did not gain so much advantage from the drainage as did those which were newly reclaimed. For the new works were calculated for the benefit of the low-lying tract round the Wash, and it was some time before the connecting drains from the more inland districts were adjusted to the new conditions. When this was done Huntingdonshire could claim to be the best grazing land in England. Early in the eighteenth century Defoe wrote of it, "Here are the most beautiful meadows on the banks of the River Ouse that I think are to be seen in England: which, in the summer season, are covered with innumerable herds of cattle and flocks of sheep."

Defoe's description is still characteristic of the great charm of Huntingdonshire. It is a county wholly given over to pastoral life. There are no great towns and few traces of industrial occupations. Huntingdon, St. Ives, and St. Neots are simply centres of the agriculture of the neighbourhood, and breathe an air of quietness and peace. Population is distributed over many villages, which nestle among the trees and break the monotony of the rich meadows which surround them on every side. The causeways on which many of the high roads still run remind us of the days, not very far distant, when the land was still exposed to floods; and the bridges at Huntingdon and St. Ives rank high as examples of the architecture of the past. The bridge at St. Ives still retains the old bridge-chapel, now converted into a house, which testifies to the sense of our ancestors of the perils of a journey. Everywhere there are traces of old-world life. The traveller feels that he is in Cromwell's country, in the land where a sober discharge of daily duties taught one of England's greatest heroes to understand the spirit of the nation's past, and form a clear conception of its future mission.

## THE JOURNAL OF SIR WALTER SCOTT.

IT is nearly sixty years since Sir Walter Scott died, and now the Journal from which Lockhart gave many interesting extracts in his admirable biography is published without abridgment. It is a wonderful book, the most pathetic work of a great master of pathos, and a beautiful revelation of a character more worthy perhaps of study than the author's finest works. Scott was never so great as in the years of adversity and pain of which he takes count in these pages, but apart from his splendid gifts as a poet and imaginative writer, and in spite of some obvious failings, there was never a time in which he did not merit the unbounded love and honour he received. No one conscious of great powers could have been more humble than Scott, more free from vanity and from the petty jealousies which so often beset men of letters. Imagination did not lead him astray, as it has led men of weaker fibre; for his sense of duty was strong, and so were his affections. He was one of the most lovable of men because he sought to find in everybody something worthy of his love and sympathy, but his large-heartedness was combined with indomitable energy and the most masculine understanding. No one could take any liberties with the "Sheriff"; but the poorest people on his estate at Abbotsford learned to love him, and one of them said: "Sir Walter talks to us as if we were blood relations." His nature was indeed largely sympathetic. "If God bears with the very worst of us," he writes, "we may surely endure each other," a saying that may remind some of my readers of the beautiful Jewish legend with which Jeremy Taylor concludes his great work "The Liberty of Prophesying." As the story is very brief, the digression may be pardoned. Abraham, it is said, had hospitably entertained a very old man who came to his tent weary with age and travel, but on finding that he did not worship the God of Heaven, he thrust him out "to all the evils of the night." Then God called to Abraham and asked him where the stranger was, and the patriarch told what he had done. "God answered him, 'I have suffered him these hundred years although he dishonoured Me, and couldst thou not endure him one night when he gave thee no trouble?' Upon this, saith the story, Abraham fetched him back again and gave him hospitable entertainment and wise instruction."

Scott kept his feelings sternly under restraint, and perhaps wisely, for his heart was as tender as a woman's. Despite thirty years of happy married life, the remembrance of an early and lost love haunted him to the last; and of this great man's filial affection a beautiful illustration is related by his biographer.

> Perhaps the most touching evidence of his early domestic feelings was exhibited to his executors when they opened his repositories in search of his testament the evening after his burial. On lifting up his desk we found arranged in careful order a series of little objects which had obviously been so placed there that his eye might rest on them every morning before he began his tasks. These were the old-fashioned boxes that had garnished his mother's toilette, when he, a sickly child, slept in her dressing-room; the silver taper-stand which the young advocate had bought for her with his first five-guinea fee; a row of small packets inscribed with her hand, and containing the hair of those of her offspring that had died before her; his father's snuff-box and étui-case, and more things of the like sort recalling "the old familiar faces." The same feeling was apparent in all the arrangements of his private apartment. Pictures of his father and mother were the only ones in his dressing-room. . . . Even his father's rickety washing-stand, with all its cramped appurtenances, though exceedingly unlike what a man of his very scrupulous habits would have selected in these days, kept its ground

It is not our purpose here to tell once more the story of Sir Walter's life, but there are several passages in it that it will be well to mention before we come to the days of darkness recorded in the Journal. This "wondrous Potentate," as Wordsworth called him, was for many a long year one of the happiest, the busiest, and the most prosperous of men. And we may add that no one was less injured by prosperity. With a brain teeming with imagination, and a spirit that exulted in its strength, he regarded labour as the charter of existence, and submitted with goodwill to the drudgery of the law. For six and twenty years as Clerk of Session he was at his post for hours daily when the courts were sitting at Edinburgh. Never to be doing nothing was one of Scott's mottoes, and he was as active in the pursuit of recreation as of work. He was a daring rider, a stout player at single-stick, and in spite of lameness a "desperate climber." Spartan-like, he taught his children to laugh at danger.

In his early days there was nothing that Scott loved better than to ramble over the Border country, making friendly acquaintance with the people, and storing up in his wonderful memory the old legends and ballads of which he made such good use in after years. The publication of the "Border Minstrelsy," with the introduction and notes, was the first feather in Scott's cap as a poet and man of letters. Then came "The Lay of the Last Minstrel," a poem which took the world by storm by its freshness and originality, and by its vigorous rush of verse. This was followed by "Marmion," for which he received 1,000 guineas before the poem was published; and three years later appeared "The Lady of the Lake," which put upwards of 2,000 guineas into the poet's purse, and may be said to have opened Scotland to English tourists. It is not Scott's finest work as a poet, but no poem ever aroused more passionate enthusiasm. Swarms of visitors hurried to Loch Katrine, and "the post-horse duty in Scotland rose in an extraordinary degree, and continued to do so for a number of years."

The enthusiasm of the public did not dazzle Scott, who wrote afterwards that never, even when it was in the highest fashion with the million, had he been a partisan of his own poetry. "The Lord of the Isles" and "Rokeby" completed his crowning achievements in verse, and then thinking, with his usual modesty, that his poetical sun had set, he turned to prose.

The earliest hours of the morning were given to his desk, and by the breakfast hour he had done enough, as he said expressively, "to break the neck of the day's work." Then by one o'clock, when he was his own master, and the courts were not sitting, he would mount his horse and ride out with his hounds, whom he treated as friends. He was a gentleman, we are told, even to his dogs, and when one of his favourites died he declined an invitation to dinner, previously accepted, on the ground that he had lost "an old friend."

The amount of prose writing and editing Scott achieved in a few years when in the full vigour of manhood was enormous, but no literary toil was ever allowed to banish wife or children from his study or to interfere with the homely duties of life and with the claims of society. To keep, he said, in the course and stream of daily life is a great advantage to a literary man.

The most brilliant period of Scott's career lay between the years 1814 and 1825, for in those years he poured forth with startling rapidity a series of the noblest prose fictions which the world has seen. Meanwhile he was lord of Abbotsford and "the whole world's darling." The secret of the authorship of the Waverley Novels was faithfully kept for years, but friends who knew Scott familiarly felt that there was but one man in Scotland who could have written them. The "Great Unknown" gained a reputation which he would not acknowledge, and wherever he travelled was welcomed with the enthusiasm generally given to a conqueror. And a conqueror Sir Walter was, not only in a poetical sense through the exercise of his splendid imagination, but because, as Mr. Palgrave has pointed out, he entirely removed the antagonism which had previously existed between the Saxon and the Gael. "This," he writes, "may be regarded on the whole as his greatest achievement. He united the sympathies of two hostile races by the sheer force of genius. He healed the bitterness of centuries."

Through the years in which Scott reached the high-water mark of his prosperity, he gained a princely fortune and kept open house at Abbotsford, a mansion now visited by pilgrims from every quarter of the civilised world. It was Scott's ambition and his weakness to found a family, and the creatures of his imagination were of less account in his eyes than the prospect of creating a new branch of the clan of Scott. This seems like an ignoble ambition, but it was not wholly so, for it was caused, in great measure, by a reverence for old institutions and for family ties. The simplicity and manliness of his character were never injured by this illusion, but it led him into commercial speculations that ended in the ruin of these worldly hopes. How his fortunes were wrecked cannot be told here, and is probably familiar to our readers. Enough to say that the prospect of ruin stared Sir Walter in the face very shortly after the opening of his Journal, which begins on November 20, 1825, and ends on April 16, 1832.

And now let us open these deeply interesting volumes and see how bravely the writer battled with a stormy sea. In the month of January 1826 Scott, who was then in his fifty-sixth year, learnt that he was a ruined man, with obligations that amounted to about £130,000.

"Naked we entered the world," he writes, "and naked we leave it—blessed be the name of the Lord! I feel neither dishonoured nor broken down by the bad—now really bad news I have received. I have walked my last on the domains I have planted, sate the last time in the halls I have built. But death would have taken them from me if misfortune had spared them. My poor people whom I loved so well!"

His resolve was instantly made. He would put forth all his strength and, if life were spared, pay his creditors in full. This noble purpose was

achieved after Sir Walter's death, but it was at the cost of his life. His steady flow of industry, so far from being lessened by this terrible disaster, was stimulated by it, and he worked on with undaunted courage until the brain was exhausted and the pen fell from his hand.

"When sorrows come, they come not single spies, but in battalions," and this saying of Shakespeare was but too true in Scott's case. Not long after the great blow to his fortunes, Lady Scott, who had suffered long from illness, lay dying at Abbotsford at the time when her husband was forced by his official duties to leave for Edinburgh. Five days afterwards the end came. Scott felt the loss in the very depths of his being. After some days he writes: "I do not know what other folks feel, but with me the hysterical passion that impels tears is of terrible violence, a sort of throttling sensation, then succeeded by a state of dreamy stupidity in which I ask if my poor Charlotte can actually be dead. I think I feel my loss more than at the first blow."

Later on, when the fresh sadness of the loss was over, he writes:

"In the evening we had music from the girls, and the voices of the harp and viol were heard in my halls once more, which have been so long deprived of mirth. It is with a mixed sensation I hear these sounds. I look on my children and am happy; and yet every now and then a pang shoots across my breast. It seems so strange that my poor wife should not be there."

The allusions to his loss are frequent, and all the more touching since Scott's stoicism demanded the suppression of feeling. At the same time his bodily strength was failing. After a hard day's work on the "Life of Napoleon" he writes, "My head aches, my eyes ache, my back aches, so does my breast, and I am sure my heart aches: and what can Duty ask more?" Duty, however, in Scott's judgment did ask more, and was ever urging him to unparalleled exertions. In two years he earned for his creditors by the labours of his pen very nearly £40,000. "Woodstock" produced £8,000, and the "Life of Napoleon" in nine volumes, the most laborious work he ever undertook, brought in £18,000. "It was," says Lockhart, "the work of one twelvemonth, done in the midst of pain, sorrow, and ruin." This was the man who could write, "When did I ever like labour of any kind?"

And now in addition to other labours Sir Walter began to write his "Tales of a Grandfather," one of the most charming books that came even from his magical pen. These historical tales, the delight of children and also of their elders, were received with more enthusiasm than any one of his books since "Ivanhoe." He himself thought the work well done, and wrote in his Journal that he "would as soon compose histories for boys and girls which may be useful, as fictions for children of a larger growth." It was seldom that he thought well of his own writings. On this score it is stated that he was not only inaccessible to compliments but even insensible to the truth. He disliked to hear his books praised or talked about, but learning upon one occasion that Dr. Chalmers had expressed his admiration of his works, he said, "To have produced any effect upon the mind of such a man as Dr Chalmers is indeed something to be proud of. Dr Chalmers is a man of the truest genius. I will thank you to repeat all you can recollect on the subject."

The "Tales of a Grandfather" Scott appears to have retained in his own hands. "If I work," he writes, "to the amount of £10,000 a year for the creditors, I think I may gain a few hundreds for my own family at by-hours." In the spring of 1828 he took his daughter Anne to London, for he was longing to see his boys and Lockhart and Sophia and the darling grandson to whom he had dedicated the "Tales." The poor child had given many a pang to Scott, for his life seemed to hang upon a thread, and there are few things more pathetic in the Journal than the references to this engaging boy who died a few months before his grandfather.

Something may be said about this London journey, which was not, sixty years since, the cheap and easy matter it is nowadays. The travellers slept the first night at Carlisle, "a sad place," Scott writes, "in my domestic remembrances, since here I married my poor Charlotte. She is gone and I am following faster perhaps than I wot of. It is something to have lived and loved; and our poor children are so hopeful and affectionate that it chastens the sadness attending the thoughts of our separation." After visiting among other places Warwick, Leamington, and Stratford-on-Avon, Scott and his daughter reached London in six days, and "had a joyful meeting, I promise you." "I looked into my cash," he writes, "and found £53 had diminished on the journey down to about £3. In former days a journey to London cost about £30 or thirty guineas. It may now cost one-fourth more. But I own I like to pay postilions and waiters rather more liberally than perhaps is right. I hate grumbling and sour faces."

Had Mrs. Lockhart read the Journal, she would probably have objected to her father's comments on her youngest infant. "My name-son, a bright and blue-eyed rogue, with flaxen hair, screams and laughs like an April morning; and the baby is that species of dough which is called a fine baby. I care not for children till they care a little for me."

During Scott's visit Mrs. Lockhart had to take her "poor little Johnnie" to Brighton, and Anne Scott accompanied her sister. This saddened the London sojourn, and ultimately he was left alone with his younger son Charles, then a clerk in the Foreign Office. "And this is the promised meeting of my household!" is Sir Walter's melancholy comment. However, he remained in London for some time, going everywhere, and seeing all the great personages of the day, from poets to princes.

Now he breakfasts with Rogers, now dines with the Duke of Wellington, and now "with Mr. Peel—a great Cabinet affair, and too dignified to be very amusing." Then he is entertained at that home of literary lions, Holland House, or sits to Haydon for his portrait, or breakfasts at Somerset House on tea and coffee and bread-and-butter, "which is poor work;" and Scott thinks that a slice of ham, some broiled fish, or a mutton chop "would have been becoming so learned a body" as the Royal Society. Every day brought its invitation, and Scott records how, on one of these

busy days, he dined, by command, with the Duchess of Kent.

I was presented to the little Princess Victoria—I hope they will change her name—the heir-apparent to the crown as things now stand. The little lady is educated with much care, and watched so closely by the Duchess and the principal governess that no busy maid has a moment to whisper, "You are heir of England." I suspect if we could dissect the little head, we should find that some pigeon or other bird of the air had carried the matter.

Then Sir Walter went to Brighton in a coach which performed the distance in six hours, and was happy to find himself "at Sophia's quiet table, and am only sorry that I must quit her so soon."

Father and daughter returned to London together, and the gay metropolis—it was then the height of the season—gave him once more the welcome he deserved. It contained at that time a "nest of singing birds," including, in addition to the Wizard of the North, Wordsworth and Coleridge, Southey, Rogers, and Moore. On leaving London Scott sums up under nine headings the advantages of the trip. It is characteristic of the writer that of these, six are services rendered to other people. Even in his worst straits we find him thinking and labouring for others. "There would be little gain," he says, "in doing a kind act if you did not suffer pain or inconvenience upon the score."

The reader will already have observed that one of Scott's first thoughts at the news of his commercial failure was for his "poor people," and it is pleasant to know that in this fall of his fortunes his servants declined to leave so good a master. Lockhart relates that the butler, instead of being the easy chief of a large establishment, was willing to do half the work of the house at probably half his former wages, and that old Peter, his coachman of five and twenty years' standing, became ploughman in ordinary, "and so on with all that remained of the ancient train, and all seemed happier." One old labourer on the estate when he heard of Scott's misfortunes "went to bed and said he would not rise again, and kept his word."

Writing in Edinburgh Sir Walter says, "I shall be glad to be at Abbotsford to get rid of this town, where I have not in the proper and social sense of the word a single friend whose company pleases me. In the country I have always Tom Purdie." Tom's first introduction to the Sheriff was as a prisoner charged with poaching. Scott detected the good qualities of the man and made him his shepherd. Then he was promoted and became his master's forester and constant companion in the woods of Abbotsford. Always at hand when Scott wanted an arm to lean on, he would also find his way into the splendid library in his ploughman's garb and see that the books were in good order. He used to talk of his master's works as "our books," and said the reading of them was the greatest comfort to him, "for whenever he was off his sleep, which sometimes happened, he had only to take one of the novels, and before he read two pages it was sure to set him asleep." Tom died suddenly in the days when the comfort of his help was most needed, and Scott wrote, "There is a heart cold that loved me well, and I am sure thought of my interest more than of his own. I have seldom been so much shocked."

The tremendous strain upon brain and heart were fast telling upon Sir Walter, and the Journal makes many a sad disclosure of physical and mental suffering. He complains of violent rheumatic headaches, and that the joints of his knees are so stiff and painful in rising and sitting down that he can hardly help screaming. "I am very ill to-day," he writes, "with a rheumatic headache and a still more vile hypochondriacal affection which fills my head with pain, my heart with sadness, and my eyes with tears. It is a most hang-dog cast of feeling, but it may be chased away by study or by exercise. The last I have always found most successful, but the first is most convenient. I wrought, therefore, and endured all this forenoon." The lameness which he suffered and laughed at in youth gave him intense pain at times, but there were graver evils to be borne, and in February 1830 he had a fit which for a short time deprived him of the power of speech. Later on in the same year he records that he sank stupefied on the floor. One bad symptom after another is noted in the Journal, and still Sir Walter toiled on with an iron will that no physical suffering could subdue. "I will never," he had written, "relax my labour in these affairs either for fear of pain or love of life. I will die a free man, if hard working will do it."

His latest tale, "Count Robert of Paris," showed the failure of his wonderful imagination, and Scott was keenly conscious of the loss.

I have suffered terribly, that is the truth, rather in body than in mind, and I often wish I could lie down and sleep without waking. But I will fight it out if I can. It would argue too great an attachment of consequence to my literary labours to sink under. Did I know how to begin, I would begin this very day, although I knew I should sink at the end. After all, this is but fear and faintness of heart, though of another kind from that which trembles at a loaded pistol. My bodily strength is terribly gone; perhaps my mental too.

In the family circle, we are told, Scott seldom spoke of his illness, and always hopefully, but in the Journal he writes of himself as "perhaps setting like a day that has been admired as a fine one: the light of it sets down amid mists and storms."

At length it was resolved to try the effect of a southern climate, and the Government placed a vessel at his disposal. Before leaving Abbotsford Sir Walter was visited by his great brother poet, Wordsworth, and the memory of that parting is beautifully recalled in "Yarrow Revisited." The fine sonnet written at the same time, "On the departure of Sir Walter Scott for Naples," is probably familiar to our readers, but the final lines may be quoted:

"Lift up your hearts, ye Mourners! for the might
Of the whole world's good wishes with him goes:
Blessings and prayers, in nobler retinue
Than sceptred king or laurelled conqueror knows,
Follow this wondrous Potentate. Be true,
Ye winds of ocean and the midland sea,
Wafting your charge to soft Parthenope."

In Italy Sir Walter Scott had occasionally flashes of his old spirit, but the change effected no real improvement; and the death at Weimar of the poet Goethe, whom he had hoped to visit on the return journey, made him eager to go home.

He had left London on September 23, 1831, and after another apoplectic fit, reached Abbotsford in a hopeless condition in July 1832. He had been in a state of complete unconsciousness, but as he approached his home he began to look about him, and when his eye caught the towers of Abbotsford it was with difficulty he could be kept in the carriage. The next morning he awoke with perfect consciousness, and was wheeled about the garden and through his rooms in a chair. "I have seen much," he said, "but nothing like my ain house—give me one turn more."

On the following day he begged Lockhart to read to him; when asked from which book, he said, "Need you ask? there is but one." He listened to the fourteenth chapter of St. John's Gospel; and when it was finished he said, "Well, this is a great comfort; I have followed you distinctly, and I feel as if I were yet to be myself again." On the morning of the day he died Sir Walter is said to have asked the nurse to read a Psalm. "She proceeded to do so, when he gently interposed, saying, 'No, no, the Scotch Psalms.' After reading to him a little while he expressed a wish to be moved nearer the window, through which he looked long and earnestly up and down the valley and towards the sky, and then on the woman's face, saying, 'I'll know it all before night.'"

"About half-past one P.M., on September 21," writes his biographer and son-in-law, "Sir Walter breathed his last, in the presence of all his children. It was a beautiful day—so warm that every window was wide open—and so perfectly still, that the sound of all others most delicious to his ear, the gentle ripple of the Tweed over its pebbles, was distinctly audible as we knelt around the bed, and his eldest son kissed and closed his eyes."

JOHN DENNIS.

## Twilight.

THE mystic twilight shrouds the dying day,
The wind sobs through the rain,
Which falls like human tears that must have way,
And ceasing, flow again.

The damp and faded leaves give forth a scent
Sweet, subtle, but which blends
With Nature's woe, and adds to the lament
Of life that all life ends.

What wonder that we, too, attuned to grief,
To sadness ever prone,
Find the world's dreary aspect a relief,
And claim it for our own!

How many men and women, even as I,
Behold the day depart,
And consecrate its ending with a sigh
From an o'erburdened heart!

Ah, but God hears them, friends, our dreams He knows,
The yearning that is pain;
*He* gave the moaning to the wind that blows,
The sadness to the rain.

He gave them, too, their uses. They will bring
Rejoicing to the earth;
The flowers, the leafy boughs where glad birds sing,
The streams that laugh with mirth.

And we, whose hopes are here so incomplete,
Who vainly pine and brood,
May learn that disappointment may be sweet,
And loss our only good.

There shall be no more weeping, we are told,
Where no more there is night,
Where He shall satisfy us, and enfold,
Who is both Love and Light.

Beloved, take courage. All our sorrows here,
If we but consecrate
To Him, He will transform them. Do not fear,
But pray and trust and wait.

He who can make the harvests of the earth
From rain and sun and air,
Will, maybe, change to gems of priceless worth
Our tears, our griefs, our care.

Here, night and day He in His wisdom made,
The evening and the morn;
Here brightness flickered, light o'ercast by shade,
The twilight and the dawn.

But in our souls, whatever change betide,
If we but do the right,
God through the darkness will with us abide,
And give us always light.

IDA J. LEMON.

# REMARKABLE WINTERS IN EUROPE.

A MOMENT OF PERIL.

"WE never have anything like the old winters," say some people. Their memory must be going back to the beginning of the century, to that fearful period when Europe was decimated, and involved apparently to all time in millions of millions of debt. From 1795 to 1830 Europe had in every sense of the word "Hard Times." As the stars in their courses fought against Sisera, so the elements fought against those who commenced the fratricidal struggles, and finally against the monster which, like Frankenstein, they had called into being. This epoch opens with and concludes with extraordinarily severe winters, its central period being distinguished by two winters in succession quite terrible, and it contains no less than eleven extremely rigorous winters.

## 1794–1830.

In 1794–95 Napoleon was rising on the ruins of the French Revolution. The cold for a month during that winter reached the lowest average temperature ever recorded in Europe. There were forty-two days of continued frost. January 25 is commonly supposed to have been the coldest day ever known. The thermometer in London was 8° below zero, in Paris 10$\frac{3}{7}$°. Snowstorms lasted in Great Britain fifty-one days. On the Thames, 300 vessels were locked up in the ice. The Marne, the Scheldt, the Rhine, and the Seine were frozen so hard that regiments of soldiers and heavy carriages passed over them, and it was in consequence of this state of things that Pichegru's order to capture the Dutch fleet was effected on January 20,

exactly as a sportsman might take his prey in a trap. 1798–99 was another very severe winter on the Continent, the Meuse being passable for carriages; and the Rhine being frozen in the same hard way, dragoons crossed it at Mayence. Fairs were also held on the ice at Rotterdam and the Hague. 1802 was again a severe winter. In 1805 the Neva froze earlier than in any year since 1703. 1811 was remarkable in England for a frost so hard that in the early part of January people walked on the ice on the Thames.

As nature seemed to shudder at the downfall of human hope and the apparition of Napoleon, so as his career is coming to a close she appears in sternest mood, as if commissioned to do what all the armies in Europe could not do.

In the Museum at Lyons is a painting by Charlet depicting Napoleon's retreat from Russia after the burning of Moscow in October 1812. "Where are the officers of the staff, where the horses, the plumes, the captains, the marshals? Nothing is to be seen of the great army but the perishing soldier, nothing but human misery tramping guideless, leaderless, and without order, beneath a pitiless sky, on a solid sheet of ice. Where is the Emperor? Afar off on the horizon, enwreathed in whirls of hoary rime, his carriage perchance is rolling over heaps of corpses. A hundred thousand men, their heads on their bosoms, death in their souls, still tramp on in regular step. One after the other they drop and sink into their last sleep. Some throw up their arms in supplication, but no one heeds them, they fall, and the crowd moves on. Ravens are flying over the snow full of human corpses. The heavens are one vast ceaseless drizzle, and the rain freezes as it falls. The misery is profound, desperate!"[1]

Such was 1812–13 in Europe. 1813–14 was another terrible winter, but whereas the former seems to have been worse on the Continent, the latter was the more remarkable in England. It was ushered in by one of the very worst of London fogs. A darkness that might be felt lasted a whole week, during which people in the streets only saw each other by the red glare of a flaring link, or knew of each other's existence by the cries of alarm which rose on all sides. When the fog ceased, the snow came down in heavy falls, which at last continued without cessation for forty-eight hours. This on a ground congealed by four weeks' frost, with intensely cold northerly or north-easterly wind blowing, rendered the prospect somewhat dreary. Thaw, followed immediately by another spell of frost, in which the icicles grew a yard or a yard and a half long, made matters worse. Circulation was more and more impeded, communication between the centres of life being arrested until it almost entirely ceased. Out of London only the Essex and Kent roads were passable.

Vast quantities of ice in the Thames collected about the bridges, forming great islands, which, driven by the current or the wind, dashed against each other with fury, cracking up and crashing with a tremendous noise. Gradually this turmoil ceased and the river became still as death. By February 1, 1814, the whole waterway between Blackfriars Bridge and Three Cranes Wharf was as hard as a granite pavement. The following day a complete street had been laid out, lined on each side by shops and stalls, and called the City Road. Eight or ten printing-presses were set up, an orange-coloured standard with the Dutch motto, "Orange boven," being hoisted over one. A small sheep was roasted and its flesh sold as *Lapland mutton*, and a plentiful store of gin, beer, and gingerbread provided. Swings, bookstalls, dancing in a barge, suttlers' booths, skittles, donkey-riding, gambling, etc.—it was a complete fair. Behind this white background, studded by bits of colour here and there, St. Paul's and the City stood out against a sombre sky. The effect at moonlight was striking, and the imagination might easily have supposed it a scene in Holland or Sweden. The Frost Fair of 1814 is the subject of one of our illustrations, and the above details have been gathered from a little book called "Frostiana," printed on the ice, and published there on February 5, 1814.

The Tyne presented a like scene. On January 31 no less than seven drinking-booths were erected on the frozen river and fires ignited. A ballad of the time says :—

> "From Red Heugh down to Ouse Burn Quay
> The river's crowded like a fair,
> And many a group of people play
> At horseshoes for a quart of beer."

Indeed, all sorts of games went on, and among the frequenters of the drink-booths there was a fine field for the recruiting-sergeant. On the Tweed a party of Kelso people sat down to a dinner in the middle of the river. Over the heads flew an Orange flag and the union flags of England and Holland. No more earnest execrators of Napoleon than the Dutch, who with all Europe were at this moment eagerly hoping for his downfall. The Severn was also frozen over, and boats could not cross the Mersey for the ice. Indeed, the whole face of the country was one uniform sheet of snow, vehicles of every kind had to be left to their fate and the horses taken to the nearest place of refuge. In Warwickshire the drifts were unprecedented; at Dunchurch during many days no tracks of carriages or travellers were visible for miles round. The Cambridge coach, coming to town, sank into a hollow part of the road, where the snow drifted over it from one o'clock until nine in the morning, when it was dragged out by fourteen waggon horses, the passengers being in the coach all the time and nearly frozen to death.

While Napoleon was thinking, in January 1814, of calling out 300,000 more conscripts, the Allies pressed on to Paris, which, after a short struggle, surrendered on the 30th of March. Early the next morning the allied troops, led by the Emperor of Russia, the King of Prussia, and the Austrian General, entered the city, proceeding through the boulevards to the Champs Elysées, where they were reviewed. The Cossacks with their long-maned ponies, their bright little eyes, and wild, shaggy, irregular appearance, excited, as our picture testifies, the chief interest. White flags, for the first time during nearly a quarter of a century, were seen in the

[1] Alfred de Musset.

streets of Paris. Even the statue of Napoleon on the Column Vendôme was hidden in a white shroud. It was symbolic of the fact that a very different season had come from that when every one carried something green. A moral winter had set in, and, fitly enough, Talleyrand came to the fore, and was the representative Frenchman of the hour.

The remaining years of this period were remarkable for several other severe winters. That of 1819–20 was bitter throughout Europe, being one long spell of intense frost from November to March. Paris had forty-seven days of it, and in London the Thames at Woolwich was frozen in several places to a thickness of five feet, while at Lambeth one piece was found twelve feet thick. Loaded carts passed over the Clyde at Renfrew, and on Sunday, January 16, 1820, Edinburgh presented the appearance of a Canadian winter; snow fell densely, and was so dry as to be driven in great clouds, and accumulated in enormous wreaths at the street corners. Besides the Thames and the Seine, the Rhone, the Rhine, the Danube, the Garonne, and the lagoons of Venice were all frozen, so that it was possible to walk on the ice. At Metz, on January 10, it was so cold that a number of persons had their ears and hands frozen, and during this winter several travellers perished from the cold in France. Its severity was heralded by the passage along the Channel of a great number of birds from the most distant parts of the North Sea; among these were wild swans and ducks of variegated plumage. The winter of 1823 was also severe on the Continent, while that of 1827 was remarkable for a violent snowstorm, by which a large part of the North of England and a portion of Scotland became a trackless waste. Some of the hamlets were likened to rabbit-warrens, nothing being seen of the houses except through a hole excavated at the door.

But this period reached a climax in a winter unequalled in its extreme length. The Seine was frozen from December 28, 1829, to January 26, 1830, and again from February 5 to February 10 —in all thirty-four days; the like had not occurred since 1763. All the other rivers in France were frozen. Even at Havre the Seine was frozen, and at Rouen a fair was held on the ice, while at Choisy the bridge was blocked by an ice wall sixteen and a half feet high.

### 1490–1591.

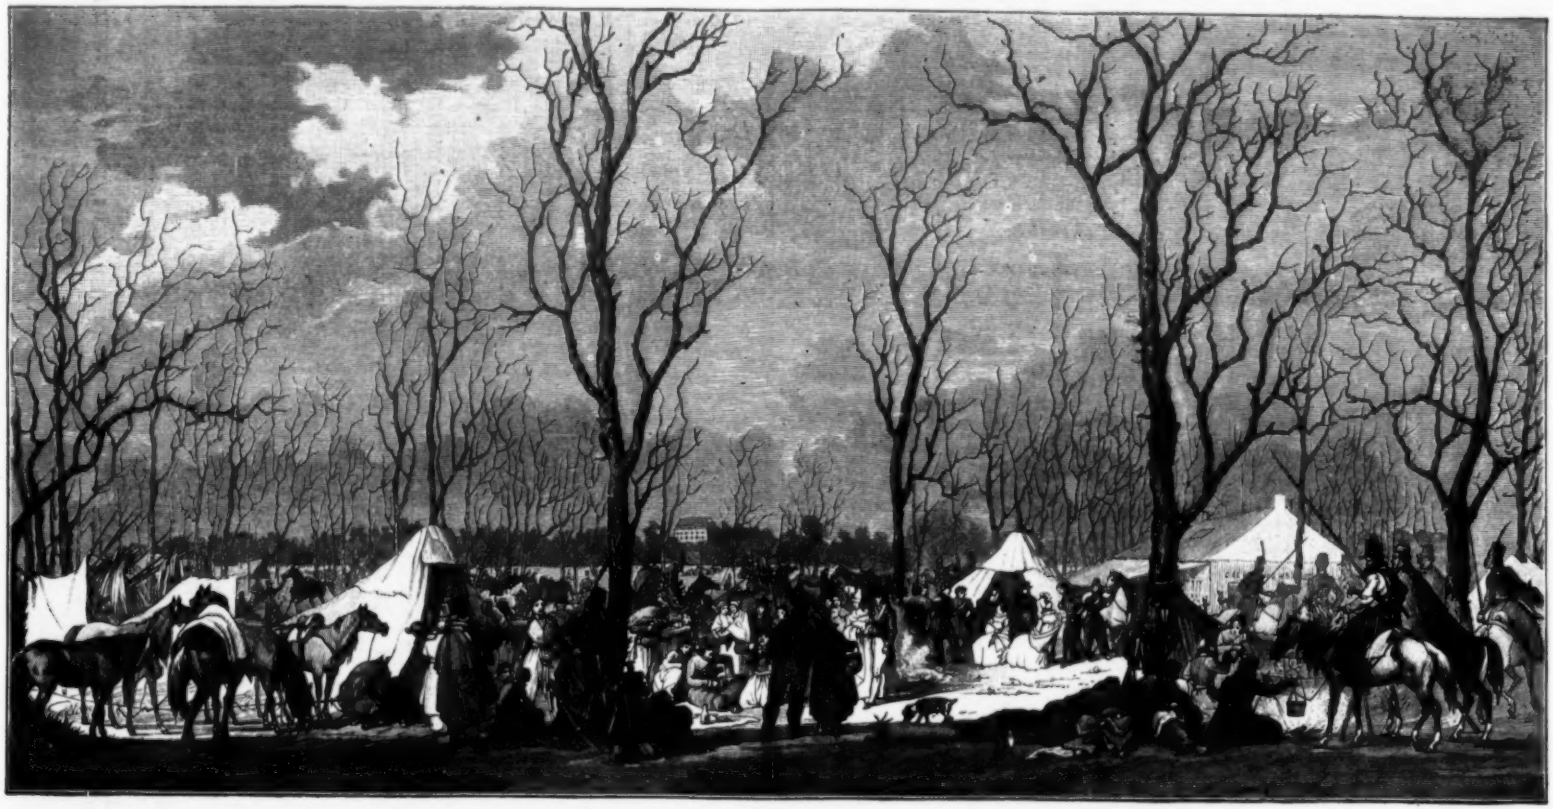
If we go back to the epoch during which the most prodigious efforts were made to strangle the Reformation—the period distinguished by the Blood Tribunal in the Netherlands, the massacre of St. Bartholomew, the War of Independence in the Netherlands, the Spanish Armada, and the struggle between Henry of Navarre and the League in France—we shall find during this period there were seven exceptionally severe winters. In 1564–65 the Thames was frozen over, and the Rhone also at Arles. In 1570–71 the French rivers were again frozen; in 1586 the cold was so extreme as to kill the olives in Provence; in 1594–95 the winter was such that nearly all the fruit-trees in France perished. To these winters, thus distinguished for severity, we must add 1582, 1584, 1591, since they are mentioned by M. Renou, secretary of the Meteorological Society of France, in his lists of extremely rigorous winters in Europe.

Modern revolutions in Europe have generally been preceded by hard winters more or less numerous. Thus the Reformation was preceded by a group occurring in 1490, 1494, 1499, 1500, 1503, 1506, 1507, 1508, 1511, 1515. These rigorous times were coincident with the insurrections of the German peasants, which happened successively in 1491, 1502, 1510, 1522, 1523, and 1525, during which it is estimated 150,000 persons lost their lives. The winters of 1503 and 1507 affected Italy, the Po being so completely frozen in 1503 that an entire army crossed it, and in 1507 the lagoons at Venice were frozen. The winters in 1506 and 1515 were those that more especially affected England, the Thames being frozen on both occasions.

### 1649–1689.

John Evelyn, in his diary under date January 22, 1649, says: "Now was the Thames frozen over and horrid tempests of wind;" and a little further on the following comes: "The villany of the rebels proceeding now so far as to try, condemn, and murder our excellent king on the 30th of the month, struck me with such horror that I kept the day of his martyrdom as a fast."

The ruin of the Puritan Revolution, and the Restoration with its truculence, vice, corruption, and treason, like the corresponding epoch a century and a half later in France, seemed to chill the heart of Nature, for during the reigns of Charles II and James II we read of quite a series of severe winters, some of which left such an impression as to become historical. The series in France extending from 1656 to 1709, according to M. Renou's definition of a rigorous winter, number at least a dozen, showing that the reign of Louis XIV, if one take into account the griping taxes he laid on the people and the frightful way he persecuted the Huguenots, and the agonising insurrections his cruelties provoked, must be regarded as one of the greatest calamities that ever befell a people.



In England the series commenced with the winter of 1664–65. February 6, Pepys notes as "one of the coldest days ever felt in England;" the frost had continued from December 26 to February 7. The previous spring had seen the Conventicle Act passed, a type of the nature of the power predominant. The Great Plague of London followed this winter, commencing in May 1665, and raging throughout the year. It ceased in February 1666, and in September of the same year came the Great Fire of London. Milton's "Paradise Lost" was published in 1670, so that in all probability he was writing the opening lines in full memory of this period, which commenced in deathlike gloom and ends in the charred ruins of "huge Augusta"; and he was thinking of England when he wrote:—

> "Seest thou yon dreary plain, forlorn and wild,
> The seat of desolation, void of light,
> Save what the glimmering of these livid flames
> Casts, pale and dreadful?"

1660–65 was a period of great dearth in France, 1670 by the destruction of trees in that country

*From an old Print.*] FAIR HELD ON THE THAMES BETWEEN JANUARY 31 AND FEBRUARY 5, 1814.

*From an old Print*] BIVOUAC OF THE COSSACKS IN THE CHAMPS DE MARS, MARCH 31, 1814.

by frost, and 1672 by a similar destruction in England.

But the great winter of this period was 1683–84, so terrible in France that about Tours a third of the people perished. What it was in England may be gathered from Pepys, who, after mentioning that "the air" on January 1, 1684, "was very cold and thick, as of many years there had not been the like, and that the smallpox was very mortal," speaks on the 9th of "streets of booths across the Thames as in a town," and that coaches, carts, and horses passed over. On the 24th he states, "the frost became more and more severe. . . . Coaches plied from Westminster to the Temple, and from several other stairs to and fro, as in the streets; sleds, sliding with skates, a bull-baiting, horse and coach races, puppet plays and interludes, cooks, tippling and other lewd places, so that it seems a bacchanalian triumph or carnival on the water, whilst it was a severe judgment on the land, the trees not only splitting as if lightning struck, but men and children perishing in divers places, and the very seas so locked up with ice that no vessels could stir out or come in, the fowls, fish, and birds, and all our exotic plants and greens, universally perishing. Many parks of deer were destroyed, and all sorts of fuel so dear, that there were great contributions to preserve the poor alive. Nor was this severe weather much less intense in most parts of Europe, even as far as Spain and most southern tracts."

This great fair on the Thames created an extraordinary impression. Several broadsides with engravings exist; one, called "Erra Pater's Prophecy, or Frost Fair," in 1683, tells how that seer or "his rambling ghost,"

> "Prognosticated of this long, strong frost
> Some ages since."

Another calls it "Blanket Fair"; a second, "Great Britain's Wonder"; a third, "A Winter Wonder"; and a fourth, "The Wonders of the Deep." Many are the touches these ballads give us of the life of the day. The things that strike most of them as the great events, are the roasting of an ox and a fox-hunt on the frozen river. Besides these enjoyments, the sightseers were amused by the baiting of both a bull and a bear. Coffee-houses in great number were scattered about, where by a charcoal fire any one could buy "a dish of coffee, chocolate, or tea." Indeed, eating and drinking and gambling were carried on to such an extent that one broadside says:—

> "Here is also a lottery, and music too,
> Yea a cheating, drunken, lewd, and debauch'd crew,
> Hod codlins, pancakes, duck, goose, and sack,
> Rabbit, capon, hen, turkey, and a wooden jack,
> In this same street before the Temple made."

With smallpox very mortal, men and children perishing in divers places, with the blood of patriots like Lord William Russell and Algernon Sidney just shed on London scaffolds, with Nature throughout the land groaning like a dying man in anguish, this picture of the Thames in 1684 is completed when in the foreground we see the genius of the time, Charles II, surrounded by all the members of his royal house, going in for "the most peculiar humours of the time," and cutting his coarse jokes *au goût français*.

The next great frost in England occurred in 1688-89, lasting from December 20 to February 6. The Thames was again covered with streets of shops, bull-baiting, etc., hackney coaches plying along the ice-roads. Yet in two days all the ice had disappeared and the river was flowing once more. This, too, was not unsymbolic, considering that just at that very moment "the long winter of our discontent," the gloomy period during which English liberty and English morality sank many degrees below zero, came suddenly to an end.

Historians seldom note the moods of nature, but man is only part of a great whole, and there are close relations between things mental and moral and things natural. But, not to be too philosophic, how helpful the weather is in fixing a picture of the historical drama on the mind. How chilly London must have looked when, after his abortive attempt to quit the country, James II came back to the deserted palace in Whitehall; how dismal to be told at such a time that he must quit the comfortable apartments to which he was used and go to a cheerless, unfurnished house like Ham; what a melancholy voyage was that to Rochester on December 18, 1688, in a bleak and icy wind and the river rapidly freezing. We see during this frost London passing through alternations of gloom and joy, its citizens sometimes looking menacing as the weather, and again running with faggots into the streets and lighting up great bonfires. And how typical must the thaw, with its promise of a new and happier summer, have appeared to the crowds who awaited the procession which on February 13 went to offer the crown to William and Mary.

### 1691–1789.

Never could the expression "the winter of my fortunes" have been more truly used than by Louis XIV. During the closing years of his reign every wintry terror gathered over Europe, of which he had made Versailles the centre and himself the leading monarch. According to the meteorologist Renou, great cycles of rigorous winters travel across Europe, taking a north-westerly direction. Thus that of 1709, which synchronises with the humiliation of Louis XIV, was preceded by the severe winters of 1691, 1695, and 1696, in the first of which we hear of wolves entering Vienna, and attacking not only cattle but men.

But that of 1708–9 is *the* winter of this period. It opened in the usual way of such times, by flights of wild swans and other northern birds. It was European, but its centre and severest ravages seem to have been in France. Thus, while so rigorous in the southern parts of Great Britain as to freeze the Thames, it was in Scotland and Ireland only an ordinary winter. On the other hand, it was very severe in Italy, Germany, Switzerland, and Denmark. In Copenhagen Harbour the ice was twenty-seven inches thick, at Dantzic small birds dropped down dead, and freshwater fish perished. In Italy there had been no such cold for twenty years, all the orange and olive trees were destroyed, as was also

the case in Provence; a kind of gangrene appeared on them. Through the rest of France a great part of the trees were destroyed, all the rivers were frozen, the frost being so severe that in Paris wine froze in the barrels and the bells cracked in ringing. Near Paris sixty men and several cattle were frozen to death; eighty French soldiers perished from cold at Namur. Coming on a people already stripped naked by the extortions of their rulers, a people who in the rich district of Rouen slept on straw, and who could not, like their English contemporaries, afford to wear cloth, whose dwellings were all in ruins, whose stalls were empty and the sheep gone, the mortality was frightful. Epidemics came, and the hospitals were so besieged that the poor were turned away by crowds. A troop of miserable skeletons gathered round the golden gates at Versailles; the German guards, not understanding their cries, drove them away. But the famine became so severe that the valets of the king, and among them gentlemen, begged their bread in the streets of Versailles. Riots occurred everywhere, and were quickly suppressed with unheard-of rigour. The roads were strewn with corpses.

The year in which Louis XIV died was signalised by a severe winter, which was the more remarkable in England, as during its continuance the Old Pretender raised a rebellion. The frost began about a fortnight after the defeat of the Jacobites at Preston Pans, and concluded on the very day the Earl of Derwentwater and five other peers, taken prisoners, were sentenced to death—that is to say, it continued nearly two months and a half. A fair was held on the Thames somewhat like that in 1684. In the winters of 1725, 1726, 1728, and 1729 the weather was somewhat severe, and 1739–40 was remarkable enough to leave a lasting memory, its extreme severity being handed down as a tradition. An Ice Fair was held on the Thames, and the erection of printing-presses on such occasions having become a permanent institution, the memorials of this particular fair are numerous. The cold in 1739–40 was peculiarly severe in Russia. An ice-palace was erected on the Neva with cannon and mortars in ice. From one of the latter a ball was actually fired without the mortar being destroyed.

1762–63 was the next severe winter in England, the frost lasting ninety-four days. 1766 was also serious, very great damage being done to the trees by the combined action of frost and snow. Gilbert White speaks of the thermometer indoors at Selborne in 1767-68 falling to fourteen and a half degrees below freezing-point.

In 1783–84 the frost in England lasted eighty-nine days, in Paris sixty-nine days, the Seine being frozen for two months. The "Gentleman's Magazine" says, in February 1784: "From different parts of the country we have accounts of more persons having been found dead on the roads and dug out of the snow than ever was known in any one year in the memory of man."

The year 1788 had been remarkable in France for a hailstorm which devastated 150 miles of the country, destroying the crops. The dearth was consequently extreme, and northerly winds set in, making it worse. The helpless poor were found dead in the barns or on the roadway, and in Paris the number of persons found dead in the streets led to the opening of a special hospital.

On November 26 the Seine was frozen, and the Loire, the Garonne, and the Rhone were in the same condition. The ports were blocked, the communication between Dover and Calais stopped. The harbour at Marseilles was a sheet of ice, the olives perished in Provence. In Paris the thermometer (Réaumur) was 18½° below zero, and all the fountains in the city were frozen. The water mills throughout the country stopped, so that no corn could be ground, and, besides, all supplies ceased, the corn barges being locked in the ice.

The break-up of the frost only proved another form of disaster. The rivers became suddenly swollen, broke their dykes and flooded the country. Towards the middle of January great blocks of ice came sweeping down the Loire, carrying away bridges at Orleans, Tours, and Cé. The inundation of Orleans occurred at night; six parishes were under water, and more than twelve miles of country. The people were suddenly awakened in the dark by the rushing waters. In the valley of the Loire it was difficult to assist the victims, the landing-places having been all carried away.

There had been all sorts of amusement on the ice at Lyons; suddenly the Rhone and the Saone began to break up, and then the current, loaded with icebergs, was so furious that a bridge on the Saone, 300 feet long, and having seven arches, was swept clean away. The havoc caused by the two rivers was such, that two-thirds of the boats, washing-barges, mills, and factories of all sorts on their banks were destroyed.

France in 1788 seems again only the centre of a winter unusually severe throughout Europe. Loaded waggons crossed the Rhine and the Elbe, and the sea on the coasts of the Netherlands was iced to a distance of ten miles. The Thames was frozen down to Gravesend, and the fair usual on such occasions held on the ice. On December 31, 1788, the cold at Strasburg was intense; it had been still more so at Berlin on the 20th; while at St. Petersburg, on the 12th, it was three degrees lower than at Berlin; in Poland and Northern Germany the cold was even still greater; while at Bâle the thermometer sank 13° below that recorded at St. Petersburg.

### 1844–1871.

To the extraordinary winters that ushered in the great revolutions of 1688, 1789, and 1830 we may add those of 1848 and 1871. We may mention by the way some intervening. 1838–39, a very troubled period in this country, was remarkable for the severity of its winter, the frost lasting eight weeks. During this period the Royal Exchange was burnt down, and, as proof of the intense cold, it is stated that the water pumped on the fire hung in icicles, producing a strange and startling effect.

The winter of 1840 was distinguished by the arrival of the remains of Napoleon I from St. Helena. The day they entered Paris was so excessively cold, that some people who had climbed the trees, with a view to see the procession, fell benumbed with cold and were killed.

1848, the year of revolution and reaction, was

preceded by a winter of so unusual a character that Mr. Glaisher is reported by the Registrar-General in January 1848 to have stated that he had searched all the meteorological records at his command for the previous fifty years, and had failed to find any season of a similar character. With the exception of three or four days in November, when it was remarkably cold, the temperature of the last three months of 1847 was steadily above the average, frequently during November and December rising somewhat in the night and falling again in the day. On December 20 this changed, and the electrical condition of the atmosphere, up to that time neutral, every day showed signs of activity. On December 7, notwithstanding the long-continued equable state of the atmosphere, the barometer fell so low as to be only paralleled by four previous readings in the century. Early in February 1848 the barometer began to fall, and continued to do so at intervals from the 3rd to the 10th, until the difference between the two days amounted to 1·21 inch. This was the more extraordinary as the thermometer was unusually high for the season, varying between 44° and 50°.

On January 5 and 6 there were heavy snowstorms in Scotland, the cold during the night increasing to a degree unprecedented in sudden frosts. The snowdrifts were so deep that the Inverness mail had frequently to cut a passage through them, and was consequently thirteen hours in getting from Dalwhinnie to Perth.

During the last three months of 1847 the aurora borealis was visible eight times in England, and now, at the opening of 1848, there was seen in Scotland a most beautiful display of a rose-coloured aurora, the whole heavens being illuminated for an hour before midnight with a light equal to that of the full moon. The close of the month was again distinguished by a heavy fall of snow all over England and Scotland, the frost being so severe in France as to freeze the Seine and some of the waters in the north of that country.

1844–45 was a long cold winter, but for an historical winter we must go on to that known as the Crimean winter—1854–55. Its interest, of course, centres in the scene of the great struggle. It opened with a violent hurricane, accompanied by thunder and lightning and heavy rain and sleet, ending in driving snow. This cyclone swept the Chersonese and all the neighbouring coasts, harbours and roadsteads.

It tore up the trees, took the roofs off the houses, and swept many of the tents in the camp of the Allies clean away. The horses broke loose and fled in all directions, the waggons were overturned and their stores of food and forage spoilt. The most frightful damage was done to the fleet: twenty-one vessels loaded with munition and stores were totally wrecked, eight others dismantled. Balaclava Harbour was a crashing thicket of bulwarks, masts, and spars. The hospital marquees were the first tents to fall, so that the wounded, the sick, and the dying were exposed to the cold blasts and deluged with rain and sleet. The trenches were flooded, no camp fires could be lit, nothing could be done, for no one could move, horses and riders being overthrown again and again. The misery was unutterable.

The winter which followed was emphatically "hard"—cutting blasts, persistent falls of snow, storms of sleet, torrents of rain. Thousands were frostbitten, many died; of those that survived the main number were grievously mutilated; few escaped without being maimed for life. During the winter, out of an average strength of 28,939 men, 10,053 died from sickness alone, most of the maladies being zymotic. The French suffered in like manner, 50,000 being admitted to their hospitals, while during the war 95,685 of their soldiers perished!

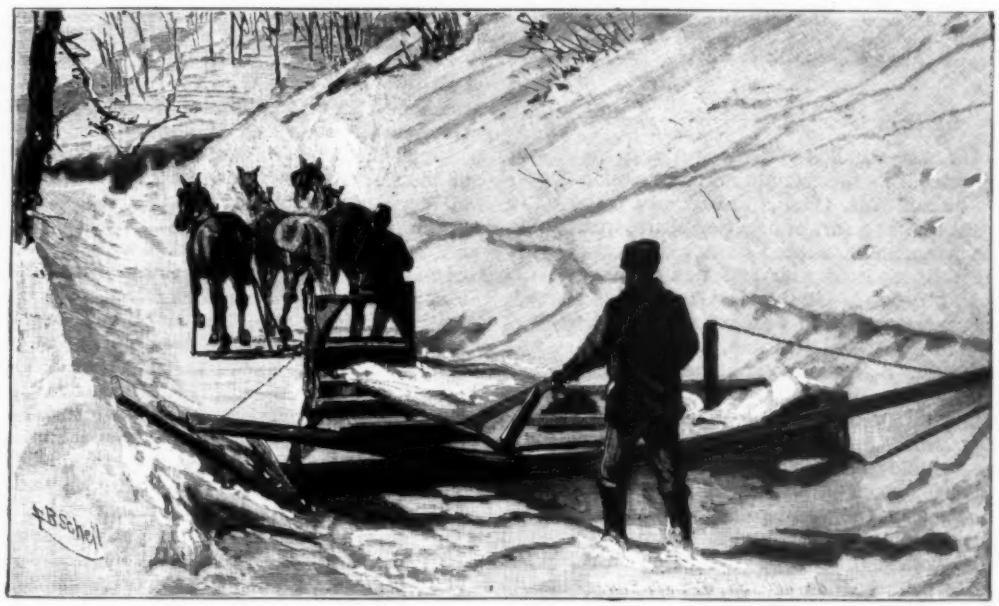
The invasion of France in 1870–71, the fall of the Second Empire, and the siege of Paris, like the Crimean War, was a crisis in which human suffering was aggravated by the extreme severity of the weather.

During the defence of Paris it was so terrifically cold that the infantry at Romainville are described as shivering like dogs in wet sacks, their teeth chattering, their faces leaden, their hands red as raw beef, their breath stiffening their beards and making them sticky with icicles. Wounded men exposed for a few hours were frostbitten. A sentry was found standing stiff and stark, frozen to death in his box; sixty deaths resulted in a few days from the same cause. The temperature grew worse and worse as 1870 closed, until Christmas Day was hyperborean. People said it was the severest winter known for forty years. Across the whitened plains the beleaguered Parisians saw an aurora borealis.

### TENTH TO FOURTEENTH CENTURY.

Having glanced at nearly every period since that which preceded the Reformation, it may be worth while to note in a still more cursory manner a few striking facts with regard to the winters of the middle ages.

In the last quarter of the tenth century Europe sank into despair. Harried by the Northmen, the Slavs and Magyars, cruelly oppressed by the nobles who had possession of the soil, presided over by a series of degraded pontiffs, the people believed the earth was in its last agonies. In this terrible period there were forty-eight famines in sixty-two years. From 990–994 was a succession of famines, and of what seems to have been a carbuncular disease. In 1001 there was a great famine; from 1003–1008 another series; 1010, 1014, 1021, 1029 were a succession of famines, growing at last so bad, that stories of cannibalism were rife. 1031–1033, another frightful series, followed again in 1035 by famine and epidemics, and again in 1045–46, until in 1057 one commenced which lasted seven years, ravaging the whole of Europe, beginning in the east, and extending through Greece, Italy, France, England. No doubt this perennial state of famine was due mainly to the intestine warfare carried on by the lords of the time, by which the labourers were carried off from one part of a country to another, and by which vast tracts were so devastated that they remained for years without cultivation. A horribly wasteful system, a pure reign of terror, these wicked strong men made Nature herself agonise and groan. Such were the records of the harvest times; almost equally



distressing are those of the winters. 974–75, called the "Great Winter," was such a terrible time, that one-third of the population in France was destroyed. It was also severe in England and in the east of Europe, the Bosphorus being frozen over so that passengers crossed on the ice. 987–88 was a winter almost as memorable in England as the "Great Winter" was in Europe. The frost lasted 120 days, and elsewhere all the seeds were destroyed. In 998 the Thames was frozen, in 1009 the rivers in Italy were frozen. 1020 was again a severe winter in England. In 1035 there was frost in England on Midsummer Day. Truly Nature was ill at ease.

And this goes on through the eleventh, twelfth, thirteenth, and fourteenth centuries, during which there were far beyond the average number of severe winters, between forty and fifty being mentioned as remarkable. The Thames was frozen over several times, and sometimes all the rivers of England are mentioned, and the same is stated of the rivers in France and the lagoons at Venice, all signs of a more than usually rigorous winter. The same kind of facts occur again and again—pestilence, famine, cannibalism; and in France, where in these bad old times things seemed always to go to extremes, we find in the fifteenth century the rich northern provinces reduced to a desert, and the wastes so perpetually increasing, that one province, La Beauce, was covered with brambles. In consequence of this state of things the peasants fled into the towns, only to find there new forms of misery. In Paris the poverty was so dire that the king fled, and the English conquerors never cared to come again. Wolves, so the story ran, had devoured fourteen men between Montmartre and the Porte St. Antoine.

The people who had to suffer these things were not physically stronger than their descendants to-day; indeed, to judge from the dimensions of old armour, they were probably less so. Moreover, the ordinary cold weather must have been worse than it is to-day, considering the unreclaimed state of the land, the greater part forests, marshes, and wild heaths. Thus it was that pestilence and famine swept them off by hundreds of thousands. The Black Death (1349) destroyed, it is said, half the population in England; and yet it came again in 1361, and again in 1369.

But, then, to balance these miseries they had processions religious and civil, everybody of consequence being dressed up; public life was, in fact, a series of theatrical shows. In winter and its mummers we have a picture of Mediæval Europe.

R. HEATH.

CANADIAN SNOW PLOUGH

# THE INCOMPLETE ADVENTURER.

BY TIGHE HOPKINS, AUTHOR OF "THE NUGENTS OF CARRICONNA," ETC

HE DID NOT FEEL SO SURE OF HIS FINANCIAL GENIUS ON THE OMNIBUS AS HE HAD DONE IN THE CARRIAGE.

## CHAPTER IX.—BREAKFAST AND NOTHING ELSE.

GUY was installed with honour and tributes of esteem in the sumptuous Elizabethan manor-house. Mr. Gault, who seemed disposed to regard him as a sort of new Cagliostro, treated him with a ceremonious and almost deferential grace which harmonised with and was pleasing to the exotic humour of Guy. Mr. Gault and his daughter were prepared to be charmed with Guy, and they were charmed with him.

The true Bohemian is at home everywhere. He is the cosmopolitan, who is at his ease at all times and in all places, because the comedy of life at large is his element, and his part in it is as easy and as agreeable to him in one scene as in another. In a drawing-room in the evening he reclines with grace against the mantelpiece; and at breakfast in his garret in the morning he smooths his landlord down with a promise of payment when the affairs of the country shall be happier. It is all one to him what government he lives under, and he never has the slightest idea whether the Tories or the Liberals are in office. Under the one *régime* or the other, the problem of the rent is the same.

Guy, being such an one as this, found everything to his taste in the manor-house. Dinner was ordered in the stateliest manner, and the host recommended with polite and punctilious praise dishes which he pointedly eschewed. Trona took them as they came with a healthy appetite; and Guy was on the side of the mistress.

A slight shadow passed over the steady features of the butler when his master, rejecting the dish of corn stewed in milk which had been his favourite regimen for a full nine days, asked instead for a plate of thin bread-and-butter. But when Mr. Gault produced the powder, the butler looked quite at his ease. He was the only person in the house, except Mr. Gault, who had a profound belief in Mr. Gault's maladies, and he was always sure that the new remedy was the one which they had both been seeking. Mr. Gault dined on bread-and-butter and powder, and rose from the table with the air of a man whom fate could not harm.

"This will do," said Guy to himself; "this is worth a fair five hundred pounds."

He was on the point of acquainting Mr. Gault with the nature and conditions of his bargain with M. Rohand, when Mr. Gault, who had already risen from his chair, suddenly remembered that he had neglected his regular practice of sleeping for fifteen minutes at the table, in an upright posture, with his chin resting lightly in the palm of his left hand.

While Mr. Gault slumbered, Guy went on with the story which he had begun to tell Trona under the honeysuckle earlier in the day. The piano stood open for a little music, but not a note was struck. Guy himself was a musician of some

genius, but the only instrument on which he played that evening was the imagination of his pretty hostess. Upon that instrument, however, he played to brilliant purpose. Trona gave back to him all his own raptures, and began straightway to stimulate him to yet larger notions of the wealth his secret might command.

She prattled on deliciously, throwing in every now and then a scrap of financial *argot* which (as he did not understand it at all) made Guy think that they were now arrived upon solid ground.

It is perhaps unnecessary to emphasise the fact that Guy himself—for all his lavish rhetoric—knew no more of syndicates than of sheep-folds. Trona could talk syndicates by the hour together; and while she looked so pretty and so charming that one could have wished she did not understand a syllable of what she said, she really appeared to have the whole naughty business of company-floating at her delicate fingers' ends.

Guy had to swagger most imperially to preserve the merest show of keeping pace with her.

Her seeming familiarity with the way they "did things" in "the City," her mingled shrewdness and impulsiveness, her limitless belief in the future of the undertaking (and perhaps even, in some infinitesimal degree, her fine and piquant beauty) wrought upon Guy in a manner that was at once stimulating and weakening.

The end of it was (and it is surprising how quickly an end of this sort may be reached) that Trona and the scheme, and the scheme and Trona, came to blend themselves as a single and indivisible interest in Guy's imagination.

"How ridiculous to think that one only wants £500 to set it going!" said Trona.

"Is it not quite absurd?" cried Guy. "Don't you think it altogether too small a sum?"

"Of course, it is very small," said Trona; "but, after all, it may make the start a little easier. You see, the company, or syndicate, or whatever it is going to be, will write you a cheque for that amount straight off, the moment the preliminaries are settled."

"Eh?" exclaimed Guy, to whom this notion had never before presented itself. "They would do that? You are sure they would do that?"

"It is quite ordinary," said Miss Gault.

"In that case," continued Guy—but just then the door of the drawing-room opened, and Mr. Gault entered, sweet and gracious, without a trace of slumber on his fresh and comely features.

"It is long since I felt so free from material discomfort," observed Mr. Gault, with a smile. "I am really almost well this evening," and the air with which, as he said this, he dropped tenderly on an ottoman in the centre of the room, conveyed the impression that the improvement in Mr. Gault's condition had made the world his debtor.

"Oh, papa," said Trona, "and do you think it is all owing to Mr. Warwick?"

"I cannot help being almost sure of it," answered Mr. Gault.

"Then, papa, a company must be floated at once," insisted Trona.

"Must it really come to that?" queried Mr. Gault, a little less warmly. "Must we indeed give it to the world?"

"Why, it is just for that that Mr. Warwick has come from Paris, papa. From *Paris*!" urged Trona, with an emphasis which removed the French capital to some region unknown to the geography of Mr. Stanley himself.

"And what is more," added Guy, "I feel that not a single day ought to be lost."

"Then I will tell you what I shall do," said Mr. Gault, with a certain unwilling deliberateness, "I shall ask Mr. Warwick to accompany me to town to-morrow" (Mr. Gault shivered a little as he said this, for he was always unwell in London), "when I shall introduce him to the only person who is fit to be entrusted with an undertaking of this magnitude."

Guy, that night, pillowed on down in the guest's chamber, visioned the accomplishment of everything. Some of us are prophets in our dreams. But Guy's was a waking dream, which neither chance nor destiny ever takes the smallest account of.

His early habits stood him in good stead on the following morning.

Mr. Gault, whose daily existence was a work of genius, a dietetic problem to the solution of which his best ingenuity was devoted, breakfasted invariably at 8 A.M.

M. Rohand's anodyne was evidently doing justice to itself and its inventor, for Mr. Gault descended to the dining-room fresh and winsome, murmuring in his delicate and soothing tones a couplet of Dryden:

> "Better to hunt in fields for health unbought,
> Than fee the doctor for a nauseous draught."

"For, you know," said he to Guy, on entering the room, "it is directly back to the fields that this ineffable anodyne takes us. Health, health! O health!"

"And competence," interposed Guy, drawing down the cuffs of his jacket that his wrist-linen might not contrast too markedly with the snowy damask of the table-cloth. "Health by all means, but I am for competence along with it."

"A heap of dust, a mere dust-heap!" sighed Mr. Gault, surveying himself reproachfully in the silver dish-cover before him.

"I venture to suggest that Miss Gault is not entirely in accord with that sentiment," remarked Guy.

"Miss Gault is entirely *out of* accord with it," smiled the young lady herself. "Miss Gault is for shares, and dividends, and 'booms,' and 'corners.' Miss Gault is for rigging the market."

"My playful darling!" murmured the father.

"Ah! wait till Mr. Warwick and I have floated the company, papa. I hope you have not forgotten that you are to present him in the City to-day."

"I have remembered it from an early hour this morning, dear," replied her papa, who, to say the truth, was always sick with apprehension before the prospect of a visit to town, which was to him the kennel of all the diseases that science and civilisation had united to produce.

"I hope you won't mind driving, Mr. Warwick," said Trona. "Papa is incorrigible about trains. He would rather walk the whole way than venture himself in a railway-carriage."

"A thousand times," said Mr. Gault. "I know of no more injurious or displeasing mode of travel. The vibration, the jerks, the irregular and sudden stoppages, the continuous whistling at something, the slamming of doors, which ought to close automatically and without a sound, the inconsiderateness of passengers who get into the wrong train and insist on your taking their part against the officials, the moral certainty that the cushions of the carriage are charged with disease-germs, the high probability that something is wrong with the shunting appliances or the signals, the——"

"There, papa, there!" interrupted Trona, soothingly (though Mr. Gault's diatribe was delivered in the kindest and most mellifluous accents), "your porridge is getting cold, and you have not half finished it."

"Accept my apologies!" said Mr. Gault to Guy. "I am accustomed to talk in this way to my child, who is sadly too much infected with the modern spirit; though I encourage her a little, in opposition to my principles, for the reason that everything she says puts me more strongly on my guard against the habits and tendencies of the age. My dearest child, your artless enthusiasms have often inspired me with renewed distrust of the whole fabric and foundation of society."

"Then I have, at all events, done something, papa," said Trona, reproducing the long-drawn smile and leisurely accent of her father. "Please remember, Mr. Warwick, that whether we win or lose with the company, I shall not have lived in vain."

"*Pardon!*" exclaimed Grey, who had been breakfasting ferociously during the anti-social excursions of his host; "that is, for a woman, the very negation of self-praise. A woman can no more live in vain than the sun can shine without vivifying the world. If that is all that can be testified of you at the last, your tombstone had better go bare of epitaph. *Ça ne vaut rien du tout!*"

"But I am going to make a fortune besides," said Trona.

"In that case, you will certainly deserve an epitaph," responded Guy. "If you make a fortune, whether in books or butter, you prove yourself a genius, and genius (whether of the book-writer or the butterman) merits an epitaph, because it is the sole possible link between one's own generation and posterity. We recognise our kinship with the past only by the highest achievement of the best man or woman of the generation that preceded us."

Mr. Gault, having finished his porridge, scattered a spoonful of the powder over a slice of fine brown bread, and ended his breakfast with that.

"The man of this generation who will be most regarded by the next," said he, "will be the slayer of the foreign cook."

"Then it will be M. Rohand," observed Guy.

"And Mr. Warwick with him," said Trona.

It was arranged that they should start for town at eleven o'clock.

## CHAPTER X.—A RESULTLESS PROPOSAL.

"WILL you walk into my garden?" said Miss Trona to her guest.

"Let us go and evolve a prospectus," answered Guy.

"It is just what I want to do," said Trona. "I have been drafting one in my head all night."

"The garden is the very place to do it in. We want the inspiration of nature for this prospectus. There must be something sweet and truthful in it. I think it should contain a 'message.'"

"Y-yes," said Trona, drawing on her garden gloves. "Y-yes; a little message might be worked into it, perhaps. But after all, you know, a prospectus is a prospectus; and the object of a prospectus is to hit the speculator—to hit him square."

"He is so simple a creature," said Guy, "that I have very little regard for him. He is caught too easily. But let us go and circumvent him in the garden."

There was a spot in the sunny south of the grounds which Trona held for her own; where she defied the hired gardeners, and absolutely forbade ribbon-gardening and geometrical borders; revelling in irregular masses of mignonette, and sweet-peas, carnations and sweet-williams; with hedges of sweet-briar, and archways draped in honeysuckle and convolvulus: the conventional man-trap.

"Now I'll tell you how I think it should begin," said Miss Gault; and whipping a gold pencil-case from her chatelaine, she dashed into the prospectus, quite like any practised deceiver owing a quarter's rent in Great Broad Street. When she had written a dozen sentences, she handed the manuscript to Guy.

There was a considerable lack of "message" in it, but for that reason it read very like a prospectus; and being the exact opposite of what Guy had vaguely imaged for himself, he concluded that it was just the document he wanted.

"It is finance transformed into a fine art! Your pen will be absolutely invaluable to us. I beg that you will at once accept the Secretaryship of the Company."

"But the Company isn't formed!" said Trona.

"With that for a prospectus," answered Guy, "I consider that it is not only formed but floated."

"We can think that, of course," returned Trona, "but we ought to look at the matter from every point of view, you know. Suppose that, after all, it shouldn't succeed. What I think about it is, that it must be either the biggest triumph or the biggest failure on record. Just think, if it should be the biggest failure!"

"That," responded Guy, "would be exceedingly and entirely deplorable. It would be the most deplorable thing that I am able to imagine."

"Oh! no, no; don't say that," urged Trona. "Are there not—"

"Pardon me," interrupted Guy; "if what you suggest were to happen, it would be impossible for me ever again to speak to you of love."

"Of what!" cried Trona, shutting up her gold pencil-case with a snap which emphasised the abrupt transition from finance to courtship.

"Of love," repeated Guy.

"But you have never before spoken to me of such a thing!" said she.

"Excuse me," answered Guy; "I have never spoken to you of anything else."

"I don't in the least understand," said Trona, in a great hurry.

"We have dispensed with the customary preliminaries, that is all," answered Guy.

"But—but it is utterly out of the question to dispense with them," said Miss Gault, breathlessly.

"Then we will go through with them," replied Guy.

She wore a great white sun-bonnet such as children wear, and, with the instinctive and ineradicable duplicity of her sex, she looked as though she were very much astonished.

No, she would not have anything to say to the preliminaries now.

"Please get out my tricycle," she said.

It is seldom prudent to begin by leaving out the preliminaries. If the effects of love are the same, or pretty nearly the same, in all ages, countries, and conditions, the modes of address (by which is meant, the manner in which courtship may be pursued) are infinitely various. But a certain style or method—influenced and regulated by custom, and seldom the same in two countries—underlies them all. Moreover, every girl has her own idea as to the way in which she would choose to be wooed: mostly a quite impracticable one.

There are, however, two plans which prudent lovers will eschew: the first is, to propose through the post; the second is, to spring your proposal without a moment's warning, and as from an ambush.

But Guy was firmly persuaded that he had been making love to Trona for four-and-twenty hours without intermission.

"Please get out my tricycle," she said.

The confident serenity of Guy was in no way disturbed, and he went with the lady to get out her tricycle. The resultless proposal is usually an embarrassing affair, but not so to persons with the temperament of Guy. He was still in the empyrean. He passed easily into those states of exaltation which form no part of the existences, objective or subjective, of regular and well-ordered persons. But the man is imperfect and unhappy in the intellectual and spiritual relations of life who has not a little of the lunatic in him, who cannot at times feel and perceive things that are not here, see himself and other men as trees walking, and the world as a much bigger and more glorious place than it is, and himself as the roof and crown of it. Who is not capable of hallucination knows not the world that may be, nor the possibilities of the world that is. Who has this capacity is as free of the one world as of the other, and dwells in both at once.

Guy fetched out the tricycle, and assisted her into the saddle. To mount a lady comfortably on her horse asks a certain lightness and grace of hand which are readily acquired in the hunting-field. To enable her to adjust herself easily on the poor little saddle of a tricycle built for a gossamer weight requires a nicer and more gallant touch. The tricycle is accountable for many new developments of the tender passion; and statisticians who have confessed themselves puzzled by the recent increase in the marriage rate are evidently not aware how many ladies are purchasing light roadsters on the hire system.

But all this while Miss Gault was not saying anything. The abruptness of Guy's observation, if it had not exactly taken her breath away, had startled her into a half-abashed, half-petulant silence. Guy was for striding along beside her, but at the moment she had no mind to that. The stable-clock boomed out ten and a quarter.

"A quarter past ten," said Trona. "I was quite forgetting your engagement with papa. If I'm not back before you start, give him my love and tell him to bring me the 'Economist.' I shall have tea for you at five. Good-bye!"

And she shot away from Guy at eleven miles an hour.

"It is the seven-leagued boot of mechanical science," observed Guy, as he watched the vanishing wheels. "To think that the spiteful fairy should enter into the shape of a tricycle! But she is in her dotage, or she would not have chosen me for her victim."

## CHAPTER XI.—FINANCE IN A FOG.

LET Guy be where he might, he was greatly influenced by his surroundings. Reposing on the seductive cushions of the softly-rolling carriage which was bearing him at a fair nine miles an hour to London, his regard for himself increased moment by moment. He had almost forgotten the presence of Mr. Gault, who, as his wont was, began to be ill at ease and melancholy as they drew near to town. It seemed to Guy that the situation was his own.

The elegant carriage might have been built expressly to his order, for he observed that his legs stretched exactly to the opposite seat, whereas Mr. Gault's came at least four inches short of it.

The scheme, that unrivalled scheme, took larger and larger shape in his imagination. What a great thing to have this genius for finance! How had he remained so long in ignorance of his genius? "Ah! it was the opportunity that was wanting," he murmured; forgetting that it is talent, not genius, which waits on opportunity.

And here he was now, whirling to fame and fortune, nine miles an hour. The pace was unworthy of the mission; he addressed himself to the coachman, requesting him to drive a little faster.

Mr. Gault, with a friendly smile, laid his hand gently on Guy's arm.

"A thousand pardons!" exclaimed Guy, reddening a little. "I was dreaming, dreaming. Yes, I was dreaming."

"I observed it," said Mr. Gault.

The carriage continued its progress, at nine miles an hour.

"Nevertheless, we shall arrive," was the reflection with which Guy consoled himself. And, in fact, they did presently attain the outskirts of the great city; and Mr. Gault, in visible distress,

passed his handkerchief across his nostrils, as if, even at this distance from its polluted centre, there were some uncleanness in the air.

"If I am not mistaken," he said nervously, "there is a slight taste of fog in the atmosphere. It is by no means impossible. I have known very gross fogs in town quite as late in the year as this. If there should be a fog in the City, I could not possibly go on."

"I smell nothing," said Guy; "and see how the sun is shining!"

"We will hazard it for another mile or two," replied Mr. Gault. "Drive slowly through the streets, Johnson."

The carriage continued its progress, at five miles and a half an hour. "Nevertheless, we may still arrive," reflected Guy.

As they advanced farther into the town, an incontrovertible haze was seen slowly spreading itself over the yet distant central area. In the neighbourhood of Knightsbridge the haze gave place to a yellowish vapour of some density; and at Hyde Park Corner the sun was barely in evidence. It was owl's light, though not yet one o'clock: it was a fog. Mr. Gault protested that he could go no further, and the carriage came to a standstill.

"I am willing," said he to Guy, "to make any concession that you may demand of me, short of proceeding another step eastwards. Take the carriage; I will return by train. I will give you my card as an introduction to the gentleman whom we were to visit, or I will write a note to him here. Ask anything you will, but do not take me further."

The twilight began to deepen into darkness, and Mr. Gault, keeping his handkerchief pressed to his face, turned the handle of the carriage door. As he opened it Guy sprang from the carriage.

"Return at once," he said to Mr. Gault. "I will not detain you an instant. Your card is all that I need. Thank you. Now, good-bye! Expect me this evening. Home, Johnson."

"And quickly, Johnson!" urged Mr. Gault, from behind his handkerchief.

The carriage turned about, and vanished from Guy's sight, at twelve miles an hour.

Guy buried the card in his waistcoat, and felt in another pocket as a preliminary to the next step in his progress. The serenity of his countenance after this examination attested his comparative solvency.

He was not, however, in all respects so well satisfied with himself as he had been a few moments before. His descent from the carriage to the pavement had taken a little of the colour out of his prospects. The carriage itself would have counted for something in the first stage of the affair. However, the carriage had detached itself from all participation therein, and the scheme must therefore dispense with its assistance.

An omnibus faring eastwards (at four miles an hour) drew up at the corner, and Guy mounted to the knife-board. Despite his inward protestations to the contrary, he did not feel so sure of his financial genius on the omnibus as he had done in the carriage. What annoyed him more was to observe the unmistakable change for the worse which his elevation to the knife-board had effected in his personal appearance. Decidedly, his clothes were shabbier than he had supposed.

"This is unfair to Rohand!" he thought, with a twinge of self-reproach.

The fog grew denser as the omnibus dragged slowly eastwards, and Guy grew less enamoured of his genius for finance. He would have given two hundred of the company's shares to be seated again on the downy cushions of the carriage.

At the Mansion House he got down from the omnibus, with that vague confidence peculiar to the child of fortune when he does not precisely know what is going to happen next.

There is a red-headed constable of the City police, standing six-feet seven (or less), who does duty outside the Mansion House, and is assiduous in his attentions to strangers.

Guy, whose six-feet one were dwarfed beside this flame-coloured Anak, inquired of him how far he was from Farringdon Street.

"Ye're no sae far in a gude licht, sir, but it wull be aboot twalve or saxteen minutes in ta' fog. Gang richt awa' down Cheapside twall ye come till the prison; hau'd on then till the kirk o'—'

"The Mansion House, no less! Who but myself could bring you straight to it in a fog! Threadneedle Street's not the breadth of your hand from us now."

This fragment of brogue cutting in upon the lingo of the Scotch policeman made Guy start as if a needle had been thrust into his wounded arm. It was not so much the brogue as the speaker. He turned quickly in the direction of the voice, and fancied that Dr. Phipson Rae with Trona on his arm disappeared in the fog not five yards ahead of him. Without waiting for the completion of the constable's directions he started off at once on the route precisely opposite to that which Rufus was so politely laying down for him. In two moments he was lost in the Sahara of fog which was bounded by the Mansion House on the south and the Bank of England on the north. Hoarse cries, muffled by the blinding mist; the roll of invisible wheels, and the thud of invisible hoofs besieged his ears. It was a midday nightmare—the nightmare of a City fog on a summer's day.

"Fog or no fog, there is nothing ghostly about Phipson Rae," said Guy; "and I am positive that I heard his voice. What is more, if Phipson did not pass me just now, with Trona on his arm, there is nothing real under the sun."

"Keep a tight hold of me, now, and don't carry on that way. Don't I tell you that Threadneedle Street's within two strides of us? I know by the itch I have in me pockets that we're almost under the walls of the Bank."

"Phipson!" shouted Guy. "Phipson Rae, answer me at once."

The echo of his own voice, distorted by the multitudinous vague roar of the murky circus, was the only response vouchsafed to him.

He paused on the refuge in the centre of the circus, baffled beyond words. Summoning his learning to his aid, he recalled a hundred instances of travellers who, on lonely mountain-heights, or

in desert wastes, had been lured—sometimes to their destruction—by "airy tongues" that syllabled strange things, and seemed to shape themselves from nothing.

What fog-sprite had cheated him so villainously? How should Trona be arm-in-arm with Phipson Rae, between the Mansion House and the Bank, in a fog?

He found himself presently on the *terra firma* of Cornhill; traversed that thoroughfare and Lombard Street, and then traversed Lombard Street and Cornhill; and arrived once more at the Mansion House. Not another sight or sound of the unaccountably united pair, Trona and the rising ophthalmic surgeon. Guy stood, bewildered and seriously annoyed, under the shadow of the Mansion House, with his back to the Scotch policeman, by whom he did not wish to be recognised again. A poignant hunger improved his sense of the unworthiness of affairs in general, until, by thrusting his hand into his pocket, he received the not too familiar assurance that luncheon was within the range of the attainable.

He had, to be sure, brought a little of M. Rohand with him; but not for the gross purpose of his own regalement; and he could not but reflect, in addition, that he had no right to submit M. Rohand to a test of this severity. He was always especially nice on the point of honour where M. Rohand was concerned.

Some clock which he took to be that of St. Paul's struck two, and Guy plunged again into the fog, this time in the direction in which Cheapside appeared to lie. In a steaming Cheapside restaurant, built and adorned in the style of a healthier age, and offering a bill of fare of which every item was an outrage on the dietetic principles of Mr. Gault, Guy ate a Philistinian meal without remorse; and paid for it.

But he continued to be moody and out of patience; and began to think more and more seriously that the continued existence of Phipson Rae could be of no benefit to society; even though ophthalmia should become as prevalent as obesity.

"For all that," he said, counting over his bill again with a certain satisfaction in the extravagance of the total, "this notion that I have taken is ridiculous. I have been the victim of an hallucination. This preposterous fog, which has already deprived me of the prestige of a two-horse carriage, has in some way affected my eyesight and my hearing. Gault showed some wisdom, after all, in declining to face it. Phipson and Trona—pooh! They never set eyes on each other. I might as well pretend to have seen my mother arm-in-arm with Peter the Great."

He quitted the restaurant, and to insure himself against further hallucinations, took a hansom cab to Farringdon Street.

His business in Farringdon Street was with the well-known Colonel Capperley, that popular man. Colonel Capperley was the managing director of one of our greatest liquid food companies, that very successful company. He was a gifted man, and had often thought of becoming a member of Parliament, in order that he might talk to the other legislators about feeding the people on liquids. His ascendency over the shareholders of the company was such, that when he stood up to address them at the half-yearly meeting, regard for the feelings of the chairman alone prevented them from rising to their feet.

GUY HAS AN INTERVIEW WITH COLONEL CAPPERLEY.

He was in his private room in the offices of the great Company, lunching on a lobster sandwich and a little dry champagne, because of the fog. Colonel Capperley was nearly as tall as Guy, but much stouter, riding seventeen stone at the head of his regiment of Volunteers: bald, smooth-shaven, and florid; a popular man, and very gifted. His splendid success as a colonel of volunteers, a managing director, and a man, owed something to his rare quality of accommodation; and when Guy

excused himself from assisting with the champagne, Colonel Capperley showed an amiable readiness to finish the bottle.

"This is shocking weather for servant-maids, Mr. Warwick," he observed.

"For—?"

"Yes; and to think that there are more than two hundred thousand of them in London at the moment while we are speaking! Have you any idea, as a man who has so deep an interest in the general welfare, how many servant-maids would be annually saved to London by the total abolition of basements?"

"Not the slightest," answered Guy.

"Neither have I; though I should think that the number would be considerable. The document under your hand is the statement to be presented at our next meeting. No, I won't trouble you to read it—a dividend of eleven per cent. You observed, I daresay, the progress we are making in Paris? And your own little matter, Mr. Warwick?—we are always pleased to receive a new suggestion; though you would hardly credit the number of proposals that reach us through the post every day of the week. Since we started, five years ago, the yearly delivery of letters in the London postal district has risen to two hundred and ninety-seven millions."

"Of which you receive—?"

"Our share, Mr. Warwick, our generous share. Only this morning I am in receipt of a letter from a widow woman in—"

"It is gratifying," said Guy, "but it is not enough. No, it is not enough at all. Since we are on the subject of figures, I must remind you, Colonel Capperley, that the population of Europe alone—to say nothing of Asia, Africa, and America—is considerably above three hundred millions. Now, when I have said twenty words to you about this scheme of mine, you will perceive at once that the whole three hundred and odd millions of Europe—leaving out of account for the moment the innumerable millions of Asia, Africa, and Am—"

"My dear Mr. Warwick, I catch your drift, and your enthusiasm charms me," interposed Colonel Capperley, in the rich baritone which had been so remunerative to him as a managing director, an officer of Volunteers, and a man. "But commerce, happily or unhappily, is commerce; and the first condition of success in that department of life is a knowledge of the limits of—"

"I know, I know!" said Guy. "But follow me a little further. There are twenty thousand persons annually committed by the magistrates of London for drunkenness and disorderly conduct."

"Are there indeed so many?" said Colonel Capperley, gravely. "But the number, I think, is rather smaller than it was before the principle of non-alcoholic liquid food—"

"But that is not my point. I—"

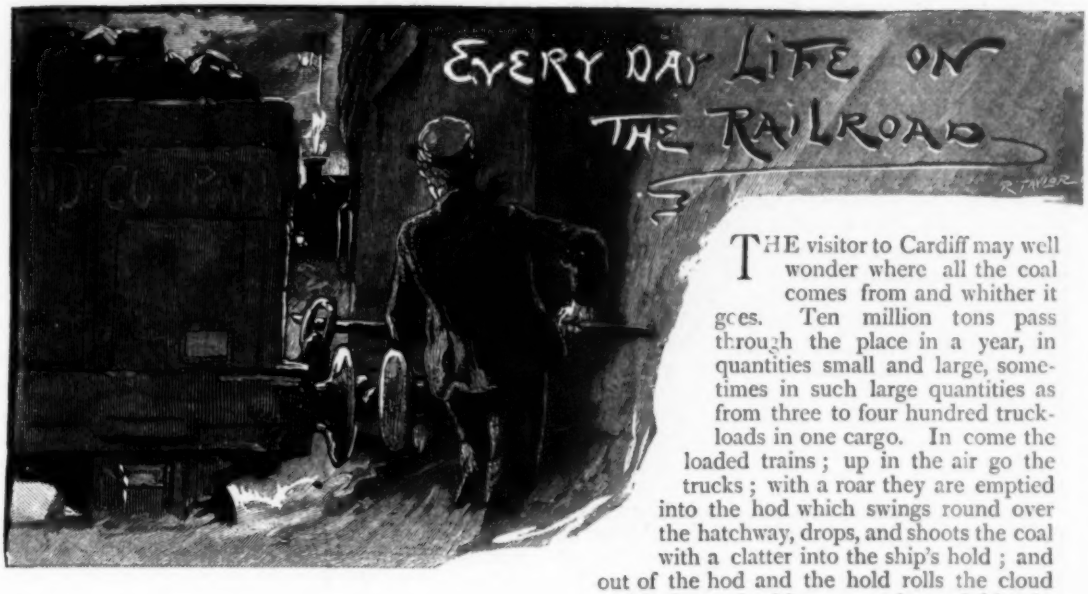
"Then (pardon me for interrupting you!) here is another example. There are about two thousand miles of piping for the gas supply of this city. Now, on a modest computation—"

"But there again—" exclaimed Guy.

"I wish," said Colonel Capperley, finishing his luncheon as he spoke, "that you would show me a sample of your preparation."

A quarter of an hour later, Guy was on his way back to the manor-house. His air was indeterminate. Sometimes he frowned, and then again he smiled. From the Ludgate Circus post-office he despatched a post-card to Mrs. Warwick:—"It begins to be in train. Have just been in conference with an important person in town. He talked a great deal of balderdash, *but saw and tasted it.* I am certain he was impressed, for he declined to taste it a second time until he had had it analysed by an expert. Left some with him for that purpose. A report to be made, so nothing now but to await the expert's encomiums in foolscap."

Then he strolled to Waterloo, and having carefully governed his expenditure to that end, he found in his pocket the precise value in pence of a third-class fare.



In the sunny south garden of the manor-house—Trona's own garden—Trona was seated at her tea-table, and Dr. Phipson Rae was eating muffins on a stool beside her.

They both exclaimed pleasantly on seeing Guy, but Guy let his sternest glance fall upon Phipson.

"My cousin!" said Trona sweetly, indicating the doctor. "But I think you know each other. I have been telling my cousin all about the great scheme, Mr. Warwick. He is going to dine with us this evening."

"Your cousin! Dine with us! I never heard of such a—What have you done with your aunt, Phipson?"

"D'ye know now, Trona," said Phipson with his adorable brogue, "we're just the greatest little cronies that ever were, myself and Guy. Tell him not to fix me that way with his eye. Do you know, I gave my aunt the pinch of his powder that he left with me, and I didn't set eyes on her since. But I'm sure there's no harm come to her, Guy avick · she has a terrible fine constitution."

IN THE SIDINGS.

THE visitor to Cardiff may well wonder where all the coal comes from and whither it goes. Ten million tons pass through the place in a year, in quantities small and large, sometimes in such large quantities as from three to four hundred truck-loads in one cargo. In come the loaded trains; up in the air go the trucks; with a roar they are emptied into the hod which swings round over the hatchway, drops, and shoots the coal with a clatter into the ship's hold; and out of the hod and the hold rolls the cloud which is as healthy as a charcoal biscuit. "Keep off the edge of the quays, as the coal dust, especially in calm weather, makes the water look like land." Such is the prominent notice in the docks; it is so suggestive of the state of affairs that we need say no more.

One point of interest there is to us in the destination of the coal. We are so accustomed to see trucks of coal, and to see engines burning coal, that it comes as a surprise to find coal exported to a distant land and there used for railway purposes. Some of the Indian lines burn wood and local coal; some burn wood alone; but a few, like the Bombay and Baroda and the Gaekwar's line, actually import their coal from Cardiff; while the South Indian works its engines with coal from both South Wales and New South Wales.

The coal trucks at Cardiff are a sight to see, but yet they carry not a twentieth of the coal yearly hauled in this island. The mind refuses to realise the quantity. Averaging trucks at ten tons each instead of the usual eight so as to eliminate the sundries, 210 million tons, the year's haulage of minerals, would require 21 million trucks, which at 350 to the mile would extend to 60,000 miles. If the notice as to the water was enough for Cardiff, is not a row of trucks that would put a girdle two and a half times round the earth enough for a notion of the country's mineral traffic?

It is the easiest of traffics to work. The trucks are loaded full at the colliery and generally made up into complete trains, and these in due order run on to the main line to be dropped in detachments or run through to the terminus. Forty years ago the work of carrying goods was performed by the Pickfords and other carrier firms, who provided their own sidings and built or rented their own stations and stores. The railway company merely provided the road and the power, and hauled the trucks without any responsibility for their freight. It was the carrier who loaded and unloaded the goods, checked and weighed them, and handed over the trucks full or empty in a convenient position for the engine to get at them. Nowadays the companies are the carriers, and have control of most of the sidings and goods warehouses; but many of the trucks are the property of the colliery owners, merchants and traders, the arrangement being a survival from the old system. Usually these trucks are built and run subject to the inspection and approval of the railway companies; but the Midland, in their care against accidents, have gone further and become the owners of the majority of the trucks they draw. How the figures tell up! In the past half-year the Midland working stock is returned at 93,982 trucks, 2,966 carts and drays, and 3,847 horses. The Caledonian followed the Midland lead and began to buy up the private trucks on the line, but somehow the policy has not been pursued, rumour having it that certain of the private owners sold their second-hand trucks to the company, and with the proceeds bought other trucks to sell in like manner in continuation of a circle of profitable trade.

The coal traffic is now as aggressive as it is humoured; but it began in the quietest way imaginable. It literally stole on to the line. When it was proposed to accept it, one of the London and Birmingham directors exclaimed that there was only one lower depth to which his trade could sink. And in witness of his sense of shame there stood for years the screen at Weedon behind which coal was furtively transferred

from the canal barges to the highly superior company's waggons ! And to cover the coal from prying eyes the waterproof sheets came in, which are now used to keep the weather from the miscellaneous goods.

Taking even these sheets, what an idea they give of the magnitude of railway work ! A few years ago at the Midland sheet stores near Trent, there were drying rooms heated by steam in which 600 sheets could be dried at a time, and the numbers are not likely to have decreased. The strips of canvas twenty feet long were sewn together by giant machines, and then the sheet rubbed over with boiled oil and vegetable black, coat after coat applied with brooms, till it was cured and hung on a scaffold pole ready for lettering. Every company has its distinctive marks : the North-Western has its two red lines, the Northern its white and blue diagonals, the Midland its yellow edges, the Brighton its slender white cross, the South-Eastern its red cross, and so on. Each sheet is worth some two pounds, and requires frequent repairs—in fact, no sheet can be trusted to be sound even after a single journey.

It is curious to note how customs differ even on the railroads. In Belgium, for instance, the use of a tarpaulin for covering goods is specially charged for, it being one of the numerous little extras by which the nominal rates are improved. To "count" your goods the Belgian charges you a penny a ton, to weigh them he claims fivepence per ton, to "book" them he charges you twopence, to "label" them he charges you another twopence, to send the "advice" he charges you a penny, for the "use of the crane" he charges threepence per ton, for the "use of the tarpaulin" he charges you one shilling and sevenpence, and for "disinfecting the truck" he charges you a shilling. No wonder that the Belgian journalist considers that the railway charges should be "assimilated to the English model."

On this side of the Channel a good many people have been thinking that the reform should be the other way about, though the average receipts for each mile run might warn them to be careful in coming to conclusions ; for in France and Germany the receipts per train mile are more than half as much again as they are amongst us ; and even in Belgium they are greater, and there the expenses on the receipts are 59 per cent., whereas amongst us they are 52.

In this country the wages form 60 per cent. of the working expenses ; in Belgium they form 58 per cent., in Holland 49, in France 47. Here an engine-driver does not earn less than 5*s*. a day, on no Continental line does he receive more than 5*s*. a day ; so it is with the firemen, the Continental wages leave off where ours begin. The wages of our guards range from a guinea to 2*l*. a week, those of the Dutch guards range from 13*s*. to a guinea. In Germany the range is from 15*s*. to 26*s*. ; in Belgium the guard is made more of, and his wages range from 18*s*. 6*d*. to 34*s*. ; in France he may even rise to 38*s*. 6*d*. Our signalmen are paid from 18*s*. to 30*s*. a week ; the French signalmen are paid better, the range being from 18*s*. 6*d*. to 32*s*. ; but the German signalmen never rise above 23*s*. a week, the Dutch never above 22*s*., and the Belgian begins at 12*s*. and leaves off at 17*s*. 6*d*. Our porters are paid from 15*s*. to 24*s*. a week ; those on the Continent begin at 13*s*. and rise to 20*s*. The wages of our shunters rise to 26*s*. ; in Holland they stop at 22*s*., in France at 17*s*. A Dutch platelayer gets from 12*s*. to 14*s*. a week, a German from 12*s*. 8*d*. to 14*s*. 6*d*., an Englishman from 15*s*. to 23*s*.

In short, the wages are less and the charges are more. A Frenchman, Belgian, Dutchman, or German, is simply aghast at some of our food rates. Even from Wick by passenger train no fish costs more for carriage to London than three farthings a pound, while from Grimsby the bulk comes at five pounds for a penny, being just a fifth of what it costs to carry a living man. As with the fish so with the meat. From Aberdeen to London the highest rate is three pounds for a penny, and vegetables are carried the same journey for six pounds a penny ; bacon and cheese travel a hundred miles for eight pounds a penny ; and milk comes the seventy-seven miles from Swindon at the rate of a penny a gallon.

But we are trespassing on thorny ground ; let railway rates wait awhile, and let us return to our tarpaulin. Great is the variety of the goods it covers. They may be of iron measuring seven cubic feet to the ton, or they may be furniture bulking out to the astonishing cubage of 3,500 feet to the ton. But however miscellaneous may be the load, the tarpaulin looks dressy enough when new.

In the twilight of a summer's evening we recently saw six new trucks with sheets complete forming quite the prominent feature of a passing train. It was one of those trains which grow as they travel. It started with four trucks ; it picked up four more at a junction twenty miles away ; six more tailed on outside a great city ; and thus matters went on until thirty-eight were passing us on their way to the south. As the train went so would it return, but distributing trucks instead of collecting them as it came northward.

We were by a gate at a certain sorting sidings at least two hundred miles from Cardiff, and watching what seemed to be the solving of an interminable puzzle. The train glided along the curved outer edge of a wide gridiron of parallel roads, and headed in pursuit of the express which had left its steam still floating in the valley. Here and there on the gridirons solitary waggons were running as if racing each other. From a train to the right of us truck after truck was dropped off and sent travelling down sometimes one and sometimes another of the many parallel roads to meet at the bottom in very different order.

"Sorting and marshalling" is a mystery to many, but curious as are some of its problems there is little difficulty in understanding the principle. In the large stations the trucks are loaded in "train order," that is to say, a train, or portion of a train, is loaded at each platform, and when, as at Broad Street, they come up by the lift on to the high level, all that has to be done is to couple on the engine and drag them away. But all stations are not large ones, and "train order" is not universal ; and if it were, the order could not be retained over a wide

area of distribution. Not only then have packages to be sorted like letters, but trucks have to be sorted like packages ; and an interesting operation it is.

The popular notion of sorting is a miscellaneous hauling up one line and down another until the arrangement is satisfactory. That was "shunting" in its infancy. Nowadays time is too valuable to be wasted, and the time-saving gridiron system is in general use. Let us try to make the system clear without a diagram. Essentially the problem is :—Given an alphabet on wheels, how are we to arrange it in any particular series. Let us take it in confusion. Here are our letters—

B Q C D E R J L M A I O U Y T F H G N K S P V W X Z

all of which have to be dealt with one by one, as none of them can stand aside to let another pass. They represent a row of trucks on a single road with the engine at the B end ; to perform the task of arranging them in alphabetical order at one operation is manifestly impossible ; but by sorting them out into short lengths we can manage it in two, if we so fill our columns as to keep the letters in order of precedence. For instance, let us take B down the nearest road, and then as Q is some distance on in the alphabet let us send it down the next road. Send C down the first road after B, let D follow C, and E follow D ; R will of course go down the Q road, but J being an earlier letter than Q will have a new road to itself ; L can follow it, so can M ; A must begin a road, and I can follow it ; O must be sent down the M road, and U can follow it ; and Y can follow that ; T can follow R, and F can follow E, and H can follow it. In our first column we can now take nothing before H, in our next nothing before T, in our next nothing before Y, in our last nothing before I ; we must consequently begin a new column with G, and follow the G with N. K we can send after I and S after N ; P will go after K, and V W X can be placed in the T line ; and Z we can put after S. The state of affairs will now be—

| | | | | |
|---|---|---|---|---|
| H | X | Y | P | Z |
| F | W | U | K | S |
| E | V | O | I | N |
| D | T | M | A | G |
| C | R | L | | |
| B | Q | J | | |

Here are five columns or roads in none of which are the letters or trucks out of order. There are many gaps, but these we will fill up at the next operation. We will take away A and place it by itself. Then we will return for B C D E and F ; from the fifth column we take G ; from the first H ; from the fourth I ; from the third J. Our columns are now—

| | | | |
|---|---|---|---|
| X | Y | P | Z |
| W | U | K | S |
| V | O | | N |
| T | M | | |
| R | L | | |
| Q | | | |

and our line A B C D E F G H I J. Continuing the operation with K we gradually exhaust the columns and fill the line with the trucks in the required order. Let it be clearly understood that this is a purely imaginary train made up only as an example of the general principle, and dealt with just far enough to show the place of a sorting siding with a single gridiron.

Every great railway has its sorting sidings. The Midland sorts most of its goods at Chaddesden, near Derby, where the gridiron—answering to the columns in our example—consists of thirty-five roads, on which a train of forty trucks can be broken up and re-formed in four minutes, and from which there is despatched a train every seven and a half minutes during the twenty-four hours. The Midland "minerals" are dealt with chiefly at Toton in the Erewash Valley, where about four million tons of coal pass through the gridiron in a year. The Lancashire and Yorkshire sort on a large scale at Aintree ; the North-Eastern at Shildon and Blaydon. But the most famous sorting sidings in the North country are those on the North-Western at Edge Hill, near Liverpool, where there is a yard of 200 acres, with 57 miles of road, and siding room for 6,500 trucks.

At Edge Hill the work is done, not by engines or horses, but by gravitation, the trucks being sorted out as they descend a hill-side. On the higher ground are six reception roads with accommodation for 294 trucks ; connected with these by a "neck" is a gridiron of twenty-four roads on which over a thousand trucks can stand, and this, by other necks, communicates with four smaller gridirons leading on to the departure roads. The gradient varies from 1 in 60 to 1 in 115, the greater incline being when the trucks have to start singly and enter curves. Strange it is how, even in railway trucks, the rule of "no two alike" holds good. Here, under practically identical conditions, every truck has some peculiarity in its running ; and the examples are numerous enough to generalise upon, for the year's work through Edge Hill gridirons totals out to close on 700,000.

The shunting yard is said to be "the shambles of the railway man." At Edge Hill only one man has been seriously injured since this gravitation system was adopted. There is always danger in shunting, even if the stick be used which does away with the need of the man's placing himself between the trucks. Danger, however, is a matter of personal equation after all ; we have seen that individual trucks differ in their behaviour, and individual men differ more ; what is danger to one man is safety to another.

From the percentages of accident one would, however, imagine that shunting was not a particularly risky operation. There are half a million waggons working about the railroad every day in the year, and for the whole of last year the deaths of railway servants occasioned in connection with trains and by "the movement of vehicles" was 435, or rather more than one a day. The injuries are about seven times as numerous, so that, altogether, about 3,200 men come to grief in a year, being about one per cent. of the number employed ; but there is no doubt that this percentage, small as it is, is greater than it ought to be, and a feeling is

growing up that a system of automatic coupling should be generally adopted, which would have the double advantage of saving both life and labour.

Six years ago the railways of this country gave employment to 367,800 men; to-day, the railway staff is of course larger, but the 1884 record is worth remembering owing to its having been classified into the different occupations. It appears that Civil Engineers then formed ·03 per cent., being in exactly the same proportion as Storekeepers and Goods Managers; next to them in number came Accountants and Cashiers, forming ·04 per cent., the same percentage as Superintendents. Managers and Secretaries formed ·05 per cent. Draughtsmen formed ·07 per cent.; Agents formed ·23 per cent.; Gatekeepers formed ·44 per cent.; Policemen ·48 per cent.; Ticket-Collectors formed ·56 per cent.; the Refreshment Department claimed ·68 per cent.; Foremen formed ·79 per cent., and Inspectors and Timekeepers ·96 per cent. The Telegraphic department occupied 1 per cent.; Stationmasters formed 1·68 per cent.; Engine-drivers formed 3·5 per cent., being just a trifle more numerous than the Firemen; Guards formed 3·62 per cent.; Signalmen and Switchmen together formed 5·17 per cent.; Platelayers formed 8·11 per cent.; Clerks 9·15 per cent.; Porters formed 12·13 per cent.; Artisans 15·21; Labourers 19·14; the rest of the staff, including the steamboat and canal services worked by the companies, being accountable for about 13 per cent. The most remarkable thing about the railway service is the number of leaders who have risen from the ranks, there being hardly a head of a department who has not been through the mill. Some have even started in the goods yard at fifteen shillings a week.

The railway staff can be divided into four departments, those of the Superintendent, the Goods, the Locomotives, and the Engineer. The Superintendent's department includes the guards, ticket clerks, porters, signalmen, and most of the men who are before the scenes in railway work. To it belong about 21 per cent. of the staff; to the Locomotive department, which is chiefly represented in public by the drivers and firemen, there belong 37 per cent. of the staff; to the Engineers department, rarely in evidence except in the person of the platelayers, belong 23 per cent.; to the Goods department, which is much more under observation, there belong 19 per cent. Taking the whole staff, it is not too much to say that two-thirds of it exist behind the scenes and are never even dreamt of by the railway traveller.

The goods-yard porter is not the least important of railway workmen. The carriage-washers, the men with the broom and bucket, and the cleaners, the men with the brushes, have a far humbler task as the railway housemaids. On a well-managed line the passenger carriages in use are washed outside and cleaned inside every day, but there are lines on which it is evident the will has to be taken for the deed. How many varieties of vehicle pass under the washer's broom in a day we know not; but if a specimen of each from the earliest South-Eastern to the latest North-Western were sorted up into a train, the train would be a long one.

And not only have the carriages to be cleaned, but, like the trucks and brakes, their machinery has to be examined; and though all may seem to be right, yet at intervals they have to be returned to the repairing shops to be thoroughly overhauled, and even if nothing else be wrong to have their springs tested.

One of the most interesting shops at Swindon is that in which the springs are tried. No matter how good the metal may be, there is always a danger that alternations of temperature will cause it to assume the crystalline state; and hence the need of occasionally heating it to keep it in condition. To see the heavy springs brought in and have the band pushed off them as if it were of cheese; and, on the other hand, to see the completed spring put in a press and tested to a dozen times, perhaps, of what it may be expected to bear, is to witness an experiment in quiet strength that one is not likely to forget.

Here is the spring on a bed with its ends fast against two blocks, and the ram advancing at its centre. "Will it bend it straight?" we ask. "Yes," replies the foreman; "look!" And the spring is held with its plates perfectly straight and parallel. "I will show you what we can do," continues the foreman; "bring that long spring here!" One of the most powerful springs is laid on the bed and fastened in the blocks. "Now!" Out comes the ram, the spring is bent until it is straight, and still the ram advances and bends it as much outwards as it bends inwards in its normal state. Again and again see-saw goes the ram; and the spring is removed from the block having lost not one whit of its original curve. Close by there is a beam balance some six or eight feet long, on which the weight in tons the spring will bear is being found. Every corresponding spring in a carriage or an engine must give at the same weight; were it otherwise the running would be unequal.

Swindon has one shed which cannot be much smaller than Olympia in the ground it covers. It is a hospital for goods trucks, with the papers on the patients instead of on the wall at the heads of their beds. Close to this big fellow there is one of more ordinary dimensions, to which the passenger vehicles come for repair, and here the most noticeable features are the lifts for taking the bodies off the bogies so as to deal with them separately. The Great Western has a class of carriage unknown on any other line. It runs narrow gauge bodies on broad gauge frames in order to be ready for the inevitable day when the broad gauge will cease to exist. That that will not be long in coming is apparent enough from the Great Western track. Look how rusty is the outer rail compared with the inner one on which run the narrow-gauge wheels.

But the battle of the gauges is over now, and nearly all that is left of it is the sharing of New Street station on easy terms by the Midland. The word narrow gauge is obsolete as meaning 4 ft. 8½ in., and we now speak of "national gauge"; and the historian tells us how the national gauge arose from the measurement of country carts found wide enough to pass each other in a lane.

The crisis of the battle was in the West. Was the broad gauge to run from Bristol to Birmingham, or was the national gauge to run from Birmingham to Bristol? Which was to have the traffic from the Midlands to the West? Was it to be Great Western or Midland? The Great Western offered to buy in share capital, the Midland offered a six per cent. dividend on the old capital; and, needless to say, the Midland won. Whereupon, the North-Western, which had been backing the Midland in keeping the Great Western from coming up the Severn valley, compromised its guarantee regarding the yearly loss on the six per cent. arrangement for perpetual admission of the Midland into the new Birmingham station at the nominal rent of £100 per annum. For three years the Midland lost money on its six per cent. plunge, but since 1848 it has been on the right side, and the New Street bargain has not been a bad one.

The Midland has done much for railway progress. By winning this gauge battle it gave the country a national gauge, and by saving transhipment at break of gauge reduced the cost of transport. By abolishing "expresses" and "special expresses," it led the way to the uniform fares now adopted by nearly every other line. By the introduction of "third class by all trains" it began a new era in railway management which it has further done much to develop by the abolition of second class, the importation of the Pullman Car, and the great improvement of third-class carriages.

The Midland startled the railway world with "henceforth third class by all trains" on April 1, 1872. Gradually the policy has been generally adopted, and on October 1 last even the Great Western hauled down its flag of exclusiveness and joined the popular movement by sending all three classes by the Dutchman and the Zulu.

The advance of the Great Western has been one of the notable features of railway history. Twenty-five years ago, when the late Sir Daniel Gooch became its chairman, its mileage was 1,256 and its dividend was 2 per cent.; it has now almost doubled its mileage and more than trebled its dividend, and its receipts from its passenger traffic alone are as great as they were then for passengers and goods combined. And as it has advanced in prosperity it has abandoned its original gauge. Its new engines, like its new carriages, are all convertible, and require only the shortening of their axles to fit them for the new conditions when it will lose the three-lined tracks which now complicate its sidings in the west.

W. J. GORDON.

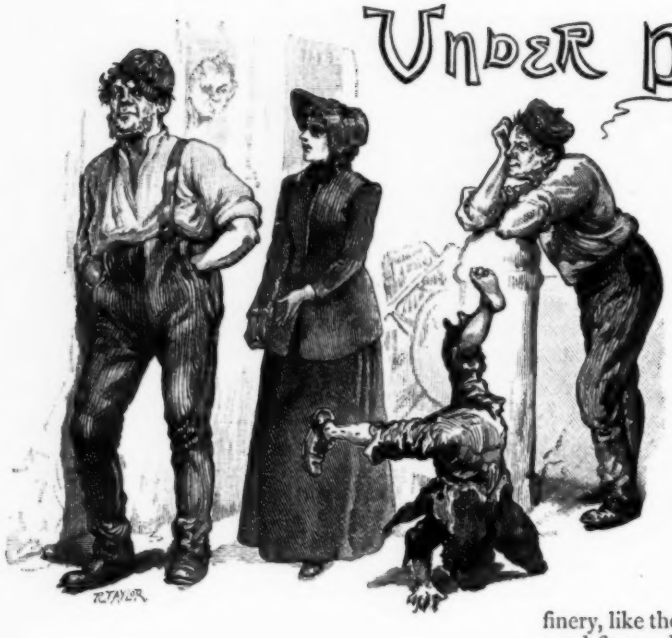
## Grown Old.

WHAT noble deeds we meant to do
When—in our long-lost childhood's days—
We planned how we would travel through
Life's tangled maze!

How very great we meant to be,
The whole wide world would hear of us;
And to our fame would all agree
Unanimous!

And we would be so very good!
All who were suffering or opprest
Would find their sorrow understood,
Their wrongs redrest!

While love would crown our nights and days
Deeper and fuller each glad year,
We look out on Life's unknown ways,
And know no fear!



Now one by one the years have passed,
We are no longer glad and young;
We fold our hands for rest at last,
Our songs unsung.

We look back, while our hearts are bowed—
The noble deeds are still undone—
Glad to have helped, amidst the crowd,
Here and there one.

Love parted from us unawares,
The fame and glory never came,
We thank God if some in their prayers
Still breathe our name!

VIOLET M. KING.

# Under Discussion

## "IN DARKEST ENGLAND,"

### OR, THE GREAT PROPOSAL.

BY THE AUTHOR OF "VOICES FROM THE HIGHWAYS," ETC.

"I DON'T know what is to become of London! I cannot go there for a day without seeing sights and hearing facts which haunt me for months. I think I should go mad if I had to live there! Yet, sometimes, I think that Liverpool is even worse. Or perhaps the appalling squalor and destitution strike one more when one arrives fresh from colonies where one never sees an ill-clad or ill-fed person, and where any term of misfortune that may befall an individual is readily tided over by individual beneficence."

It was Mr. Bryant who spoke. He had been invited to our house to meet some of our own little circle. And the conversation had taken its colour from a paper in a little journal printed for private circulation, which had been brought in by our next-door neighbour, Mr. Hume. The article dealt with the main lines of a certain book that had recently excited our interest.

"Well," said that kind little man, "I never shall forget the sights we saw that time when we went out before dawn to do a little sight-seeing before Bank holiday got too lively for quiet folk. I never would have believed how many people had been sleeping in the streets! Most of them did not look like people who had roughed it all their days, though I can't say that they all looked as if it was only their virtues that had brought them down. Still, there's no knowing how the virtues may look when they cannot get a chance to comb their hair and wash their faces, to say nothing of their clothes. And what hurt and shocked me terribly was to see the number of elderly women among them: poor old souls, between fifty and sixty, some of them with a gentle sort of carriage about them."

"Yes, and in draggled old finery, like the last of a stock of clothes that had been good five-and-twenty years ago," said Mrs. Hume. "Well, I can understand only too well how many such women cannot hold themselves up in the struggle for life. They may have spent their earlier years in little house-keeping duties for dead fathers or forgetful brothers, whose wives cannot 'get on' with them. What can they do for themselves in a world where younger and abler women toil sixteen hours to earn a shilling? I can understand, too, how such may prefer the streets to the rough lodging-houses, at least till cold weather comes."

"I remember one grim story, which has risen on my memory like a nightmare ever since I read it," said Mr. Bryant. "It was of a man found dying on a seat on the Embankment, an elderly man; he had once been a solicitor in fair practice, but he had lost health and friends too, and for many months before the end came he had had no home at all, and the police knew him well in the parks and on the bridges. He did not seem to have sought or found medical assistance, but was a repulsive mass of disease. He lay down to die just under the lights of a huge block of buildings, in whose offices he had perhaps done business in happier days. I recollect that the coroner observed that there ought to be some kind of retreat into which, both for his own sake and that of society, a man in such a state could be compelled to retire."

"But all these tragic cases which arrest everybody's attention for a day," said Penelope, "are nothing compared with the great mass of suffering in the normal life of thousands. There are

thousands of people who never enjoy pure air, good food, or quiet rest. There are children who do not know what such things are, and adults who are little wiser. A friend of mine, who has been working in the East End for thirty years, assures me that in that period the physical type has been perceptibly lowered, that many of the children now brought within her sphere of help are palpably defective in brain power, and that the inferior forms of the head would strike even an unobservant eye."

"Ah! poor things, they suffer for the sins of their parents, and so the terrible succession goes on," said the Vicar.

"Not always for the sins of their parents," replied Penelope, with animation. "In such a state of things as prevails in the East End of London, such suffering may be the direct result of virtue! The child of the harlot and the drunkard may often be better fed and 'enjoy' more of the privileges of life than the offspring of those who aspire to better things. Let me give two or three cases in point. I know a widow, a well-spoken, genteel woman, who lives by shoe-binding. Her eldest daughter, a girl of eighteen, works with her, the younger one is still at school. They work from eight in the morning till past midnight, but their earnings will not secure anything but most insufficient and inferior food, and the shelter of one tiny room. There they all live, eat, work, and sleep. It measures about ten feet by ten, and is about eight feet high. It is approached down a narrow passage, through a ruinous dwelling-house, and its solitary window looks on the tiny yard of the said dwelling-house, the horizon being its insanitary and utterly objectionable out-buildings. Do you wonder that the elder daughter looks in the last stage of consumption, while the younger suffers from chronic 'enlargement of the glands'? Where are they to get the strength and energy which are the backbone of industry? I could take you to another house, where a widow works for her three children, and they all sleep under her washing lines. This woman is of the highest character and very tidy and painstaking. She tries to keep her children indoors to prevent their association with the foul-mouthed youngsters of the lane. Consequently her boy has chronic bronchitis, and one of the girls suffers from St. Vitus's dance. That woman has never had a chance in life of which she failed to take the utmost advantage. Yet this is all her outlook now. It is not so with all, yet I don't think the others are less to be pitied. Only two or three doors off there is another widow, who received three hundred pounds from the firm in whose service her husband accidentally met his death. Remember that such a sum is absolutely a fortune to such a woman. But not one penny of that money—or of anything it purchased—remained at the end of three months!"

"Dear me, what did she do with it?" exclaimed Mrs. Hume. It meant Mr. Hume's salary for a whole year and a half, and I reckon if such a windfall had come to that house, it would have been used to provide a start in life for each of the three Hume little ones, whose future was never absent from their mother's mind.

"Drink," was Penelope's succinct reply.

"But she could not have drunk up that large amount so soon," said the Vicar.

"No," said Penelope, "but she called in her friends, after the only poor fashion she knew, to mingle their mournings and rejoicings with her own. Then, when she was drunk, she was robbed, and that going on day after day can get through a great deal in three months. I am told that once or twice at that period 'sovereigns' were to be picked up in the neighbourhood of her door. Alas, alas! what a miserable and delusive fulfilment of many a dream of London as a perpetual 'Tom Tiddler's ground.'"

"Wretched, degraded creature!" sighed Miss Barwick.

"Poor, darkened soul," said Penelope, "she has a kind heart. She turns a mangle now, and it is almost all the furniture she has. She is generally sober, too, because she cannot afford to be tipsy, unless somebody 'treats' her. But all the stray cats in the lane are welcome to sit in front of her miserable fire. 'Poor things, a bit of warmth is all I can give them,' she says. You cannot think how kindly some of these people are, and what a vein of poetry underlies all their rough degradation. The other day, as I was going along a back street, I heard a voice say, 'Hi, miss, I've got a present for you. I've been looking out for it a whole year, but I've got it at last!' Turning, I saw a poor barrow-woman of a very coarse type and sadly inclined to lapse into drunkenness. She dived into her house, and coming back, put into my hands a china cup and saucer, painted with flowers and bearing the inscription—'May we meet in Heaven!' That woman needs help as much as do some of her more worthy neighbours. But it is help of a different kind. And help is needed, too, for people of even a far lower sort—such as make sport of the torture of animals, or slowly slay their own offspring for some paltry gain, or such as figured in that awful history wherein two men (they lived on the edge of my district) went out together for robbery and murder, but in the end quarrelled over their spoils, so that one slew the other and returned straight home to the dead man's paramour, who received him without question as to what had become of the other. Think what a way of life must underlie such a state of things!"

"It is appalling: it is ghastly!" cried Miss Barwick. "One cannot bear to hear of such things—to think of such people! It is too awful."

"But these people exist," said Mr. Bryant. "They and their state of mind and their surrounding circumstances cannot be ignored in any comprehensive view of our nineteenth-century civilisation. Nor can anybody, save God Himself, apportion how much of their degradation is due to their own sins and the sins of their forefathers, or to some act of thoughtless sensuality or oppression, or some neglect of social duty, on the part of our own forefathers or ourselves. There are aristocratic pedigrees which reveal, under all disguises, a terrible heredity of evil. We must not forget the striking story of how a certain name was noted for its constant re-appearance on all the black lists of a certain district in the United States. That family from generation to generation peopled prisons, poor-

houses, lunatic asylums, and reformatories. At last the diligent search of an inquiring mind traced them all to one foundling girl who had grown up homeless and disregarded nearly a century before. One could not get behind her, or one might have found a man and woman who successfully eluded all earthly punishment for the sin they managed to conceal—people who may have passed respectably in society and whose legitimate progeny may have been reared with every care and endowed with every gift of fortune. And how much society would have gained had it at once come boldly forward to fulfil the duty neglected by some of its individual members, assured that there can be no gain either to morality or to social well-being, by leaving the innocent to suffer for the guilty."

"Ay," cried Penelope, "those thoughts are always present with me when I am dealing with these poor people! I know they are low and rough; I know many of them have no idea of truth or honesty, and that more still hate work and seek only such coarse self-indulgences as they can hope to enjoy. But I cannot help asking myself, 'How do they come to be thus?' And I feel that, after all, their thieving is not half so dangerous or so deadly as the 'adulterations' of the 'respectable' manufacturer, or the 'manipulations' of the respectable shopkeeper, or the conveniently deaf ear which the Limited Liability Shareholder turns to every moral question which might reduce his dividends and compel his wife to curtail her mercer's account or himself to suspend his wine bill."

"Yes," said Mr. Hume, "that is precisely the point taken up by the writer in this paper I am reading. He says:

"'There is strong inspiration in the bare hope of any great scheme that shall reach down into the black depths of our social pit and draw forth to new life and light those souls that are sinking and struggling there. It is something for such an idea to seize on the soul of a nation! The problem of the situation is how to utilise this white heat of enthusiasm so that it shall not waste its forces and die down in failure and disheartenment. An earnest worker, of a quarter of a century's standing, has recently unfolded to us his views of what is wanted, and what he desires, and believes can be accomplished. Let us give his words the utmost and most genial consideration. Do not let us be content with that easy operation known as "throwing cold water." Let us give forth our doubts, let us frankly express our convictions and put forward our own suggestions; but let it be in the spirit of those who would say, "We are all agreed that this thing has got to be done: come, let us reason together on the best methods of doing it." What is desired is that every human being shall get a chance of honest and worthy living; and more, that such chance shall be always ready for everybody as soon as he is ready for it, though hitherto he may have thrust it aside.'"

TREASURE TROVE.

"But is not that offering a premium to vice and worthlessness?" said Miss Barwick. "Is it not interfering between these and their penalties?"

"No, no, a thousand times, no," cried Mr. Bryant. "Quite the other way. At present a false charity often connives at people being kept in places for which they are most unfit, because it is feared lest any righteous interference might doom them to utter destruction. Take, for instance, the case—

not wholly unknown—of some drunken and demoralised schoolmaster or doctor. He is often upheld too long for the interests of others, but generally he is finally dropped. Then, if in time he repents, he finds no earthly door is open to him, and he is driven from disgrace to despair! A chance of worthy and honest living for such an one does not mean immediate—nor possibly ultimate—restoration to his former status. It means the opportunity of hard humble duties in the discharge of which he may prove his repentance and patiently await what the future may bring."

Mr. Hume resumed his reading.

"The scheme which we are considering lays its foundation stone in this ever-open offer of worthy and honest life to each and all, however previously degraded. Its starting point is Shelter Homes and Food Depots, in which everybody can find a roof and food at the lowest possible price; yet, as it is wisely said, this is all very well for your outcast when he has got fourpence in his pocket, but what if he has not got the fourpence? It is therefore proposed to establish in connexion with each shelter a workshop or Labour Yard, in which any person who comes destitute and starving will be supplied with sufficient work to enable him to earn the trifle for his board. From the more casual employments possible to these places, it is hoped to gradually draft the workers on to regular Factories, to Farm Colonies, and to industrial villages in this country, and finally, in suitable cases, to Colonies beyond the seas. There are other suggestions for the application of divers other kinds of sorely needed help, and some of these suggestions are not the least valuable parts of the Great Proposal. The question that instantly arises is, how are these costly schemes to be maintained, and what work is to be found to occupy the workless hands. Here we begin to encounter practical difficulties. Great hopes seem to be laid on the collection of waste food and other household jetsam and flotsam. It is asserted that it is by no means an excessive estimate to assume that the waste of the kitchens of the West End would provide a sufficient sustenance for all the Out-of-works who will be employed in the labour sheds at the industrial centres. It is said that the amount of food gathered by an experiment of this kind was enormous, and that sometimes legs of mutton from which only two or three slices had been cut were thrown into the tub awaiting the collecting cart. Now if this is so, it ought not to be, and therefore we think that to take advantage of it seems like that very futile course of action, doing evil that good may come."

Mrs. Hume spoke as her husband paused.

"For my own part," said she, "I'm always sorry to encourage people to think they show charity by bestowing broken victuals or cast clothes. There seems something ungentle in offering others what one does not think good enough to use oneself. It does not seem to accord with the Apostle's words, 'In honour preferring one another.' Sometimes it may be done with clothes in a friendly sort of way, as we make down garments among our own children."

Mr. Hume went on with his paper.

"It is to be feared that waste—that outcome of all sorts of self-indulgence—will increase tenfold when people can hug themselves into the feeling that only the more goes in 'charity.' We note with sorrow that, in his zeal to utilise the results, our philanthropist himself deals very gently with waste. He only calls it 'next door to sinful. Yet he might be nearest to the effectual relief of want, if he turned aside for a while from its contemplation, to preach a burning 'crusade' against this very waste itself. Why should not a Household Brigade go from door to door daily to 'gather up fragments,' farthings, pence, shillings, pounds sometimes, which people might be induced to save simply by denying themselves little luxuries of food or dress which they are quite as well without. This money could be employed as direct wages *for work found for the workless in doing those things for ill-paid workers which now simply go undone.* That would be a charity twice-blessed—good for the soul of the giver as for the soul and body of the receiver. Of course, side by side with this might go on the collection of that necessary residuum of food which is useful for piggery or poultry-yard, of waste paper of every kind which has generally to be sorted, and of those articles which have become 'lumber' and which we are only too glad to get rid of. But it must not be forgotten that there are already many humble, independent workers in these lowly fields of labour, and that it would be scarcely fair to them that some great organisation, with all its superior appliances furnished by 'charity,' should swamp their industrious endeavours."

"Ah," said Mrs. Hume, "I know how that works! I was standing in a baker's shop one day when a gentleman entered. He had come from a boys' refuge to solicit orders for paper bags, made by the inmates. The baker answered that he got his from an old woman, who had supplied his shop for many years. 'Ah,' said the gentleman, 'but think of the lads with all their lives before them, many of them rescued from great dangers; and you see, we must have this work to maintain them while we bring good influences to bear upon them. You don't know anything about your old woman,—very likely she drinks—and if she doesn't, anyhow, it's getting late in life with her and there's an end. But think of these, with all their future before them, &c., &c.' I'm glad to say my baker was staunch, but I know many people would not have been."

"And yet what a false piece of special pleading it was from beginning to end," said Pleasance, "for what was the use of employing the lads in that which could stand them in no real after use? It was 'a little industry,' just suited, as so many are, to the feeble and the aged. But we are interrupting Mr. Hume."

He went on:

"We know that we stand looking down on a great morass of misery, which we wish to drain; but while we debate as to how this is to be done our first care should be to do nothing which shall cost the foothold of those picking their dangerous way on its very brink. We fear it is too roseate a view of things which declares that 'the thrifty, the

industrious, the sober, and the thoughtful are already very well able, for the most part, to take care of themselves.' In many classes the struggle for life is getting too hard for that. One slip, such as a long illness, or the bankruptcy of an employer, and where is one? We hear of thousands of answers to any advertisement for a clerk, and men in that position of life, and many others, dare not resist any imposition, because they know that hundreds, equally qualified, are eagerly ready to rush into their place."

"That is quite true," said Pleasance; "not long ago I chanced to pass through one of the streets near the Bank of England. Just ahead of me I saw something like a rush towards a particular house, and a struggle for precedence in entrance. As I drew near I saw a crowd pressing up the stairs.

WANTED A CLERK.

I thought that some dreadful accident had happened, or that there was a pursuit of some runaway from justice. Seeing a commissionaire, who was lounging opposite, I asked him what was the matter. 'Nothing at all, ma'am,' he answered, 'only the party that lives there has advertised for a clerk, and it's been going on like that all the morning.'"

"I believe that many of our little dismal suburban terraces could tell stories of disheartenment and privation, as pitiful as any to be found in the slums," said the vicar.

Mr. Hume went on with his paper:

"There is another side of this question. Though we must remember that nothing must be done to imperil those whose economic position is already so precarious, we must recollect also that the labourer of every class has all to gain from the removal of the dread competition of destitution. If there was some sort of readily available provision for the great mass of the unfortunate or the incapable, it would relieve those above them, who are now dragged down as swimmers would be by drowning men clinging round their feet. The 'market price' of labour is too often rated at the wage which the least competent labourer is willing to accept. And when any body of workmen make the most legitimate effort to improve their condition, one always hears 'comfortable' people remark that 'it is hard these should be discontented, when so many would rejoice to get their work, even on harder terms.'

"In any hope, however, of dealing with this residuum of helpless want, we must remember that we have to deal with human nature, and that even those who might be glad enough to accept any plank whereby to escape from the ocean of absolute want, might still refuse to settle down into a way of life that did not accord with their own futile ambitions and desires. The destitute clerk or shopman, driven into the Shelter Home, might yet escape into the first ill-paid opening that he could find on his own congenial line, in preference to learning the trade of a shoemaker, or handling a spade or hoe, in prospect of the over-sea colony. Many agencies and associations have already been formed for the help of people in such difficulties, and they have done good service to such as used them in a whole-hearted candid spirit. But they must be always easily defeated by human variety or obstinacy.

"Then, again, there are those among the poor—as among the rich—whose philosophy of life is 'Let us eat and drink, for to-morrow we die.' These will clog the wheels and hamper the progress

of any organisation, and though it may easily throw them out, and proceed in triumph with its more pliable material, still that is but leaving the real difficulty for somebody else to face at some later day.

"This brings us to one of the most interesting suggestions in the 'scheme' we are considering, to wit, the proposal for a Final Retreat for those who are found utterly unamenable, and whose very existence is inimical to society. The difficulty here is, how is such an idea to be carried out with Christian justice and charity? It would be comparatively easy in the case of chronic inebriates, many of whom are only too anxious to be saved from their besetting weakness. It might not be very difficult in those cases of perverse temper, indolence, or incapacity, more often moral than merely mental or physical, which may prove such a dead weight in a family, and which, where the struggle for daily bread is very strenuous, often suffice to turn the scale from independence to pauperism, by being the last straw which breaks the heart of the bread-winner. Yet such cases as these might consent to withdraw themselves to such an asylum, especially if it were possible (with a poor law existing) to make them realise that if they refused the offer, they should be left to stand entirely on their own feet, and accept the apostolic dictum, 'If a man will not work, neither shall he eat.' But when we come to talk about 'involuntary incarceration' secured by 'State regulation' in the interests of society, then we open deeply reaching questions. Who are the greatest enemies of society? Probably few thoughtful people would reply that they are those most likely to subject themselves to any given number of 'convictions' for crime, drunkenness, or vagrancy. Does not this part of this great scheme, therefore, lie open to the objection that, after all, mere 'poverty' determines who shall be affected by it? Will there not be a natural murmur of rebellion when it is seen that, after all, it is only the 'poor' wicked man, who in General Booth's words is 'no longer to be allowed to go in and out among his fellows, carrying with him the contagion of moral leprosy, and multiplying a progeny doomed to inherit the vices and diseased cravings of its unhappy parent'?"

"Well," remarked Penelope Boughton, "I don't suppose anybody here knows better than I do how large a part drunkenness and immorality and self-indulgence of all kinds play as factors of misery and destitution. And yet, to speak truthfully, I must acknowledge that the very worst man I ever knew, a man who seemed to have no moral consciousness, who lied and cheated as if lying and cheating were natural to him as breath and motion, who broke every heart and marred every life that fell under his influence, who filled his own house with an atmosphere of the vilest licentiousness, even seeking to injure and destroy those who strove to save his hapless children from his evil example—that man has made a huge fortune, and when he dies the local newspapers will give him columns of panegyric! It is a picture which the Psalmist evidently had often under his own eyes, but which somehow seems strangely overlooked in our modern presentments of the evil that is in the world. I ask myself sometimes, 'Are there many Christians who deal personally with such a man as that, and tell him plain truths about his spiritual position and prospects, such as the poor man hears so constantly?' The rich do not need the gospel less. Our Saviour Himself said, 'How hardly shall they that have riches enter into the Kingdom of God.'"

Mr. Hume went on again with his reading.

"We feel that it is impossible thus to save society in patches. London cannot be severed from Liverpool, Britain cannot stand apart from the Continent, the Old World cannot be uninfluenced by the New. Even 'darkest Africa' and 'darkest London' have a solidarity of which they do not dream. And certainly the 'classes' and the 'masses' are one body of humanity, whose interests and duties are eternally bound together. We don't infer that the wounded on a field of battle are necessarily the worst and weakest of the rank and file. They may have led a forlorn hope, while those who escape may have sat by the baggage waggons. It is so sometimes in the battle of life. There are some virtues which may stand in the way of a man's 'getting on' in this world quite as much as some vices. Does not Mr. Booth himself own that those 'dockers' have the best chance of getting employment who hang about the public-houses and stand treat to the foremen? It is strongly borne in upon us that the best scheme for the relief or the removal of existing misery will fail to accomplish its true aim, *without a simultaneous and strenuous struggle against the causes which have produced and are still producing it.* There will be no effectual saving of the poor from want until the poor themselves and the rich and the well-to-do also are saved from waste. We do not now refer to the mere waste involved in throwing away what ought to be used; but the waste which lies in idleness, in luxury, in that ever-increasing elaboration of the needs and comforts of life, until the very soul of humanity faints beneath its enjoyments, like Tarpeia under the ornaments for which she betrayed her country. What we deprecate now is the waste caused by the capitalist who thinks that men are of less importance than dividends; and we equally deprecate the waste produced by those workmen who will disorganise a huge industry and spoil thousands of their fellows' homes, in sheer wilful disregard of promises made and contracts entered into. While these things continue, 'the poor man' of to-day may be rising through 'shelter' and factory into a flourishing colonist. *But the place in the slum which he leaves vacant will be filled by another 'poor man.'*

"By all means, and without the loss of another day, let us combine to do our best among the spoiled lives lying at our feet, among children warped from their cradles, among neglected old age, and ignorant and helpless ignorance sweated to starvation. Only let us remember that an immense amount of good work has been already done in these directions, and yet the tide of misery rises only higher and higher. Something more and something different must be attempted if it is to abate. Occasionally we get an open demonstra-

tion of what generally goes on in secret and complex ways. We have heard a great deal lately about the success of the farm experiment made by Mr. Craig at Ralahine. It is adduced as a proof how similar schemes may prosper. But few dwell long on the cause of its final overthrow—the awakening of the evil spirit of gambling in the breast of one weak man. We hear that this spirit is entering into every department of life, that commerce and recreation are equally tainted by it. Wherever this is so, another fountain of poverty is unsealed, whence wretchedness must flow, swamping not only the guilty, but the innocent, whose destinies are entangled with theirs! Then we see other men in all classes of life, who, already possessing adequate incomes, will take on more and more work till they kill themselves. They do this because they and their wives allow their expenditure to keep pace with and overrun whatever they may earn. They practically commit suicide that their wife may have a carriage to drive in, or that they may have a manservant to open their door. On these objects they consume the profits of the work they seize, and for which other men seeking in vain are in their turn driven to suicide because they cannot find bread! Others rush into speculation, and then perhaps, ruined in their race for riches, drag down and trample under foot unnumbered helpless victims.

"It is comparatively easy to get people to give out broken victuals and old clothes, and even money (if they have over and above what they need for their own whims), but if they are asked to give up something which may in the end make these other doles less necessary, they generally turn a deaf ear and leave the crying voice in the wilderness. The common conscience soothes itself in the paths of self-indulgence by the fallacy that it does not matter much how money is spent: so long as it is 'circulated' it is 'good for trade.' This is the firm belief of most women and of the thoughtless majority of men. The rich make it their excuse, the poor find it a consolation. The lady who orders a trumpery ball dress to wear for one night thinks she has done a virtuous thing, beneficial to many people from the manufacturer down to the dressmaker. She fails to see that it would have been at least as 'good for trade' had she ordered ten serviceable dresses to be made for ten industrious women; or, as the root of the matter really is, had there been such a better distribution of her wealth in the way of increased wages and smaller dividends as would have enabled ten industrious women to procure their own serviceable dresses according to their own tastes and needs, and to provide things needful and fit for their own aged or youthful dependents. The fashionable lady does not seem able to understand that what is really thrown away is not her mere money, but the labour for which she pays, and which instead of being wasted on her whim should have been employed in the general interests of humanity.

A BRIDE.

"Let us hope that a fire of enthusiasm to save the lost, raise the fallen, and help the helpless is lighting up among us. But why shall we not bring it to bear also, with all its fervour, on our well-to-do men and our fashionable women, awakening them to the consciousness that what seems to them so harmless and so pleasant is slaying the bodies of their brethren and stultifying their souls? If we could create a public opinion which would make people blush to trail yards of costly silk on the ground behind them, to spend hundreds of pounds on an evening's illusive 'pleasure,' and to indulge in such puerile extravagances as that reported lately of 'a bedstead decorated with real pearls, with the owner's name in pearls on the top bar.' —If we could arouse a public conscience which,

without pledge or promise to any human authority, would pause over each item of expenditure to ask, 'Am I really the better for this? Is anybody else really happier?' and then, when these questions were fairly answered, to add this vital one, 'Is there nothing on which I can spend this money which I feel sure will do more good and ensure more happiness all round?'—then indeed we should be in a fair way to attack the difficult problems of modern society. It is such a mistake to think and act as if money must remain idle unless expended on demoralising luxuries—(and demoralising luxuries mean anything which does not conduce to the physical, mental, or moral uplifting of him who secures them, be he a millionaire or a dock-labourer). If this were taken as the standard of desirable living, it would leave room for infinite variety of taste, opinion, and feeling, and yet it would certainly set free vast sums of money, part of which might well be devoted to rescuing from existing slums, but the rest of which would go to facilitate new channels of life for that stream of humanity which has not yet poured downward into the morass of despair.

"If the old Gospel rule of conduct, 'Do unto others as you would that they should do unto you,' were made the rule by which each man strove to measure every action, and if it were distinctly realised that such 'others' include one's masters and one's servants, the neighbour in the next house, and the ruined profligate in the gutter, the tradesmen with whom we deal, one's own wife, one's own children and other people's children, and even children yet unborn, then it might be found that many difficult questions could be answered very easily, and without the moral dust and slime that often defile well-meant attempts to meet such problems on any narrower ground.

"Do not say it is a Quixotic dream! Do not say that the world will stand still for ever, if we wait for the redemption of the rich, redemption from selfishness, from luxury, from idleness, and from thoughtlessness. To say that is to deny the power of the Gospel, which looks for its final triumph exactly there. When Jesus said: 'How hardly shall they that have riches enter into the Kingdom of God!' it was the disciples who whispered: 'Then who can be saved?' The Master's answer came at once: 'With men it is impossible, but not with God!'

"Christ and Antichrist, or the Powers of Good and Evil, have been in the world from the very beginning, yet possibly they have never been drawn up in more formidable battle array than they are at the present day. And their battle must be first fought in each individual breast. Who shall conquer? Shall it be our True and Eternal Self, in whose existence some of us can scarcely believe; or our lower Self, who is ever present with us and pays the flesh its wages beforehand that it may hold it in slavery in the end? The value of any scheme for the benefit of society and the progress of the race must be always in the place it gives to the regeneration of the individual, made manifest by his recognition of the claims of the new spiritual life within him.

"Unless a man be 'soundly saved,' you have not secured much for him, though you give him a new suit and find him work, or actually furnish him with a University education. These things in themselves will not even raise a man out of the slums. For, from possession of them, ay, the very best of them, men have sunk down into the slums. The common want of all, rich and poor, the only help to save all from the temptations common to human nature, is the subjection of the old self to the new self,—the flesh to the spirit, wilfulness to the will of God.

"This brings us to a conclusion that might help much puzzled philanthropy, which often looks ahead, hesitating and wondering whether this or that scheme will really 'do any good.' That is not the first question. The first question ought rather to be, 'What is right for us to do?' It is not our duty to keep people on starvation wages, for slavery periods, and in wretched homes, because we fear—and perhaps not without some grounds—that they would squander better wages, misspend leisure, and destroy palaces if they got them to live in. Let us take care that we do our own duty.

"There was a time, not very long ago, when faith was too apt to forget works. Then followed a season when works imagined they could do without much faith. The ruin of many a brilliant vision and the dry bones of many an elaborate effort remain to show what that came to. But may not the time have come when we are ready to say, 'We will show you our faith by our works, praying that you may presently share our faith and join us in our works, and in greater works to follow'?

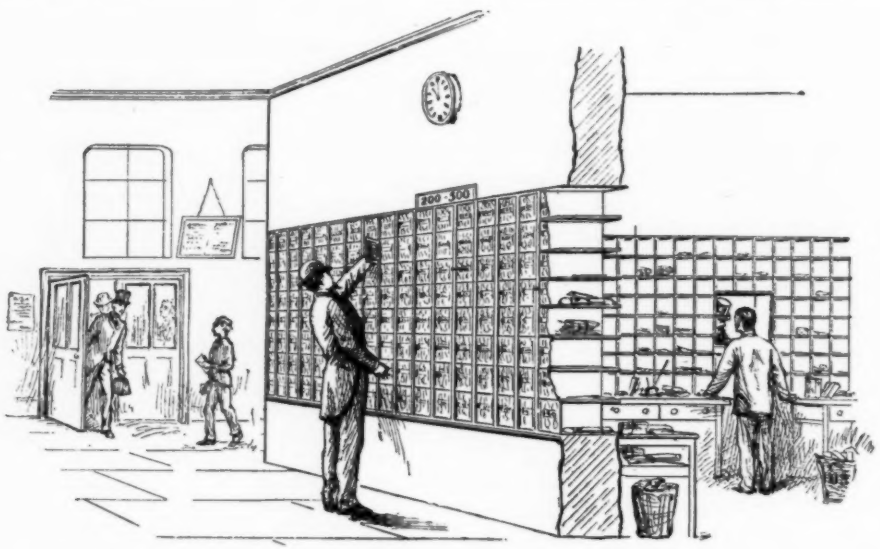
"Let us give sympathetic consideration to every voice that calls us out into the white harvest fields of the world. Let no theologic pride or sectarian prejudice deafen our ears or close our hearts. Let the thought of other's needs be ever present with us, and let us never rest content till some part of our life is sacred to their special service, and the whole of it set in lines compatible with their progressive welfare and their enduring joy."

"I say Amen to all that," said Mr. Bryant, solemnly.

"I am thinking of the eighth chapter of Zechariah," said Penelope Boughton, gazing straight into the fire.

"Ah, I am afraid that in these days few of us know our Bibles as we should," said the vicar, "or we should know that the inspired prophets and poets of antiquity are the strongest advocates of some of those views which are sometimes spoken of contemptuously as new-fangled ideas."

"Don't you think that the simplification of life, with the blessed freedom of mind and means which would ensue, is a subject for grave consideration?" said Penelope. "So many people get caught up in social vanities and expenses without seeing all they mean. And then they can scarcely extricate themselves. I know so many who profess to like the idea, but they say: 'It is so difficult to carry out.'"



"So is everything worth doing," said Mr. Bryant. "Is there any one brave enough to start a crusade to 'drain the morass' of riches and luxury, which swamps the souls of those who dance upon it?"

# "YANKEE DODGES."

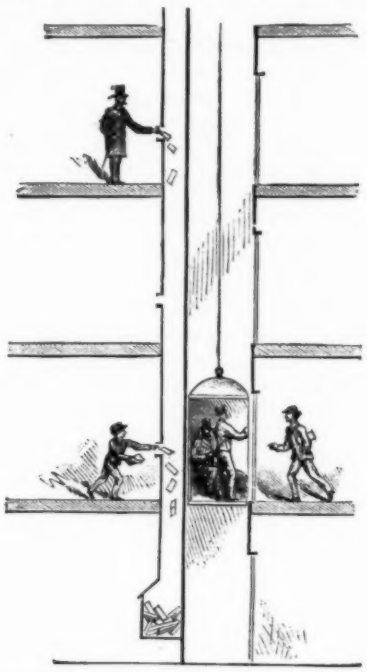
## BUSINESS LIFE AND THE PRESS.

### POSTAL ARRANGEMENTS.

BUSINESS life in New York is a scramble, although probably men appear to be in a greater hurry than they really are. They dive from elevated road to ferry, from ferry to tramcar, and from tramcar to elevator, as though they believed literally in the maxim about mischief overtaking the hindmost. Follow them into their offices, however, and you find them meditatively smoking a cigar and working calmly. The number of cigars which an average business man consumes during business hours must form a serious item in the petty cash account.

The offices are chiefly built in huge blocks, often thirteen or fourteen storeys high, and all furnished with elevators. In some offices there are six or eight elevators side by side, all fitted with indicators on every floor which record the progress of the cage, so that the breathless public may ascertain which of the doors will open the earliest to receive him. The rents of the top floors in these buildings are but little less than those on the ground, as the ascent and descent are made so easy and the top tenants also reap the benefits of quiet and light.

The feeling of "scramble" is heightened by the postal arrangements: business men could not possibly "wait around" for the postman to deliver their letters, so each firm has its private box in the General Post Office.



This system is universal in America, and has been introduced in many of our colonies. In the New York Post Office there are thousands of these boxes, each bearing a number, and clerks are sent over every hour or so with the key to bring any letters. The boxes are about four inches square and seven inches deep, and are arranged in hollow squares. They are open at the inside end, so that the post-office clerk inside the square may put any letters in, while they are closed outside by a glazed brass door, of which no one but the lessee has the key. In the middle of each range of a thousand or so boxes there is a window at which inquiries may be made of the official within, and whence newspapers, parcels, etc., too large to go into the box are delivered to the owner, who is notified of their presence by a card placed in his box directing application to the window. By this arrangement men with whom business is rather quiet can keep up appearances and relieve the monotony of existence by rushing to and fro to look for letters.

The street post-boxes are small iron affairs painted green, and generally affixed to a lamp post—very different from our magnificent military looking erections. The posting slot in the boxes is not very large, but if a newspaper or parcel will not go through the slot it is placed calmly on top of the box to await the postman. No one touches it, but presumably people do not post valuables in that way; still it is refreshing to be reminded of King Alfred and his bracelet-hung posts, in the nineteenth century.

Many of the higher offices are furnished with posting shoots running all down the building alongside

the elevator shafts, and provided with slots on each floor and one large box at the bottom, which the postman empties. Even sending a lad down the

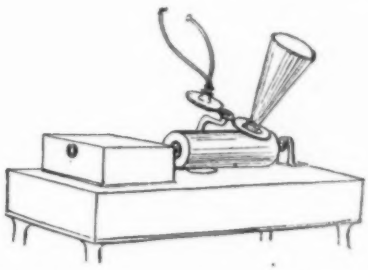
elevator to post letters would be too great a waste of time for the Yankee, who believes in working his brain and sparing his body.

### THE TELEPHONE.

Every office has its telephone, of course, and so, in fact, have many private houses. The householder is in direct communication with the butcher, baker, and candlestick-maker, and the process of "shopping"—at any rate for the vulgar necessities of life—is thus reduced to a minimum. The doctor is also on the telephone, and if the baby has the croup it may be held up to cough down the instrument into the experienced ear at the other end of the wire.

### MESSENGER SERVICE.

The "messenger" service is also a great institution, and a most convenient one. We have a similar thing in London, but on a very small scale. In America it is worked by the telegraph companies, for the telegraph is not a State business, as here.



The company fixes a call instrument in any office where one may be desired and keeps it in repair. You press the knob, and in about five minutes a messenger-boy appears from the nearest telegraph-office, where a large stock of the article is kept.

Like Aladdin, you order your genius to do anything you want—take a message, carry a parcel, show a stranger the way anywhere, convey a telegram to the office, and so on. The youth is provided with a table of charges for his services to any part of the city, and as the people at the office note the times at which he was called and at which he returns, and receive the fee from the boy, they manage to keep a check on the young gentleman.

These boys are the smartest in New York, which is saying a good deal, for on even the ordinary unofficial Yankee boy "there ain't no flies," to use a chaste and expressive Americanism. It is a common sight to see ladies doing their shopping accompanied by one of these boys, and they are certainly most useful. The companies make no charge for the boy's services if he be employed in carrying a telegram to or from the office.

### THE PHONOGRAPH.

"Long" handwriting is rapidly becoming a lost art in America, owing to the universal prevalence of shorthand and the type-writer. With these we are rapidly becoming familiarised here, but the American is not contented even with these lightning-

like servants. Apparently it will not be many years before the utilitarian stenography will follow its more graceful sister caligraphy into the realm of things which "have been," for Edison's phonograph is coming into extensive practical use.

The manager or letter-writer sits down before one of these machines and quietly speaks into its faithful trumpet the letter he wishes written. When the wax cylinder is filled it is taken off the "boss's" machine and transferred with its almost imperceptible voice marks on to that of the type-writer. This functionary places the hearing tubes into his (or her) ears, starts the apparatus at a speed suited to his type-writing capabilities, and writes the letter word for word as he hears it. Errors in dictation are noted by the type-writer hearing the letter through first at a high speed. Meanwhile his employer is confiding more correspondence to another cylinder.

The machine—which is generally worked by a small electro-motor—is made with a convertible transmitter, either receiver or reciter, so that if a firm has only one instrument it can be used first to receive a letter, and then, by reversing the swivel diaphragms, to reproduce it.

The wonders and possibilities of the phonograph—its uncanny weirdness and queer brazen tones—are well known in England, where it is still an exhibition toy: in America it is already treated with the contempt which familiarity breeds.

Probably the next step will be to abolish the type-writer and send the wax cylinders spoken on to by one business man to be read off by his correspondent, who will get not only his friend's words but the tone and expression he put into them.

Tinfoil imprints have been tried instead of wax, so that they may be sent easily through the post.

A very interesting and fairylike article by W. Bellamy on the possible future of the phonograph appeared in "Harper's" for October 1889.

### ADVERTISING.

The American propensity for advertising is well known, but beyond the multiplicity of street shop boards or signs, before alluded to, they do not seem much further advanced in the science of making a city hideous by advertisement than we do. The rocks at Harlem are painted with big letters about some one's chewing gum, etc., but the same sort of thing may be seen in North Wales, though,happily, not to the same extent.

### NEWSPAPER ARTS.

The newspapers, however, give our staid English journals many points in the science of "push." It requires some practice to find what news you want in an American paper. For instance, if information be sought as to the progress of a revolution—say in Brazil—one looks in vain for any heading "THE REVOLUTION IN BRAZIL," or even for a paragraph headed "FOREIGN INTELLIGENCE." What may be expected is something like this :

"GO!" AND THEY WILL GO.

Castelar Believes that Within Fifty Years This Will Be Said to Autocrats.

NO BLOOD WILL BE SHED.

("New York Herald," Nov. 20, 1889.)

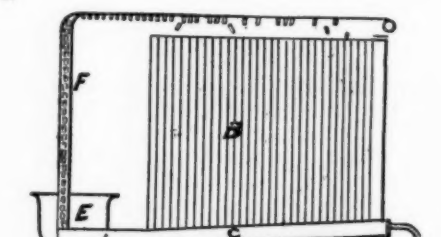
After a great baseball match one may feel anxious to know the result. It is useless to look for "NEW YORK *v.* BROOKLYN," but "GIANTS ON TOP! BRIDEGROOMS IN THE SOUP!" indicates the looked-for spot to the practised eye. This applies to the very best newspapers, and the genius who invents the headlines is a very important member of a journalistic staff.

The news itself is communicated in thrilling language interspersed with headlines after the fashion of the London "Star," though to compare that paper with a New York journal is like setting a volume of sermons alongside Edgar Allan Poe's works. The papers abuse one another freely in their columns and are not at all afraid of blowing their own trumpets. The titles of some of the country papers ought to be enough, however, to deter their rivals from evil speaking; who, for instance, would dare to be disrespectful towards the "Memphis Avalanche"?

Interviewing is the usual way of obtaining information for the press, and it is looked upon quite as a matter of course by the public. Lady interviewers and reporters are employed as well as men by most of the leading journals, in which they appear under their own names. For instance, a column may be seen headed

"NELLIE BLY INTERVIEWS MISS EASTLAKE,"

and will contain a minute description of the dresses and furniture and tea-things, as well as a record of a conversation well sprinkled with "My dears."



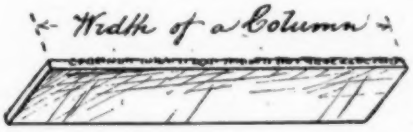
The aforesaid Miss Nellie Bly had just returned from a Jules Vernean voyage round the world, though, of course, she had beaten Phineas Fogg and done the distance in seventy-five days or thereabouts. She was on the staff of one of the New York dailies, which published accounts of her movements as she telegraphed them from the various points on her route. Besides this, in front of the office of the paper stretched a chart, about thirty feet long, of the world on Mercator's projection, and showing the circumnavigatress's route in red. A dummy figure of the immortal Nellie, "grip" (i.e. reticule) in hand, was pinned on to the chart and moved day by day in accordance with the telegraphed progress of the original.

In front of the same office is a large board on which the progress of baseball matches is indicated during the games. Every run made and almost the movements of each player is reproduced on this board, which is always surrounded by an excited crowd. The newspapers certainly understand the art of "getting their name up."

All the New York papers publish a Sunday edition, which is generally freely illustrated with zincotype pictures of indifferent merit, and which is of portentous size. Fifty pages is no uncommon number for one of these volumes, and they treat of every imaginable subject.

### THE LINOTYPE.

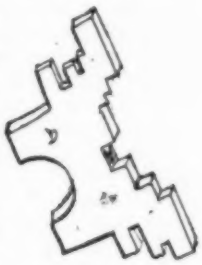
In the production of some of the leading New York papers an invention is in use which is still a comparative novelty in England, namely, the Linotype.



This real marvel is a machine about six feet square, and comprises type boxes, setters, and distributers, plus a type foundry.

The operator sits before the machine and spells out his copy by pressing keys (A) arranged like those of a type-writer. A set of flat vertical brass tubes (B), arranged like the pipes of an organ, hold the little brass moulds or matrices for the different letters.

Each lettered key when struck opens a door at the bottom of the corresponding tube, and lets one —but only one—matrix fall into an inclined pipe (C) which runs under all the tubes. A puff of compressed air admitted into the higher end of the tube blows the matrix down into a frame, where it is forced up alongside its predecessor by an automatic finger (D).



When enough matrices have been packed to

make a line of type (hence "linotype"), a bell rings, and the little frame, about three inches long, an

inch deep, and an eighth of an inch wide, slides along the machine until it arrives opposite the mouth of a large pot (E) of molten type metal, which is kept at a proper temperature by a gas jet. The valve closing the mouth is automatically opened, and a ram descending into the metal forces enough through to fill the little mould. The mould then separates and drops the casting into a planer, where the "runners" which have admitted the metal are planed off and the "line of type" trued up accurately, ready for setting up and stereotyping. All this is sufficiently clever, but the redistribution of the matrices into their respective boxes is the crowning feat.

When the casting has been made and dropped, the little brass moulds are separated and picked up by an endless band (F), which runs up from the foundry and along the top of the machine. The matrices are formed with wards like those of a key, and as they travel over the top of the machine they pass over all the tubes until they come to their own particular one, into which they drop. The tube wards allow each matrix to pass except the one belonging to it, and that one is intercepted.

The lifelike way in which the matrices march along over the top of the machine and drop methodically into their own domicile is so amusing that in laughing at it one almost forgets to admire the ingenuity of the inventor.

Should an insubordinate matrix attempt to drop off where it should not, it instantly finds itself literally in the "wrong box," for an electric circuit is completed, an alarm bell wrings, and the machine stops until the man looks along the line and finds that some wretched E has been trying to get into F's box.

The matrices last for years in spite of their many journeyings and heatings, and the machines appear to give but little trouble. A dozen or more are at work in the office of one of the large New York dailies, which is entirely printed by the linotype process, and is one of the best printed papers there.

The hand-compositors have in most cases learned to work the new machines, and do about three times as much work in the same time as with the old hand-setting.

The linotype is certainly one of the most striking examples of time and labour saving machinery in the world.

W. E. BUCK.

## A MUSICAL VILLAGE IN YORKSHIRE.

ABOUT forty years ago a manufacturer at Eccleshill near Bradford, who was fond of music, set his eye on a weaver who lived at Horsforth, near by, and who was one of the singers at the Wesleyan Chapel there. This manufacturer was interested in the New Connexion Chapel at Eccleshill, and he wanted a singer. The weaver in question, Fawcett by name, soon received an offer of employment from this music-lover. He thereupon moved to Eccleshill, and became the founder of a remarkable family of musicians, who are known all over the North of England as excellent orchestral players.

In a recent journey northwards I stopped a night at Bradford for the special purpose of making acquaintance with these plain, sturdy Yorkshire folk and of hearing the story of their lives. The Great Northern train lands one in a few minutes at Eccleshill station, and thence the walk to the top of the hill is soon accomplished. What a lovely view spreads before us! The chimneys of Bradford have been left behind, and we are in the land of dales and moors, of wood and stream. There is scarcely a yard of level ground, and one can understand how the hardy, robust natures of these hillmen are formed by their physical surroundings.

As we sit in the old-fashioned comfortable house of Joseph Fawcett, with a great oak beam crossing the ceiling, various members of the clan Fawcett are standing or sitting around. Most interesting of all, by his venerable appearance, is the old father, progenitor of the race, tall and spare, seventy-six years of age, yet clear of eye and mind, and full of pleasant recollections of long ago. In his young days women did not sit in the singing pews at the chapels. It would not have been considered becoming. He himself was a tenor, and learnt to read music by the old *fa sol la* system which prevailed in the time of Shakespeare. An old member of the Bradford Festival Choral Society, he went to London with the choir and sang with them before the Queen. He plays the violin and 'cello a little, but his work has chiefly been that of a choirmaster. The singing of glees by small parties of a dozen or so he well remembers. Those were days when a halo of celebrity hung round singers and players. There were so few of them that they were the envy and wonder of their neighbours. There was no tonic sol-fa then to make music easy for everybody. To attain the power of singing at sight or of playing an instrument demanded perseverance and self-denial. People had to puzzle

things out for themselves. Printed music was very expensive. Oratorios cost in guineas what they now cost in shillings. The consequence was that nearly all the music of these weavers was copied out by their own hands. Old Mr. Fawcett has sat up copying music till two or three o'clock in the morning. But when the music was copied and the performance came off, how the neighbours delighted! The "Messiah," or some other oratorio, would be performed with a band consisting of two violins, a flute, and a 'cello, yet the people of the village thought the effect perfect, and the performers showed no little pride in their work.

For years Mr. Fawcett senior, with his three sons John, Joseph, and Samuel, worked at their looms in their own house. This was the universal custom twenty-five or thirty years ago; every house in Eccleshill contained its loom, and the passer-by could hear the rattle of the shuttle. Steam-power has since crept in, congregated the weavers in factories, and destroyed some of the quaintness and domesticity of their labour. The peculiarity of the Fawcett household was that without neglecting their work, or weaving less deftly than their neighbours, they did a great deal at music. For years the lads, under the guidance of their father, practised singing or playing after each of the three meals of the day. Even while weaving they would sometimes stand their music on a shelf and cast glances at it from moment to moment, whistling or singing the notes so as to get familiar with them. The father was a good teacher. He not only had enthusiasm, and made his boys love their instruments, but he knew how to guide and control the waywardness and fitfulness which from time to time possess all young people. "He made us work," said one of the sons to me. "No shirking of difficulties was allowed. He was strict." Anyhow, the sons needed but little pressure in their musical studies. "Our mother," says one of them, "tired of the noise, has turned us out sometimes into the road at eleven or twelve o'clock at night, and bid us finish our practice there."

As a result of this training the sons of Mr. Fawcett senr. are now all players. John plays the alto trombone, Joseph the tenor trombone, Samuel the bass trombone, Tom the pianoforte and organ, and Handel, the youngest son, the double bass. This, however, is but the beginning of the tribe, for the three elder sons and their married sister, Mrs. Midgley, have grown-up children who are also players. Thus John has two sons in the profession: Harry, a violinist, and Mendelssohn, a clarinetist; while of his younger sons Handel, aged 14, promises well on the trombone, Willie, aged 12, plays the pianoforte, and Tom, aged ten, plays the flute. Joseph has a son Charlie, a violinist. Samuel has three sons: Charlesworth, a clarinetist, Verdi, a violinist, and Weber, an oboeist. Fawcett Midgley, the sister's son, is a bassoon player. All these lads had summer engagements last season at such places as Llandudno, Douglas, Saltburn, and Blackpool, where orchestras are engaged. So much for the players fairly started in life; there are a number of younger Fawcetts "coming on." Stepping into Joseph Fawcett's kitchen I find a boy of nine who is studying the clarinet, and "Joseph Haydn" aged three, who is handling marbles on the floor, will no doubt become a player in due time.

The Fawcetts are proud of their village. It has only 7,000 inhabitants, but it sends out more professional players to concerts in the North of England than Leeds, Bradford, or Huddersfield. My friend, Mr. N. Kilburn, Mus.B., of Bishop Auckland, who first directed my attention to the Fawcetts, writes: "I have known them for years. They are true and genuine homespun Yorkshiremen. At our oratorio concerts at Sunderland they have played to the number of nine or ten at a time. It was during a performance of 'The Rose of Sharon' last winter, as I looked across the orchestra, that the idea popped into my mind that this was almost a unique clan, and I resolved to call attention to them. They are not only numerous, but most efficient players." This group of Eccleshill musicians travel far and wide to take part in concerts. They play regularly in Leeds, Bradford, Hull, York, Scarborough, Sunderland, and Bishop Auckland and elsewhere. Joseph once went to Ireland with Meyer Lutz, and had some curious experiences at Cork during the Fenian troubles. John as a youth enlisted, and served twelve months in the band of the 68th Regiment, after which experience his father bought him out. Then he went into the Yeomanry Cavalry band.

It was in brass bands that as lads the Fawcetts began to play, and from this they worked their way to the higher musical level of the orchestra. For three years Joseph conducted the celebrated Black Dyke band, and at the present time he is training a brass band at Eccleshill. He has often acted as judge in the competitions between these bands which are so common in Yorkshire.

The remarkable thing is that this tribe of players are all self-taught. "Our music," says Joseph, "hasn't cost us a penny." Their father was the first teacher; then the sons have themselves taught their children. "The violinists have had a quarter or two's lessons," says Joseph, "just to get them into right habits. But if we don't play an instrument we know enough about it to set our children right, or tell when they are playing wrong." What sums of money we spend on music lessons, and yet here is a group of players who have taught themselves and done without! The teacher can only guide the pupil. The real effort is the pupil's own, and in an art like music quickness of apprehension and an observant eye count for much. But of course for ordinary people lessons are essential, and even for the gifted they save time and prevent the formation of bad habits which have afterwards to be cured.

If the West Riding is noted for its instrumentalists, it is noted still more for its singers. The love of choral music there is not an affectation, but a strong reality. The full and deep-toned Yorkshire voices are famed everywhere; and one reason why the Yorkshire folk are such good singers is that they are always singing. At the fireside, in the mill, in school, in church, in social gathering, their voices blend and commingle in strains now gentle, now tumultuous. John and Joseph Fawcett

are both old glee singers, and Joseph is at present choirmaster of the Congregational Church at Eccleshill, where he has a choir of fifty-four voices. He has held this post for twenty years, and much enjoys the work. The church has an organist as well as a choirmaster, and is about to spend about £800 on an organ, although it only seats from 800 to 900. Joseph is also conductor of the Eccleshill Choral Union—formed among the middle-class folk of the district, and meeting by turn at the houses of the members. His sterling musicianship thus commands the respect and allegiance of all classes in his native place. The time of the Fawcetts is thus chiefly taken up by music; but John and Joseph spend their spare hours in working at a little coal-selling business, which keeps them employed at times when music is dull. Instrumentalists have a more certain income than solo singers, because they are not afraid of their voices wearing out; and only by an accident—such as the loss of a finger, or serious illness—can their public work be suspended.

I have sketched these honest, intelligent, and artistic Yorkshiremen just as they are, because I think they teach a lesson of industry which thousands of working men may learn. They teach, too, the possibility of pursuing at the same time art and manual labour. We want more of our operatives to lead this double life, working hard at the bench, the machine, or with the spade or plough, and recreating themselves when work is over by music, which is the prince of diversions. Why should they not do so? The Welsh colliers and quarrymen form some of the finest choirs in the world. Come with me to the rehearsal of a French *Orphéoniste* Society in Paris, and notice the porters, policemen, and mechanics dropping in in their uniforms or their blue blouses, and singing away with great heartiness when the hours of work are done. When they have sung a chorus they will sometimes pick up a set of brass instruments, transform themselves in a moment into a brass band, and start a quickstep or an overture. Our English choirs, except those in Yorkshire and Wales, contain but few *ouvriers*. The men are clerks or school teachers, the ladies are scarcely any of them wage-earners. Why should it be so? If we shorten the hours of work, there will be more time for recreation, and occupations must be found for leisure hours which refresh and renew the faculties. Otherwise the strength of our workers will be dissipated upon occupations which exhaust and weary, which leave body, brain, and soul poorer than they found them. It will be a good thing in these coming days for the body politic if in hundreds of villages of our land the spirit of the Eccleshill Fawcetts stirs and grows. Others may not have time or skill enough to work their way to the position of professional players. This is the privilege of the few. But the many can learn enough of singing and playing to give pleasure to themselves and their friends in an endless round of social and public gatherings.

J. SPENCER CURWEN.

## WARREN HASTINGS.

FRESH and unexpected light has been thrown upon the life and times of Warren Hastings, by the recent publication, in Calcutta, of three volumes of the records preserved in the Foreign Department of the Government of India. These documents, edited by George W. Forrest, and issued from the Government Press, consist of selections from Letters, Despatches, and other official State Papers. For the first time the materials are afforded, in authentic form, for a continuous narrative of the rule of Warren Hastings as Governor-General. How far the sentence of acquittal is confirmed remains to be seen.

Even in those questions of the impeachment where there seemed proof of harshness and cruelty, it is now shown that the Governor-General acted under precise instructions, and was carrying out the existing system imposed on him by express treaties. In the sternest dealings with native rulers or subjects, the Governor-General used every personal effort to carry out decisions in as mild and merciful a way as possible. One extract will suffice to show the spirit by which he was actuated. To Colonel Champion, who said that he feared that the conduct of the Wazir of Oude "will render our connexion with him reproachful to us," the rebuke given in the reply of Warren Hastings was severe. He thus wrote:

> It never could have been suspected by the Board that their orders to you would have tied up your hands from protecting the miserable, stopped your ears to the cries of the widow and fatherless, or shut your eyes against the wanton display of oppression and cruelty. I am totally at a loss to distinguish wherein their orders have laid you under any greater restraint than your predecessors. No authority which the Board could have given could be capable of preventing the effects you mention, since they could give you no control over the actions of the Wazir further than the weight and influence of your counsel and advice.

The instructions which Hastings issued to the British Resident at the Court of Oude were not less firm:—

> Colonel Champion complains of the conduct of the Wazir in suffering, and even ordering, his troops to ravage the country, and in his cruel treatment of the family of Hafiz Rahmat. This is a subject on which I cannot write to the Wazir. It might widen the breach between him and the Commander-in-Chief, and probably influence the Nawab to some private revenge on the unhappy remains of Hafiz Rahmat's family. I desire, therefore, that you will take an immediate occasion to remonstrate with him against every

act of cruelty or wanton violence. . . . Tell him that the English manners are abhorrent of every species of inhumanity and oppression, and enjoin the gentlest treatment of a vanquished enemy.

Then follow threats, by which, if the Wazir failed to follow these instructions, the prescribed policy of mercy might be enforced upon him.

The popular estimate of the character and rule of Warren Hastings is mainly based on the rhetorical pages of Lord Macaulay's famous Essay. He took his statements from the unfair and partial misrepresentation of James Mill, the historian of India, and from the vehement invective of Edmund Burke's speech in support of the impeachment.

In connexion with this historical vindication it is very interesting to read in the correspondence of William Cowper, the poet, the references to the memorable trial in Westminster Hall. Writing to his cousin, Lady Hesketh, Feb. 16, 1788, he strongly recommends her to embrace the occasion and to put herself in the way of being squeezed and incommoded a few hours, for the sake of hearing and seeing what she will never have an opportunity to see and hear hereafter, "the trial of a man who has been greater and more feared than the Great Mogul himself." Lady Hesketh went, and having heard Burke's greatest speech, wrote to Cowper her impressions, to which letter he replied :

I do not wonder that your ears and feelings were hurt by Mr. Burke's severe invective ; but you are to know, my dear, or probably you know it already, that the prosecution of public delinquents has always, and in all countries, been thus conducted. The style of a criminal charge of this kind has been an affair settled among orators from the days of Tully to the present ; and like all other practices that have obtained for ages, this in particular seems to have been founded originally in reason, and in the necessity of the case.

He who accuses another to the State must not appear himself unmoved by the view of crimes with which he charges him, lest he should be suspected of fiction or of precipitancy, or of a consciousness that, after all, he shall not be able to prove his allegations. On the contrary, in order to impress the minds of his hearers with a persuasion that he himself at least is convinced of the criminality of the prisoner, he must be vehement, energetic, rapid ; must call him tyrant, and traitor, and everything else that is odious ; and all this to his face, because all this, bad as it is, is no more than he undertakes to prove in the sequel ; and if he cannot prove it, he must himself appear in a light very little more desirable, and at the best to have trifled with the tribunal to which he has summoned him.

Cowper's own opinion of his old schoolfellow at Westminster he thus expressed :

Hastings ! I knew thee young, and of a mind,
While young, humane, conversable, and kind ;
Nor can I well believe thee—gentle *then*—
Now grown a villain, and the *worst* of men ;
But rather some suspect, who have oppress'd
And worried thee, as not themselves the *best*.

The trial was dragged on, with many and long adjournments, for eight years ; and ended in the acquittal of Hastings. It is gratifying that documentary demonstration of his innocence of the grossest charges has been at length brought to light.

An interesting memorial of the rule of Warren Hastings, showing his attention to minutest affairs in his Indian Government, has lately come to knowledge. In 1888, copies of two of the works of Tsong-Kapa, one of the greatest of Tibet literary men, were discovered in an old Hindooised temple on the banks of the Hooglee, opposite Calcutta. These books, as well as the effigies of several Tibetan deities, had been deposited there about a hundred and twenty years ago by a priest or lama, whose services had been utilised by Warren Hastings for the conduct of negotiations with the influential Lama of Jashi-Chümpi in Tibet. The Governor-General provided the temple for the use of Tibetan traders at Calcutta at the request of the Grand Lama. These books are now in the possession of the Bengal Asiatic Society. Other works of the same Tibetan author, in much better preservation, are in the Oriental Libraries at St. Petersburg. These facts are mentioned in a learned and valuable article in the "Edinburgh Review" for October 1890, on "The Literature of Tibet."

# Varieties.

### Montyon Prizes for 1890.

The customary address, at the special annual meeting of the French Academy for distribution of the Montyon prizes, was delivered by M. Léon Say. The reputation of the ex-Minister for wit as well as wisdom as a speaker attracted a crowded audience, and expectations were not disappointed. Familiar as is the history of M. Montyon and the nature of his charity, M. Léon Say gave an eloquent sketch of the philanthropist, and told anecdotes which were new to many who heard them.

He had to take refuge in England during the Reign of Terror and the troublous times that followed. His generosity was extended to many of the poor refugees in London. He was thrifty and careful amidst his large beneficence. Hearing of a lady who said she had a prospect of recovering property in France, but was without money for the journey to Paris, he sent anonymously five guineas for her travelling expenses. When the lady returned to London to settle her affairs, before finally returning to Paris, where she had succeeded in recovering her property, M. Montyon asked her if she had endeavoured to find out the friend who had given her the timely assistance. She professed inability to discover the anonymous donor. M. Montyon said he thought that she ought, if possible, to restore the money which had enabled her to recover her fortune. "Can you assist me," she said, "to find the giver ?" "You need not go very far to find him," was his reply. "Then it was you ?" she said. "Yes, and I now beg that you will return me my five

guineas," which she did gladly. The incident reminds us of Benjamin Franklin's kind and prudent method of beneficence: lending money under the condition of being repaid by the same sum being lent to another who might need assistance.

M. Léon Say spoke with philosophical earnestness on the subject of pauperism and injudicious almsgiving. He attributed to the English Poor Law much evil in encouraging improvidence, as well as hindering true charity. He thought that the system of private beneficence recognised in the Montyon awards belonged to a higher order of charity.

He paid a high tribute to the character and efforts of those who, like Miss Octavia Hill, teach the poor to help themselves and to help each other—a nobler spectacle than "rates for poor relief by law" could ever exhibit.

Of the awards one of the most remarkable, the first *Prix de Vertu*, was the gift of 2,500 francs to the Abbé Béraud, of Blanzy, in the Department Saône et Loire, who had by his personal exertions and influence founded two orphanages and done many notable acts of beneficence. It was announced that the Abbé is now eighty-four years of age, that he can still walk thirty miles a day, and is a capital swimmer. He rescued several victims in a pit explosion, and he is the bricklayer and carpenter of his orphanages.

**Frozen Meat.**—It was not until the year 1879, when the Bell-Coleman machine was introduced, that the problem of keeping carcases sufficiently cold to preserve them during long voyages through the tropics was practically solved, and a commercial enterprise of enormous magnitude was started. In the year 1889, as he gathered from figures furnished by the Mayor of Derby, upwards of 195,000,000 lbs. of beef and mutton were imported into England from various parts of the world, and in the first nine months of the year 1890 upwards of 187,000,000 lbs.—*Sir R. Webster's address at Society of Arts.*

**Charitable Bequests.**—An important decision was lately given by Mr. Justice North in the Chancery Division of the High Court of Justice as to a doubtfully defined charitable bequest. The case is headed in the Law Reports "*In re* Barnard-Majendie *v.* the Duke of Northumberland." This was a summons by the executors of the will of the late Miss Mary Esther Barnard, of Woodstock, for the determination of the charity entitled to a charitable legacy bequeathed by her will. The testatrix, who died in 1889, among other legacies to charities, bequeathed a sum of £1,000 to the "Poor Clergy Sustentation Fund." There is no fund or society known by this precise name, and after the death of the testatrix the legacy was claimed by two societies—the one called the Church of England Incumbents' Sustentation Fund, the other called the Poor Clergy Relief Corporation. The Duke of Northumberland, Lord Selborne, and others, who are the trustees of the Incumbents' Sustentation Fund, were made defendants, and the Poor Clergy Relief Corporation were also defendants. Mr. Justice North decided that the legacy must be divided equally between the two charities.

**Military Uniforms.**—An exhibition of old uniforms of the British Army is proposed as a permanent feature in the museum of the Royal United Service Institution. This would be more than a curious display, for it would be useful to artists and to others who require to be historically accurate in describing wars and battles of former times. What uniforms our soldiers wore in the days of Marlborough, Clive, and Wellington will be interesting to all visitors, and it would be well to have some specimens also of foreign uniforms, such as Napoleon's Old Guard, and others met by British soldiers.

**First Attempt at Book-printing.**—In the autobiography of John G. Paton, missionary to the New Hebrides, he gives an amusing account of the printing of his first book in Tannese, the language of the island of Tanna. A merchant of Glasgow, Mr. Thomas Binnie, had given a printing-press and a fount of type. "Printing," says Mr. Paton, "was one of the things I had mentioned, but having now prepared a booklet in Tannese, I got my press into order, and began fingering the type. But book-printing turned out to be for me a much more difficult affair than house-building had been, yet by dogged perseverance I succeeded at last. My biggest difficulty was how to arrange the pages properly. After many failures I folded a piece of paper into the number of leaves wanted, cut the corners, folding them back, and numbering them as they would be when correctly placed in the book; then folding all back, without cutting up the sheet, I found now by these numbers how to arrange the pages in the frame or case for printing, as indicated on each side. Do you think me foolish when I confess that I shouted in an ecstasy of joy when the first sheet came from the press all correct? It was about one o'clock in the morning. I was the only white man then on the island, and all the natives had been asleep for hours. Yet I literally pitched my cap into the air and danced like a schoolboy round and round that printing-press till I began to think, 'Am I losing my reason? Would it not be more like a missionary to be upon my knees, adoring God for this first portion of His blessed Word ever printed in this new language?' Friend, bear with me, and, believe me, that was as true worship as ever was David's dancing before the Ark of his God! Nor think that I did not, over that first sheet of God's Word ever printed in the Tannese tongue, go upon my knees too, and then, and every day since, plead with the mighty Lord to carry the light and joy of His own Holy Bible into every dark heart and benighted home on Tanna!"

**Argentine Republic.**—Many a reader of the "money articles" in the newspapers and financial journals have inquired about the Argentine Republic, and the other remote regions of the South American Continent, which have absorbed vast sums advanced by English capitalists and bankers, and at the risk of causing widespread panic and disaster. The inquirer will find every information in that encyclopædic book, always at hand for reference in every house and office, "Whittaker's Almanack." The Argentine Republic is estimated to contain nearly a million and a hundred thousand square miles; with a population in 1889 of 4,200,000. There is a large seaboard on the east coast of the continent, and some of the provinces are rich both in mineral and agricultural resources. The capital, Buenos Ayres, has a population not much under half a million; in 1887 the number was given at 434,600. The chief cities are all connected with the capital by railways, of which 5,000 miles are in constant use, and the Republic is connected by cable with all the great cities of the world. In 1888 the revenue was 57,651,711 dollars, and the public expenditure only 50,801,631; with federal debt officially stated in 1889 at 119,450,782 dollars. The country would be prosperous if under good and settled government. The struggles of last year about the presidency revealed a condition of affairs which might well end in financial troubles; but with ordinary care and unselfish patriotism the prospects of the Republic should be hopeful.

**Mortuary Gold.**—A French scientist, M. Mennier, has made a curious statement about the quantity of what he calls "mortuary gold," or the gold annually lost in operations of dentistry, and buried in the graves of those who have worn false teeth. He estimates that the dentists of the United States use every year more than 1,800 lbs. of gold, by far the largest part of which is lost in the cemeteries, after it has served its useful purposes in life. He says that in a century the American cemeteries will contain a larger quantity of gold than now exists in France! We have recollection of a law in Ancient Rome forbidding the burial of gold with the teeth of the dead, but cannot now recover the passage—which perhaps some classical scholar or expert in Roman laws and antiquities can give.

**Piccadilly, Earliest Notice of.**—The first reference to Piccadilly in English literature is, we believe, in Gerard's "Herbal," published in 1596, in Queen Elizabeth's time. Under the head of the "small white buglosse" (Anchusa Officinalis) he says, "It grows upon the dry ditch banks about Pickadilla." In the Middlesex Flora of Dyer and Trimen it is said that neither the Anchusa nor the allied plant (Echium vulgare) Viper's bugloss can be reckoned indigenous, but always of garden origin. Most botanists now make the old bugloss of Gerard to be the Borago Officinalis of Linnæus, the borage of gardens and claret-cups.

**Helvellyn.**—The story of the faithful dog which watched the dead body of his master for three months after he perished on Helvellyn has been recorded in the immortal verse of Walter Scott and of Wordsworth. For tourists who may even be ignorant of these poetic tributes, a monument has been placed on a "dark brow of the mountain" to the memory of Charles Gough, and of the dog who guarded his remains. The cost of the memorial has been borne by Miss Frances Power Cobbe and the Rev. H. D. Rawnsley, Vicar of Crosthwaite.

**Stationers' Company.**—Not many persons, not even stationers and booksellers, are aware that this company was first incorporated by Philip and Mary, in May 1556, for the express purpose of examining all books printed in England, in order to prevent the principles of the Reformation being spread, or the tenets of Popery attacked. The company has on the whole served a purpose widely different from that for which it was founded. As to Stationers' Hall, it was long a dreary-looking, unfrequented place, but has recently been used for good and useful meetings and exhibitions. The old hall was much used for entertainments, and here was performed for the first time, in 1703, Dryden's Ode, or the power of music, written for the anniversary of St. Cecilia, which was annually celebrated by the Stationers, with music, songs, and speeches.

**Café Procope.**—The year 1890 witnessed the demolition of a house famous in history, the oldest coffee-house in Paris, the Café Procope. This was once the centre of literary France, more so than the similar houses in London, Will's or Button's. Here Marmontel and Diderot and Fréron and other wits assembled, and here Voltaire often stayed from early morn till midnight, and while sipping his coffee (more cups than those of Dr. Johnson with his tea) held levées, some days with notables, and other days with the bourgeoisie. The Café was first opened in 1689 by François Procope, a Sicilian, in the Rue des Fossés St. Germain, afterwards called Rue de l'Ancienne Comédie, opposite the theatre of the Comédie Française. It was the earliest Café in France, though several coffee-houses had for some time existed in London. The Café Procope survived the Revolution, the Empire, the Restoration, the Orleans dynasty, the Second Empire, and was still frequented, by lower classes of littérateurs, in the days of the Republic. In 1791-3 the Café Procope was the head-quarters of the revolutionary writers, as the Café Foy in the Palais Royal afterwards was of the Royalists. There are now four or five thousand Cafés in Paris alone, and those throughout France are countless. The Café Procope never lost its eminence, in spite of modern luxuries and attractions. Here Gambetta met his friends, and here the leaders of the Commune settled themselves. From that time the Café was deserted by orderly people, and at last the place itself has disappeared.

**Herbert Spencer on the Penalties of Vice.**—The works of Herbert Spencer deal so largely with the merely natural and material aspects of life that it is a pleasant relief to find occasional recognition of higher laws and providential arrangements. Thus, he says, in speaking of the penalties attached to ignorance and incompetence, that it is impossible to interfere with the natural connexion between ignorance and its consequences without suspending the wholesome discipline intended; and more pointedly in his "Social Statics" he gives this utterance: "The poverty of the incapable, the distress that comes on the imprudent, the starvation of the idle, which leave so many in shallows and miseries, are the decrees of a large far-seeing benevolence."

**Unsearchable Ways of God.**—Dangerous it were for the feeble brain of man to wade far into the doings of the Most High; whom although to know be life, and joy to make mention of His Name, yet our soundest knowledge is, to know that we know Him not as indeed He is, neither can know Him; and our safest eloquence concerning Him is our silence, when we confess without confession that His glory is inexplicable, His greatness above our capacity and reach. He is above, and we upon earth; therefore it behoveth our words to be wary and few.—*Richard Hooker.*

**Cambridge from an American Point of View.**—An American traveller, who lately visited Cambridge, speaks with enthusiasm of the grand associations of the place. Here studied Sir Isaac Newton, who explored the laws of light and gravitation; and Harvey, who discovered the motive force of the heart and the circulation of the blood. Here were the poets trained: Spenser, with his wealth of fancy; Ben Jonson, the dramatist; Milton, with his lofty flight; Dryden, with his charming verse; Wordsworth, with his meditative wisdom; Coleridge, with his fine imagination; Byron, with his vigour of description; and Tennyson, with his insight and charming language. Here were Erasmus, Bentley, and Porson, men of renown. Lord Bacon began his study of philosophy here; Jeremy Taylor, known for the charm of his illustrations, his knowledge of casuistry, and force of argument, began life at Cambridge; William Pitt, the statesman, and Macaulay, orator and historian; Barrow, the divine and mathematician; Paley, with his natural theology; and Harvard, whose name reappears in a kindred institution in the United States.

**Great Bank Cheques.**—The Great Indian Peninsular Railway Company, it is reported, recently drew a cheque on the London and County Bank for £1,250,000. This might well be thought the largest ever drawn, but such is said not to be the case, as at the Clearing House cheques for equal, if not larger, sums are occasionally seen. In 1879, a cheque for over £3,000,000 was paid through the Clearing House. It was drawn on Messrs. Glyn and Co., and was paid to the Bank of England. Some of our readers familiar with banking operations may be able to give some additional facts of interest about large or special cheques, whether in commercial, or literary, or scientific connexion.

**Health and Mortality Reports for London.**—The reports of the Medical Officers of Health in various districts of the Metropolis afford interesting and useful information. The last report for the parish of Paddington is a good specimen of these statistical records, brief but clear and well arranged. Dr. James Stevenson, the Health Officer for this district, gives the following report on mortality at different ages, with comparative reference to other parts of London, and England generally. Of 482 deaths, in one quarter of the year, 104 were of infants under 1 year, 187 of children under 5 years, and 103 of persons aged 65 and upwards. The rate of infantile mortality in Paddington was 148 deaths to 1,000 registered births. In London it was 138. In the twenty-seven largest provincial towns it ranged from 111 in Birkenhead to 160 in Liverpool and in Sheffield. In fifty other large provincial towns the rate was 132 per 1,000, ranging from 55 in Darlington to 193 in Dover. The deaths of children under 5 years of age constituted 38·8 per cent. of the total deaths. 68 of these deaths were due to one or other of the seven principal zymotic diseases, viz.: Small-pox, Measles, Scarlet Fever, Diphtheria, Whooping-cough, Fever, and Diarrhœa. The deaths from Consumption and diseases of the respiratory organs were 94. The deaths from Measles were 40, and from Scarlet Fever only 1; yet the new rules as to notification of infectious diseases omit Measles from the list of those required to be reported. Whooping-cough caused 24 deaths; Diphtheria 10; while Fever (typhoid), like Scarlet Fever, had only 1 victim, and there appears no fatal case of Small-pox.

**The Congo and its Affluents.**—The River Sangha, with the district of the same name on the right bank of the Congo, has been explored by a French traveller, M. Cholet. He reports that the Sangha River is a magnificent stream, varying from three-quarters to a mile in breadth, where navigable. The district is peopled by native tribes of considerable civilisation. Bongo was once held by the French as a trading post, and will be now re-occupied. Several of the tribes have regular trade with Brazzaville, chiefly in ivory. One village, Ouosso, the capital of a wealthy chief, Mingana, is built in regular form, the houses ranged in parallelograms, about 130 feet long, and 65 broad, the carved wood of the houses being often cleverly executed, and painted with figures of birds, serpents, and other living creatures. Since the return of M. Cholet to France, where he has published an account of his travels, M. Fornedes is continuing the exploration of these regions, said to be of great commercial importance.

**The True Church.**—That church of Christ, which we so properly term His body mysticall, can be but one; neither can that one be sensibly discerned by any man, inasmuch as the parts thereof are some in Heaven already with Christ, and the rest that are on earth (albeit their natural persons be visible) we do not discern under this property, whereby they are truly and infallibly of that body. Only our minds by intellectual conceit are able to apprehend that such a real body there is, a body collective because it containeth an huge multitude, a body mysticall because the mystery of their conjunction is removed altogether from sense. Whatsoever we read in scripture concerning the endless love and the saving mercy which God showeth toward His church, the only proper subject thereof is this church. Concerning this flocke it is that our Lord and Saviour hath promised, "I give unto them eternal life, and they shall never perish, neither shall any man plucke them out of My hand." They who are of this society have such marks and notes of distinction from all others, as are not object unto our sense; only unto God who seeth their hearts and understandeth all their secret cogitations; unto Him they are clear and manifest.—*Hooker's Ecclesiastical Polity* (*Book* 3, *Ch.* 1).

**The "Angelus" Picture.**—Millet's "Angelus" is after all to come back to France. It has been sold by the American Art Association for 750,000f. to M. Chauchard, formerly managing partner in the Louvre drapery shops, who recently paid 850,000f. for Meissonier's "1814." The association paid 553,000f. for it.

**City and South London Railway.**—The inauguration of this new railway by the Prince of Wales on November 4, 1890, is a memorable incident, as being the first electric railway opened in England of public importance. The employment of electricity as the motive power has been successfully shown on several short railways, but this is a new departure, not merely on a larger scale, but from being accompanied by other innovations in railway travelling. As the Prince of Wales said in his address: "You have another advantage in having neither smoke nor steam in the tunnels, and you have ample ventilation. You have, moreover, a new system by which railway tickets are abolished, and all classes of the community will be able to travel at the same fare, and that a very small one. In that way you will save a great amount of time and trouble." The uniform and ticketless passenger traffic is managed by using turnstiles, as at the entrance to museums and exhibitions. Great praise is merited by the engineer of the line, Mr. J. H. Greathead, by Mr. Mott, Chairman of the Committee, and by all concerned in this undertaking, which will, it is hoped, sensibly relieve the pressure of traffic above ground in this part of London.

**United States Census.**—According to the Report of the eleventh decennial census, the population had reached, in 1890, 62,480,540. This does not include Indians, or white persons in the Indian territory, or the people of Alaska. A larger total was expected, particularly in New York and Brooklyn, and supplementary enumerations are there and in other places undertaken. The increase by the official returns since last census is 12,324,757, and of these 5,246,613 are classed as immigrants. The natural increase is at the rate of nearly 14 per cent., less than half of the rate in the preceding ten years. Careless enumeration, coupled with political trickery, especially in the Southern States, render the returns for 1880 very doubtful. The largest growth in 1880 was in Nebraska, which rose from under half a million to over a million. Of the States, New York leads the list, having close upon six millions. At each census there is re-apportionment of representatives to Congress according to population.

**From Russia through China to Tonquin.**—We have given occasional references to the expedition of M. Bonvalot and Prince Henry of Orleans in Central Asia. Taking as their point of departure Kuldja, the extreme point of the Russian possessions upon the frontiers of Central Asia, and crossing the watershed between Russia and China by the Tien-Tchuang, or Mountains of Heaven, they followed for more than 1,200 miles an entirely unknown route, and the result of their observations is that a fairly well inhabited and relatively cultivated country extends from the Siberian frontier and the western part of the desert of Gobi. It took M. Bonvalot and his companions, included among them being, in addition to Prince Henry, a Belgian named De Dekent, six weeks to cross this vast Asiatic desert, and after this M. Bonvalot reached the desolate region of the Lob-nor, which for a distance of nearly a thousand miles does not contain a single inhabitant. The caravan then traversed the northern extremity of the tableland of Tibet, by a pass about 16,000 ft. above the sea-level. Not far from the summit of this tableland is the holy city of Tibet, Lhassa; but although the travellers were within thirty miles of it, they did not like to enter it, for fear of exciting the susceptibilities of the Chinese, whose territory they would have to pass through. They began their descent into the basin of the Yangtze-Kiang, where they reached Batang, whence they had no difficulty in reaching the Yunnan, and so on to the Red River at Manghao, where they embarked on board a sampan for Hanoi. Near Sontay their boat met the steamer "Yunnan," upon which they took passage for Hanoi with their suite, consisting of Russian servants, Chinese, and Calmucks. M. Bonvalot speaks favourably of Tonquin, declaring that the dangers, either from enemies or from climate, have been much exaggerated, and that it promises to be the most rich and prosperous of all the colonial possessions of France.

**Judge and Jury.**—Two cases of disputed wills, decided upon the same day recently by Mr. Justice Butt, serve to illustrate the uncertainty as to the power of the verdict of a jury, at least in civil causes. In one of the cases the jury pronounced against the plaintiffs, but the judge pronounced against the will as invalid. In the second case, where an old gentleman of ninety-three left £100,000 to the wife of a shopkeeper living next door, who had for many years looked after him, relatives of the deceased alleged undue influence, and the jury found in their favour. But Mr. Justice Butt pronounced for the will, there being no legal proof of undue influence. Very vague is the line of limitation as to the office of jury and judge in our courts.

**Dr. Koch's Remedy for Consumption.**—The nature of the fluid injected into the human body as a prevention or cure of tubercular disease is as yet kept secret. Of the efficacy of the remedy in certain forms of tuberculosis there is no question. The cure of the repulsive skin disease Lupus, which is assumed to be associated with tubercle, is the most striking instance of the success of the new method. Medical reports of the influence in decided cases of pulmonary consumption are being prepared, but this is a department for the observation of which longer time is required. In a paper published by Dr. Koch the results hitherto ascertained are stated with great clearness. He gives a remarkable instance of the power of minute quantities of his remedy on the human subject, while almost inoperative on other animals, an experience common in regard to the effect of poisons. He draws the inference that great caution is necessary in attempting to draw conclusions from experimenting on living animals and not on man himself. The words of Dr. Koch's report are as follows:

"As regards the effect of the remedy on the human patient, it was clear from the beginning of the research that in one very important point the human being reacts to the remedy differently from the animal generally used in experiments—the guinea-pig—a new proof for the experimenter of the all-important law that experiment on animals is not conclusive for the human being, for the human patient proved extraordinarily more sensitive than the guinea-pig as regards the effect of the remedy. A healthy guinea-pig will bear two cubic centimetres, and even more, of the liquid injected subcutaneously, without being sensibly affected. But in the case of a full-grown, healthy man 0·25 cubic centimetre suffices to produce an intense effect. Calculated by body weight the 1,500th part of the quantity, which has no appreciable effect on the guinea-pig, acts powerfully on the human being."

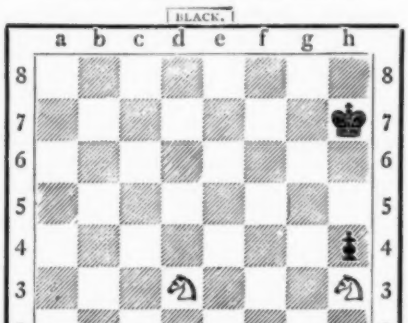
It was at the International Medical Congress at Berlin in the summer of 1890 that Dr. Koch first announced his discovery of the arrest of tuberculous disease by inoculation with the tubercle bacillus. The result of the trials on actual cases of consumption is looked for with the utmost interest. No event in medical practice is of greater importance since the introduction of vaccination by Dr. Jenner.

**Post-Office Progress.**—The Postmaster-General, the Right Hon. Cecil Raikes, M.P., in laying the memorial-stone of the new post-office building between Angel Street and St. Martin's-le-Grand, gave a most gratifying account of the progress of this great imperial institution. He said truly that whatever pertained to the General Post-Office in London was looked on with interest not in Great Britain only, but in every region of the world. Twenty years ago the new "Post-Office West" was opened, and the work has already far outgrown the accommodation. The present building would be occupied by 1,550 workers of all grades. Early in the coming century another building would be required in St. Martin's-le-Grand, although the whole business of the parcel post is transacted elsewhere. The jubilee year of the Uniform Penny Post system was now happily inaugurated by the opening of this building, a record of which—in the shape of Stamps, Reports, Newspapers, and the Jubilee Envelopes—was deposited in a jar beneath the memorial-stone. Mr. Raikes gave the following statistics of progress during the past twenty years: "In 1869 the number of postal packets, including letters and all other articles transmitted through the Post-Office, was 940,000,000, or 30 per head of the population; while in 1889 the total number of packets posted was 2,511,000,000, or 66 per head of the population. In 1871 the number of telegrams was nearly 10,000,000, while in 1889 the number had increased to 62,500,000, the telegrams in the United Kingdom in these eighteen years having increased by between 500 and 600 per cent. In 1869 the amount of money-orders despatched represented £19,500,000, while in 1889 the amount was £42,000,000. With reference to the savings bank deposits, they had risen between 1869 and 1889 from £13,500,000 to £63,000,000. The gross receipts of the Department from all sources fell short of £5,000,000 in 1869, whereas in 1889 they had exceeded £12,000,000. He did not suppose that any other institution which had ever existed could point to such a record of progress in every branch."

**Charitable Needlework Exhibition.**—A somewhat novel and very interesting exhibition was lately seen at the City and Guilds of London Institute, Prince's Gate. This was a display of work sent by the members of the London Needle work Guild. This guild was established some ten years ago by Lady Wolverton, the system being that each member should contribute annually at least two articles of clothing. Since then its numbers have rapidly increased, until at the present time they consist of several thousands. Last year 30,367 articles were contributed (amongst them being 2,043 from the Duchess of Teck, and 1,074 from Princess Victoria of Teck, who are both presidents), while this year the collection amounted to no less than 34,571 articles, being an increase of 4,204. The favourite contribution of work amongst the guild would appear to be petticoats, of which there were nearly 7,000 on view, while there are also specimens of every other imaginable kind of wearing apparel. The contributions from the Duchess of Teck were 2,660, and from Princess Victoria of Teck 1,285 articles. The immense assemblage of work is subsequently distributed amongst charities, hospitals, and poor parishes in bundles varying from 50 to 300 articles, which allows altogether for about 170 grants. The annual meeting of the committee, at which the Duchess of Teck presided, took place at 50, Prince's Gate, when the various applications for grants were considered and decided upon, the appeals being so numerous that many had to be refused. A resolution by her Royal Highness was carried, that notice should be given to each recipient of a grant requesting that the greater part of the clothing should be reserved for special necessity, such as illness, urgent cases of distress, outfits for situations, &c., and not to be given away wholesale immediately on receipt of the same, or as Christmas presents, or to sales of work.

## CHESS.

### The Longest End-game.



It is well known that the King with the two Knights alone cannot control and mate the adverse King alone, but when the latter is left with a Pawn, then the mate can sometimes be attained. This end-game, as it is technically called, has for more than a century occupied the attention of the greatest analysts, but has not yet been completely solved.

Chapais, a merchant of Paris, about the year 1780, wrote the following:—White, K—Q R 2; Kts—K 3 and K R 3; Black, K—K R 4; P—K R 5; White to play, and mate in 60 moves. This was incorrect, for a solution in 49 moves was published in 1863 by Bernhard von Guretzky-Cornitz, of Berlin. The latter plays 1, K to Kt 3, K to Kt 3. 2, K to B 4, K to B 3. 3, K to Q 5, K to B 2. 4, Kt to B 5, K to B 3. 5, Kt to Q 4 instead of Chapais's 5, Kt to Q 6, &c.

This solver, in 1864, shifted the Kings, placing the white on Q Kt 2, and the black on K Kt square, to which he gives a solution in 64 moves.

It has now been discovered that, with a different arrangement of the pieces, a still greater number of moves is required, for the five men can be placed so that the solution requires 75 moves, which is believed to be the maximum attainable, thus:—

By H. F. L. Meyer, of London.

White to play, and mate in seventy-five moves.

This diagram in the international notation is described thus:—White, K g1; O d3, h3; Black, K h7; P h4.

Readers will understand that the international notation describes the six kinds of chessmen by K, L, M, N, O, P, instead of K, Q, R, B, Kt, P, and the squares in accordance with the letters and figures on the frame of the diagram.

This end-game proves that the law of counting "fifty moves" at the end of a game must be extended to 75 moves. (Some of Blathy's problems require as many as 100 or 200 moves, but such positions do not occur in well-fought games.)

We propose to give a prize of one guinea for the first solution of this problem which reaches us; and two guineas for the shortest, if a shorter one be possible. A solver and composer who can show that seventy-five moves is not the maximum of this end-game, and will send in a position of these five pieces which would require a greater number of moves, will be entitled to three guineas. In case of a tie the prizes would be divided. Answers must be sent in by July 1 next.

PAUL TAYLOR.

# Household Queries.

**Screens.**—In reference to a recent query, a correspondent writes that he has found a capital way to make a screen is to buy a threefold clothes' horse, then strain calico over the bars, and stick the scraps upon the surface. The plain deal uprights can be painted in enamel, or gold paint, according to taste, and six brass cupboard door knobs give a smart finish to the whole, screwed into the top of the uprights; varnishing the whole affair with a hard clear varnish. The same correspondent suggests that readers should try grated cork as a decoration. He says it does capitally for picture frames, &c. Brush the surface over with some good strong glue, and then scatter the fine grated cork over it; the worker will be surprised to see how nice it looks when done well. A pepper-box does best for this, making the holes much larger with a brad-awl, and filling it with grated cork. By the way, our correspondent "Curly," who complains that her two queries about screens have had no reply, will find the answer to the only query we have received on the subject, and which we believe is hers, in the August part.

**Graining.—Rust.**—(1) *Please tell a lady how she can grain doors herself?* (2) *How to get rust out of knives?*—For the rust, rub with emery powder and oil. It is impossible to instruct in graining in reply to a query; it would occupy pages. You will find a series of practical articles in "Work" (Cassell's), Nos. 55, 58, 62, 65, 69, 72, 76, 79, 84, and still continuing. We have heard that a new invention, consisting of "transfer" graining-papers, to be transferred like various coloured transferred designs, is about being introduced. If so, when they are procurable, they will probably meet your desires.

**Black Lace.**—*"Nano" would like to know how to renovate black chantilly lace which has been used and is rather crumpled?*—If it wants washing, do this in tea, dipping it merely in and out and squeezing a few times, not rubbing it. Then sponge over with ammonia water or sal-volatile. If no cleaning is needed, merely damp it, or sponge lightly with the ammonia water. Then either spread it on a clean sheet of brown paper, pulling it out well, or, if more convenient, wind it round a clean square box; and when nearly dry, iron it smooth under an old handkerchief with rather a hot iron.

**Stained Furniture.**—*Will you kindly inform me of any way to take the white mark out of a rosewood table, caused by having had a hot glass placed on it?*—It will probably be sufficient to rub it briskly, but rather lightly, with spirit or essence of camphor on a small pad, made by stretching soft linen over a bit of cotton-wool. It is, however, safer, though a little more trouble, first to rub in linseed-oil, and then a little spirit, in the same way.

**Parkin.**—*Could you oblige me with the receipt of a kind of gingerbread called in Yorkshire "Parkin"?*—We do not suppose it is all exactly alike, but the following is good. Rub half a pound of butter and half a pound of lard into four pounds of oatmeal, or oatmeal and flour mixed if preferred. Add half a pound of brown sugar and one ounce of finely ground ginger. Mix three and a half pounds of treacle with about a cupful of new milk, and stir this into the bread and mix. Bake it in a very moderate oven; if in patty-pans about twenty minutes will bake it the proper light brown; in large dripping-tins it may take up to an hour and a half. You go by the colour.

**Cats Ill.**—(1) *Can you tell me what is the matter with my cat, and give any advice as to treatment? Her fur, except when near the fire, is constantly quite wet, but is otherwise in good condition, and does not come off at all. The skin is a dark brick-dusty red, and on her back covered with scurf. At times she quivers when breathing as if in pain. She has been fed since her illness with milk and oatmeal porridge, and before only had a small piece of lights occasionally in addition. For medicine I gave her castor-oil at first (a month ago), and since flower of sulphur mixed with butter, and put on her feet for her to lick off. But neither have done her good. Can you tell me whether the disease is catching, as I have another cat?* (2) *Can you advise me as to my cat? She has sore places on the neck, with fur off. There seem to be others coming. She is well fed and looked after.*—The first is certainly a case of eczema, and the second probably so in slightly different form, though there is a chance of mange. The eczema is not contagious, but mange is. Treatment is very long and tedious, requiring many weeks, if not months, of constant dressing and attention, with recovery rather doubtful at that, and in most cases death by chloroforming is the best and most merciful course. One difficulty is that eczema requires pretty constant gentle washing, and that is, of course, in itself very bad for a cat, especially this time of year. If treatment be adopted, oatmeal should be abandoned in the first case, being sometimes a cause of the complaint; and it is possible the second may have been too well fed. Give ten grains acetate of potash morning and evening for a fortnight, then one drop *liquor arsenicalis* twice a day for a week, then thrice a day another week; then stop it one week, and do the same again. If no improvement in six weeks, try half a grain of iodide of potassium twice a day. As washing would be almost certain death in winter, apply to the places alternately a lotion of lead and carbonate of soda. There is no doubt a little iron and cod liver oil as well would be beneficial, but one cannot be always teasing a cat to give medicine, and altogether our advice is as above.

**Trees for a City.**—*Can you favour me with any information as to the kinds or names of any trees which would grow to 30 feet high or upwards; and also shrubs—evergreen and otherwise—that will stand the smoke on the east side of a smoky town? The situation in which I wish to plant some is fully exposed to the sun and fairly open, the houses being 50 to 60 yards distant. The lower part of the ground is very moist, the higher part pretty dry.*—There is a fairly good choice. The Chili Pine (*Araucaria imbricata*) is a "specimen" tree that stands most cities; the Austrian and Swiss Pines grow well, and so does *Pinus excelsa*. The Austrian will grow in nearly every soil and locality. The Deodara Cedar is not particular; nor the English Yew; nor the well-known *Cupressa Lawsoniana*; nor the pretty Maidenhair tree. The Laurels, also, do very well, and several varieties of the Rhododendron which any gardener could specify. Holly, too, will often stand a great deal of smoke, and we have often seen it growing in most unlikely places. Many shrubs and trees will stand better if they can be syringed to remove the coating occasionally. The tree usually planted in actual streets is the plane.

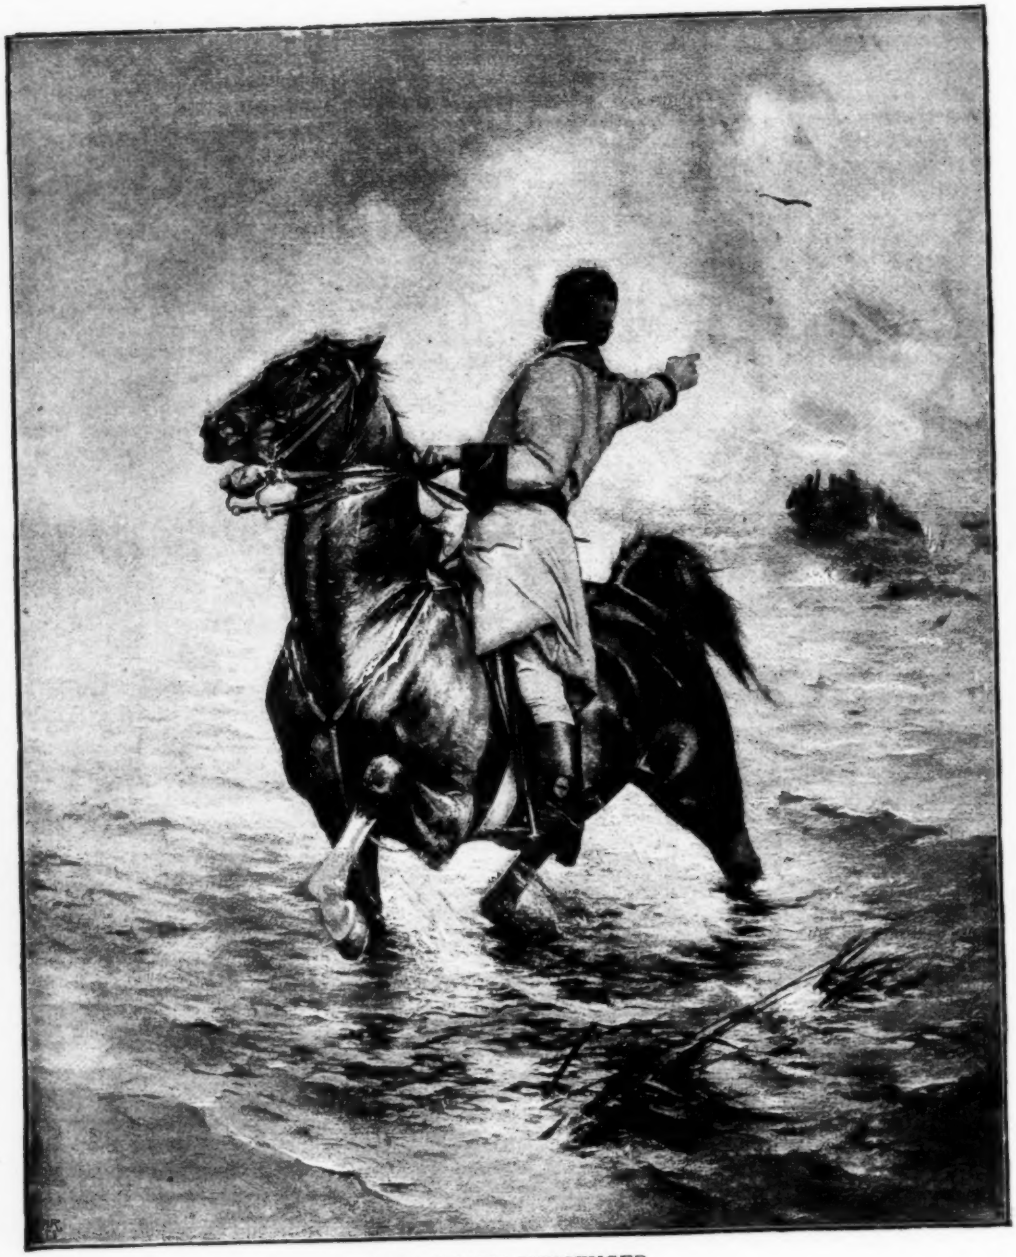
**Medlar Jelly.**—*Could you give me a receipt for making Medlar jelly; if not, could you tell me any other way of preserving or using them?*—Medlars cannot be preserved, to keep, at least with any ordinary domestic care, for the reason that their ripeness is really an incipient form of decay,

But for present use Medlar jelly can be made as follows: Select them ripe, but entirely without bruises, and simmer them some time in a pan with water half an inch above them, till the juice is expressed. Then strain through a jelly-bag—twice if not clear the first time; add a pound of loaf sugar to a pint of juice, boil rather fast, skimming it constantly, for one hour. Then let it cool a little and pour into glasses or moulds for serving.

**Furniture Deteriorated.**—*Kindly give me a hint in regard to what is best to be done in the case of mahogany furniture becoming covered with cracks and fine lines which give the otherwise smooth polish a very rough appearance. I have not had the suite very long, and would like to know the cause. It is well seasoned furniture and solidly made.*—We have consulted an experienced cabinet maker, and he agrees with us, that if the lines are actual cracks in the wood, the furniture cannot really have been well seasoned, unless you have had it in a very warm or very damp room. If you had it new, this will be the explanation. If there are no real cracks, but only tiny apparent ones the way of the grain, as in very ancient mahogany or oak, the fault may be that the French polishing was finished without sufficient "body" and has "gone in" owing to this. A French polisher or cabinet maker would tell you as to this, and, if it were the case, be able to remedy it.

**Saffron Cake.**—*I should be very pleased to get a recipe for Saffron cakes and Saffron buns. I have looked in several Cookery books, but cannot find them.*—The general method is perfectly simple, and consists in adding a spoonful or two, according to taste, of saffron-water to any kind of cake or bun at all suitable, taking care that the cake "rises" well. The water is made by infusing, say, a teaspoonful of saffron in a teacupful of boiling water and straining, or a little tincture of the drug diluted with water may be used. A very suitable cake would be made of one quartern of fine flour, one pound and a half of butter, 3 oz. carraways, six eggs well beaten, ¼ oz. mixed cloves and mace well pounded, a little cinnamon, one pound sugar, a quart of milk, a pint and a half of yeast, and the saffron, to which some add a little rosewater. Boil the milk and butter together, then skim off the butter and mix it with the flour, adding a little of the milk. Stir the yeast into the rest of the milk and strain it, and mix this with the flour also, put in the spice, rose-water, saffron-water or tincture, and sugar and eggs. Beat it all well up, and bake in a hoop or pan, well buttered, in rather a quick oven, for an hour and a half. N.B.—Saffron is a *drug*, and to be used in some cases with caution, though harmless (in moderation) as a rule.

**Grey Parrots.**—*Can you give me any advice to bring up a grey African parrot? I have bought two: the first lived about a month, then seemed to have a kind of paralysis. The next I had just a week, and that seemed to go off the same. They could not have caught cold while I had them. I shall be very much obliged if you can give me any information.*—Young grey parrots are now brought over crowded in boxes, and such are in nearly every case the subjects of blood-poisoning, and go off in from a week to six months just as you describe. Such can be bought for a pound each, whereas a really sound and acclimatised grey parrot cannot be had under £5, and is cheapest in the end. The most skilful fanciers all agree in the utter hopelessness of trying to preserve an average "young" bird. Sound adult birds are hardy enough, and may be fed mainly on oats, wheat and Indian corn, with some hemp and canary seed. Ripe fruit and a few nuts are good, but meat is bad. Unless they bathe they should have occasional shower-baths in summer. If you paid the necessary price, you have cause for complaint, and should only buy of a responsible dealer with a warranty.



**Cleaning Dress.**—*I have got a pale blue Nun's Veiling dress and have had the misfortune to get the waist marked. Can you tell me of anything to clean it without cleaning the whole dress?*—We can say little, on account of your not telling exactly what the matter is. Benzine carefully used may get out grease stains. But this material is so flimsy that it will bear little domestic rubbing, and the delicate colour is so easily injured that, if it is of any value, it will be much the safest to send it to a dyer and cleaner.

**Furnishing Drawing-room.**—*I want to furnish a drawing-room which is absolutely bare at present, even to the walls. It is twenty feet one way and about sixteen the other, including a bay window. I have about fifty pounds to spare for the purpose, and would like to know how to lay out my money to the best advantage. If you could give me a hint or two as to a general scheme of colour, whether a suite would be best or odd pieces of furniture, and how the windows should be draped, I should feel very grateful. The pictures are not to come out of the fifty pounds, but I should be glad to know what to put on the walls that will not cost a great deal.*—We answered a very similar query some months ago, which you might turn up and refer to. Suites are quite gone out, and it is more usual to have a pair only of chairs of several patterns, as a couple of hammock chairs, a couple of baskets, a couple of easy chairs, and a couple of occasional chairs of simple pattern. This is much cheaper, as well as giving variety and picturesqueness. On the other hand, a thoroughly well stuffed sofa-lounge should always be provided, and two if the room "seems" to require it. Some people, instead of pairs, have almost every chair different, and sets are chiefly bought for very large apartments, where they are scattered about amongst others. Two or three convenient small tables are also cheap, and these, too, are usually different. The most expensive items—we conclude you do not reckon a piano in the money—will be what is bought in the way of cabinets and their furnishings, the floor-coverings, the overmantel, and the sofa-lounge; and as these also chiefly give the "character" to the room, they should be considered together, as expense in one may have to involve modesty in some of the others. Odds and ends or *bric-à-brac* must also have an allowance or the room never looks furnished. You will probably find one folding screen judiciously placed makes things look more homelike, and add individuality to the room. You would find useful hints in Mrs. Panton's "From Kitchen to Garret" (Ward and Downey). Buy nothing at all gorgeous or that you grudge using constantly, for a drawing-room is no use unless it is lived in. Colour must depend somewhat upon aspect; but as a rule light and cheerful colours for floors and walls are by common consent preferable. Pale sparrow-egg blue is a favourite colour for the paint, and many people like a blue carpet. To quote Mrs. Panton, a blue carpet and yellow and white paper and ivory paint makes a charming room, but should have a yellow and white ceiling-paper also. A light blue paper with a pale yellow frieze often has a very nice effect. As a rule the paint should be of a delicate colour nearly matching one of the shades of the paper. On the other hand, there are some cold aspects with little sun where much more "comfortable" effect is got by quieter and warmer tertiary colours, such as orange yellow with sage green. As for the windows, they are draped now almost any way except the old gone-out fashion of looping back and trailing on the floor. A very good plan is to only have them reach the bottom of the window, and arrange a stuffed seat round inside the bow with a valance under. For the walls, if economy be an object, chromo-lithographs are now obtainable of quality and at a price that leaves no ground for exception, and even water-colours can be bought at very moderate prices at most artist's shops, or you can do well with engravings and etchings alone. But besides the pictures, a drawing-room looks much better with a lot of small objects hung about interspersed with them. They add to the home-feeling, though it may be carried too far.

THE KING'S MESSENGER.

# THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN AUTHOR OF "THE HOUSE OF THE WOLF," ETC.

IT WAS REAL, SUBSTANTIAL. A WAKING FIGURE.

### CHAPTER VII.—ON BOARD THE FRAMLINGHAM.

I AM told by people who have been sea-sick that the sound of the waves beating against the hull comes in time to be an intolerable torment. But bad as this may be, it can be nothing in comparison with the pains I suffered from the same cause as I recovered my senses. My brain seemed to be a cavern into which each moment, with a rhythmical regularity which added the pangs of anticipation to those of reality, the sea rushed, booming and thundering, jarring every nerve and straining the walls to bursting, and making each moment of consciousness a vivid agony. And this lasted long: how long I cannot say. But it had subsided somewhat when I first opened my eyes, and dully, not daring to move my head, looked up.

I was lying on my back. About a foot from my eyes were rough beams of wood, disclosed by a smoky yellow light, which flickered on the knot-holes and rude joists. The light swayed to and fro regularly; and this adding to my pain, I closed my eyes with a moan. Then some one came to me, and I heard voices which sounded a long way off, and promptly fell again into a deep sleep, troubled still, but less painfully, by the same

rhythmical shocks, the same dull crashings in my brain.

When I awoke again I had sense to know what caused this, and where I was—in a berth on board ship. The noise which had so troubled me was that of the waves beating against her forefoot. The beams so close to my face formed the deck, the smoky light came from the ship's lantern swinging on a hook. I tried to turn. Some one came again, and with gentle hands arranged my pillow and presently began to feed me with a spoon. When I had swallowed a few mouthfuls I gained strength to turn.

Who was this feeding me? The light was at her back and dazzled me. For a short while I took her for Petronilla, my thoughts going back at one bound to Coton, and skipping all that had happened since I left home. But as I grew stronger I grew clearer, and recalling bit by bit what had happened in the boat, I recognised Mistress Anne. I tried to murmur thanks, but she laid a cool finger on my lips and shook her head, smiling on me. "You must not talk," she murmured, "you are getting well. Now go to sleep again."

I shut my eyes at once as a child might. Another interval of unconsciousness, painless this time, followed, and again I awoke. I was lying on my side now, and without moving could see the whole

ON A SEA-CHEST AT THE FARTHER END OF THE CABIN WERE SITTING TWO PEOPLE ENGAGED IN TALK.

of the tiny cabin. The lantern still hung and smoked. But the light was steady now, and I heard no splashing without, nor the dull groaning and creaking of the timbers within. There reigned a quiet which seemed bliss to me; and I lay wrapped in it, my thoughts growing clearer and clearer each moment.

On a sea-chest at the farther end of the cabin were sitting two people engaged in talk. The one, a woman, I recognised immediately. The grey eyes full of command, the handsome features, the reddish-brown hair and gracious figure left me in no doubt even for a moment that I looked on Mistress Bertram. The sharer of her seat was a tall thin man with a thoughtful face and dreamy, rather melancholy, eyes. One of her hands rested on his knee, and her lips as she talked were close to his ear. A little aside, sitting on the lowest step of the ladder which led to the deck, her head leaning against the timbers, and a cloak about her, was Mistress Anne.

I tried to speak, and after more than one effort found my voice. "Where am I?" I whispered. My head ached sadly, and I fancied, though I was too languid to raise my hand to it, that it was bandaged. My mind was so far clear that I remembered Master Clarence and his pursuit, and the fight in the boats, and knew that we ought to be on our way to prison. Who then was the mild comely gentleman whose length of limb made the cabin seem smaller than it was? Not a gaoler, surely? Yet who else?

I could compass no more than a whisper, but faint as my voice was, they all heard me, and looked up. "Anne!" the elder lady cried sharply, seeming by her tone to direct the other to attend to me. Yet was she herself the first to rise, and come and lay her hand on my brow. "Ah! the fever is gone!" she said, speaking apparently to the gentleman, who kept his seat. "His head is quite cool. He will do well now, I am sure. Do you know me?" she continued, leaning over me.

I looked up into her eyes, and read only kindness. "Yes," I muttered. But the effort of looking was so painful that I closed my eyes again with a sigh. Nevertheless my memory of the events which had gone before my illness grew clearer, and I fumbled feebly for something which should have been at my side. "Where is —where is my sword?" I made shift to whisper.

She laughed. "Show it to him, Anne," she said; "what a never-die it is! There, Master Knight Errant, we did not forget to bring it off the field, you see!"

"But how," I murmured, "how did you escape?" I saw that there was no question of a prison. Her laugh was gay, her voice full of content.

"That is a long story," she answered kindly. "Are you well enough to hear it? You think you are? Then take some of this first. You remember that knave Philip striking you on the head with an oar as you got up? No? Well, it was a cowardly stroke, but it stood him in little stead, for we had drifted, in the excitement of the race, under the stern of the ship which you remember seeing a little before. There were English seamen on her; and when they saw three men in the act of boarding two defenceless women, they stepped in, and threatened to send Clarence and his crew to the bottom unless they sheered off."

"Ha!" I murmured. "Good!"

"And so we escaped. I prayed the captain to take us on board his ship, the Framlingham, and he did so. More, putting into Leigh on his way to the Nore, he took off my husband. There he stands, and when you are better he shall thank you."

"Nay, he will thank you now," said the tall man, rising and stepping to my berth with his head bent. He could not stand upright, so low was the deck. "But for you," he continued, his earnestness shown in his voice and eyes—the latter were almost too tender for a man's—"my wife would be now lying in prison, her life in jeopardy, and her property as good as gone. She has told me how bravely you rescued her from that cur in Cheapside, and how your presence of mind baffled the watch at the riverside. It is well, young gentleman. It is very well. But these things call for other returns than words. When it lies in her power my wife will make them, if not to-day, to-morrow, and if not to-morrow, the day after."

I was very weak, and his words brought the tears to my eyes. "She has saved my life already," I murmured.

"You foolish boy!" she cried, smiling down on me, her hand on her husband's shoulder. "You got your head broken in my defence. It was a great thing, was it not, that I did not leave you to die in the boat? There, make haste and get well. You have talked enough now. Go to sleep, or we shall have the fever back again."

"One thing first," I pleaded. "Tell me whither we are going."

"In a few hours we shall be at Dort in Holland," she answered. "But be content. We will take care of you, and send you back if you will, or you shall still come with us; as you please. Be content. Go to sleep now and get strong. Presently perhaps we shall have need of your help again."

They went and sat down then on their former seat and talked in whispers, while Mistress Anne shook up my pillows, and laid a fresh cool bandage on my head. I was too weak to speak my gratitude, but I tried to look it and so fell asleep again, her hand in mine, and the wondrous smile of those lustrous eyes the last impression of which I was conscious.

A long, dreamless sleep followed. When I awoke once more the light still hung steady, but the peacefulness of night was gone. We lay in the midst of turmoil. The scampering of feet over the deck above me, the creaking of the windlass, the bumping and clattering of barrels hoisted in or hoisted out, the harsh sound of voices raised in a foreign tongue and in queer keys, sufficed as I grew wide-awake to tell me we were in port.

But the cabin was empty, and I lay for some time gazing at its dreary interior, and wondering what was to become of me. Presently an uneasy fear crept into my mind. What if my companions had deserted me? Alone, ill, and penniless in a foreign land, what should I do? This fear in my sick state was so terrible, that I struggled to get up, and with reeling brain and nerveless hands did get out of my berth. But this feat accomplished I found that I could not stand. Everything swam before my eyes. I could not take a single step, but remained clinging helplessly to the edge of my berth, despair at my heart. I tried to call out, but my voice rose little above a whisper, and the banging and shrieking, the babel without, went on endlessly. Oh, it was cruel! cruel! They had left me!

I think my senses were leaving me too, when I felt an arm about my waist, and found Mistress Anne by my side guiding me to the chest. I sat down on it, the certainty of my helplessness and the sudden relief of her presence bringing the tears to my eyes. She fanned me, and gave me some restorative, chiding me the while for getting out of my berth.

"I thought that you had gone and left me," I muttered. I was as weak as a child.

She said cheerily: "Did you leave us when we were in trouble? Of course you did not. There, take some more of this. After all, it is well you are up, for in a short time we must move you to the other boat."

"The other boat?"

"Yes, we are at Dort, you know. And we are going by the Waal, a branch of the Rhine, to Arnheim. But the boat is here close to this one, and, with help, I think you will be able to walk to it."

"I am sure I shall if you will give me your arm," I answered gratefully.

"But you will not think again," she replied, "that we have deserted you?"

"No," I said. "I will trust you always."

I wondered why a shadow crossed her face at that. But I had no time to do more than wonder, for Master Bertram, coming down, brought our sitting to an end. She bustled about to wrap me up, and somehow, partly walking, partly carried, I was got on deck. There I sat down on a bale to recover myself, and felt at once much the better for the fresh keen air, the clear sky and wintry sunshine which welcomed me to a foreign land.

On the outer side of the vessel stretched a wide expanse of turbid water, five or six times as wide as the Thames at London, and foam-flecked here and there by the up-running tide. On the other side was a wide and spacious quay, paved neatly with round stones, and piled here and there with merchandise; but possessing, by virtue of the lines of leafless elms which bordered it, a quaint air of rusticity in the midst of bustle. The sober bearing of

the sturdy landsmen going quietly about their business accorded well with the substantial comfort of the rows of tall, steep-roofed houses I saw beyond the quay, and seemed only made more homely by the occasional swagger and uncouth cry of some half-barbarous seaman, wandering aimlessly about. Above the town rose the heavy square tower of a church, a notable landmark where all around, land and water, lay so low, where the horizon seemed so far, and the sky so wide and breezy.

"So you have made up your mind to come with us," said Master Bertram, returning to my side—he had left me to make some arrangements. "You understand that if you would prefer to go home I can secure your tendance here by good, kindly people, and provide for your passage back when you feel strong enough to cross. You understand that? And that the choice is entirely your own? So which will you do?"

I changed colour, and felt I did. I shrank, as being well and strong I should not have shrunk, from losing sight of those three faces which I had known for so short a time, yet which alone stood between myself and loneliness. "I would rather come with you," I stammered. "But I shall be a great burden to you now, I fear."

"It is not that," he replied with hearty assurance in his voice. "A week's rest and quiet will restore you to strength, and then the burden will be on the other shoulder. It is for your own sake I give you the choice, because our future is for the time uncertain. Very uncertain," he repeated, his brow clouding over, "and to become our companion may expose you to fresh dangers. We are refugees from England; that you probably guess. Our plan was to go to France, where are many of our friends, and where we could live safely until better times. You know how that plan was frustrated. Here the Spaniards are masters—Prince Philip's people; and if we are recognised, we shall be arrested and sent back to England. Still, my wife and I must make the best of it. The hue and cry will not follow us for some days, and there is still a degree of independence in the cities of Holland which may, since I have friends here, protect us for a time. Now you know something of our position, my friend. You can make your choice with your eyes open. Either way we shall not forget you."

"I will go on with you, if you please," I answered at once. "I, too, cannot go home." And as I said this, Mistress Bertram also came up, and I took her hand in mine—which looked, by the way so strangely thin I scarcely recognised it—and kissed it. "I will come with you, madam, if you will let me," I said.

"Good!" she replied, her eyes sparkling. "I said you would! I do not mind telling you now that I am glad of it. And if ever we return to England, as God grant we may and soon, you shall not regret your decision. Shall he, Richard?"

"If you say he shall not, my dear," he responded, smiling at her enthusiasm, "I think I may answer for it he will not."

I was struck then, as I had been before, by a certain air of deference which the husband assumed towards the wife. It did not surprise me, for her bearing and manner, as well as such of her actions as I had seen, stamped her as singularly self-reliant and independent for a woman: and to these qualities, as much as to the rather dreamy character of the husband, I was content to set down the peculiarity. I should add that a rare and pretty tenderness constantly displayed on her part towards him robbed it of any semblance of unseemliness.

They saw that the exertion of talking exhausted me, and so, with an encouraging nod, left me to myself. A few minutes later a couple of English sailors, belonging to the Framlingham, came up, and with gentle strength transported me, under Mistress Anne's directions, to a queer-looking wide-beamed boat which lay almost alongside. She was more like a huge Thames barge than anything else, for she drew little water, but had a great expanse of sail when all was set. There was a large deck-house, gay with paint and as clean as it could be; and in a compartment at one end of this—which seemed to be assigned to our party—I was soon comfortably settled.

Exhausted as I was by the excitement of sitting up and being moved, I knew little of what passed about me for the next two days, and remember less. I slept and ate, and sometimes awoke to wonder where I was. But the meals and the vague attempts at thought made scarcely more impression on my mind than the sleep. Yet all the while I was gaining strength rapidly, my youth and health standing me in good stead. The wound in my head, which had caused great loss of blood, healed all one way, as we say in Warwickshire; and about noon on the second day after leaving Dort I was well enough to reach the deck unassisted, and sit in the sunshine on a pile of rugs which Mistress Anne, my constant nurse, had laid for me in a corner sheltered from the wind.

Fortunately the weather was mild and warm, and the sunshine fell brightly on the wide river and the wider plain of pasture which stretched away on either side to the horizon, dotted, here and there only, by a windmill, a farmhouse, the steeple of a church, the brown sails of a barge, or at most broken by a low dike or a line of sand-dunes. All was open, free: all was largeness, space, and distance. I gazed astonished.

The husband and wife, who were pacing the deck forward, came to me. He noticed the wondering looks I cast around. "This is new to you?" he said smiling.

"Quite—quite new," I answered. "I never imagined anything so flat, and yet in its way so beautiful."

"You do not know Lincolnshire?"

"No."

"Ah, that is my native county," he answered. "It is much like this. But you are better and you can talk again. Now I and my wife have been discussing whether we shall tell you more about ourselves. And since there is no time like the present I may say that we have decided to trust you."

"All in all or not at all," Mistress Bertram added brightly.

I murmured my thanks.

"Then, first to tell you who we are. For myself

I am plain Richard Bertie of Lincolnshire, at your service. My wife is something more than appears from this, or"—with a smile—"from her present not too graceful dress. She is—"

"Stop, Richard! This is not sufficiently formal," my lady cried prettily. "I have the honour to present to you, young gentleman," she went on, laughing merrily and making a very grand curtsey before me, "Katherine, Duchess of Suffolk."

I made shift to get to my feet, and bowed respectfully, but she forced me to sit down again. "Enough of that," she said lightly, "until we go back to England. Here and for the future we are Master Bertram and his wife. And this young lady, my distant kinswoman, Anne Brandon, must pass as Mistress Anne. You wonder how we came to be straying in the streets alone and unattended when you found us?"

I did wonder, for the name of the gay and brilliant Duchess of Suffolk was well known even to me, a country lad. Her former husband, Charles Brandon, Duke of Suffolk, had been not only the one trusted and constant friend of King Henry the Eighth, but the king's brother-in-law, his first wife having been Mary, Princess of England and Queen Dowager of France. Late in his splendid and prosperous career the Duke had married Katherine, the heiress of Lord Willoughby de Eresby, and she it was who stood before me, still young and handsome. After her husband's death she had made England ring with her name, first by a love match with a Lincolnshire squire, and secondly by her fearless and outspoken defence of the reformers. I did wonder indeed how she had come to be wandering in the streets at daybreak, an object of a chance passer's chivalry and pity.

"It is simple enough," she said dryly, "I am rich, I am a Protestant, and I have an enemy. When I do not like a person I speak out. Do I not, Richard?"

"You do indeed, my dear," he answered smiling.

"And once I spoke out to Bishop Gardiner. What! Do you know Stephen Gardiner?"

For I had started at the name, after which I could scarcely have concealed my knowledge if I would. So I answered simply, "Yes, I have seen him." I was thinking how wonderful this was. These people had been utter strangers to me until a day or two before, yet now we were all looking out together from the deck of a Dutch boat on the low Dutch landscape, united by one tie, the enmity of the same man.

"He is a man to be dreaded," the Duchess continued, her eyes resting on her baby, which lay asleep on my bundle of rugs—and I guessed what fear it was had tamed her pride to flight. "His power in England is absolute. We learned that it was his purpose to arrest me, and determined to leave England. But our very household was full of spies, and though we chose a time when Clarence, our steward, whom we had long suspected of being Gardiner's chief tool, was away, Philip, his deputy, gained a clue to our design, and watched us. We gave him the slip with difficulty, leaving our luggage, but he dogged and overtook us, and the rest you know."

I bowed. As I gazed at her, my admiration I know shone in my eyes. She looked, as she stood on the deck, an exile and fugitive, so gay, so bright, so indomitable that in herself she was at once a warranty and an omen of better times. The breeze had heightened her colour, and loosened here and there a tress of her auburn hair. No wonder Master Bertie looked proudly on his Duchess.

Suddenly a thing I had clean forgotten flashed into my mind, and I thrust my hand into my pocket. The action was so abrupt that it attracted their attention, and when I pulled out a packet—two packets—there were three pairs of eyes upon me. The seal dangled from one missive. "What have you there?" the Duchess asked briskly, for she was a woman, and curious. "Do you carry the deeds of your property about with you?"

"No," I said, not unwilling to make a small sensation. "This touches your Grace."

"Hush!" she cried, raising one imperious finger. "Transgressing already? From this time forth I am Mistress Bertram, remember. But come," she went on, eyeing the packet with the seal inquisitively, "how does it touch me?"

I put it silently into her hands, and she opened it and read a few lines, her husband peeping over her shoulder. As she read her brow darkened, her eyes grew hard. Master Bertie's face changed with hers, and they both peeped suddenly at me over the edge of the parchment, suspicion and hostility in their glances. "How came you by this, young sir?" he said slowly after a long pause. "Have we escaped Peter to fall into the hands of Paul?"

"No, no!" I cried hurriedly. I saw that I had made a greater sensation than I had bargained for. I hastened to tell them how I had met with Gardiner's servant at Stony Stratford, and how I had become possessed of his credentials. They laughed, of course—indeed they laughed so loudly that the placid Dutchmen standing aft with their hands in their breeches-pockets stared open-mouthed at us, and the kindred cattle on the bank looked mildly up from the knee-deep grass.

"And what was the other packet?" the Duchess asked presently. "Is that it in your hand?"

"Yes," I answered, holding it up with some reluctance. "It seems to be a letter addressed to Mistress Clarence."

"Clarence!" she cried. "Clarence!" arresting the hand she was extending. "What! Here is our friend again then. What is in it? You have opened it?"

"No."

"You have not? Then quick, open it!" she exclaimed. "This too touches us, I will bet a penny. Let us see at once what it contains. Clarence indeed! Perhaps we may have him on the hip yet, the arch-traitor!"

But I held the pocket-book back, though my cheeks reddened and I knew I must seem foolish. They made certain that this letter was a communication to some spy, probably to Clarence himself under cover of a feminine address. Perhaps it was, but it bore a woman's name and it was sealed; and foolish though I might be, I would not betray the woman's secret.

"No, madam," I said confused, awkward, stammering, yet withholding it with a secret

obstinacy; "pardon me if I do not obey you—if I do not let this be opened. It may be what you say," I added with an effort, "but it may also contain an honest secret, and that a woman's."

"What do you say?" cried the Duchess; "here are scruples!" At that her husband smiled, and I looked in despair from him to Mistress Anne. Would she sympathise with my feelings? I found that she had turned her back on us, and was gazing over the side. "Do you really mean," continued the Duchess, tapping her foot sharply on the deck, "that you are not going to open that, you foolish boy?"

"I do—with your Grace's leave," I answered.

"Or without my Grace's leave! That is what you mean," she retorted pettishly, a red spot in each cheek. "When people will not do what I ask, it is always, Grace! Grace! Grace! But I know them now."

I dared not smile; and I would not look up, lest my heart should fail me and I should give her her way.

"You foolish boy!" she said again, and sniffed. Then with a toss of her head she went away, her husband following her obediently.

I feared that she was grievously offended, and I got up restlessly and went across the deck to the rail on which Mistress Anne was leaning, meaning to say something which should gain for me her sympathy, perhaps her advice. But the words died on my lips, for as I approached she turned her face abruptly towards me, and it was so white, so haggard, so drawn, that I uttered a cry of alarm. "You are ill!" I exclaimed. "Let me call the Duchess!"

She gripped my sleeve almost fiercely. "Hush!" she muttered. "Do nothing of the kind. I am not well. It is the water. But it will pass off if you do not notice it. I hate to be noticed," she added, with an angry shrug.

I was full of pity for her and reproached myself sorely. "What a selfish brute I have been!" I said. "You have watched by me night after night, and nursed me day after day, and I have scarcely thanked you. And now you are ill yourself. It is my fault!"

She looked at me, a wan smile on her face. "A little, perhaps," she answered faintly. "But it is chiefly the water. I shall be better presently. About that letter—did you not come to speak to me about it?"

"Never mind it now," I said anxiously. "Will you not lie down on the rugs awhile? Let me give you my place," I pleaded.

"No, no!" she cried impatiently; and seeing I vexed her by my importunity, I desisted. "The letter," she went on; "you will open it by-and-by?"

"No," I said slowly, considering, to tell the truth, the strength of my resolution, "I think I shall not."

"You will! you will!" she repeated, with a kind of scorn. "The Duchess will ask you again, and you will give it to her. Of course you will!"

Her tone was strangely querulous, and her eyes continually flashed keen biting glances at me. But I thought only that she was ill and excited, and I fancied it was best to humour her. "Well, perhaps I shall," I said soothingly. "Possibly. It is hard to refuse her anything. And yet I hope I may not. The girl—it may be a girl's secret—"

"Well?" she asked, interrupting me abruptly, her voice harsh and unmusical. "What of her?" She laid her hand on her bosom as though to still some secret pain. I looked at her, anxious and wondering, but she had again averted her face. "What of her?" she repeated.

"Only that—I would not willingly hurt her!" I blurted out.

She did not answer. She stood a moment, then to my surprise she turned away without a word, and merely commanding me by a gesture of the hand not to follow, walked slowly away. I watched her cross the deck and pass through the doorway into the deckhouse. She did not once turn her face, and my only fear was that she was ill; more seriously ill, perhaps, than she had acknowledged.

## CHAPTER VIII.—A HOUSE OF PEACE.

AS the day went on, therefore, I looked eagerly for Mistress Anne's return, but she appeared no more, though I maintained a close watch on the cabin-door. All the afternoon, too, the Duchess kept away from me, and I feared that I had seriously offended her; so that it was with no very pleasant anticipations that, going into that part of the deck-house which served us for a common room, to see if the evening meal was set, I found only the Duchess and Master Bertie prepared to sit down to it. I suppose that something of my feeling was expressed in my face, for while I was yet half-way between door and table, my lady gave way to a peal of merriment.

"Come, sit down, and do not be afraid!" she cried pleasantly, her grey eyes still full of laughter. "I vow the lad thinks I shall eat him. Nay, when all is said and done, I like you the better, Sir Knight Errant, for your scruples. I see that you are determined to act up to your name. But that reminds me," she added in a more serious vein. "We have been frank with you. You must be equally frank with us. What are we to call you, pray?"

I looked down at my plate and felt my face grow scarlet. The wound which the discovery of my father's treachery had dealt me had begun to heal. In the action, the movement, the adventure of the last fortnight, I had well-nigh lost sight of the blot on my escutcheon, of the shame which had driven me from home. But the question, "What are we to call you?" revived the smart, and revived it with an added pang. It had been very well in theory to proudly discard my old name. It was painful in practice to be unable to answer the Duchess, "I am a Cludde of Coton, nephew to Sir Anthony, formerly esquire of the body to King Henry. I am no unworthy follower and associate even for you," and to have instead to reply, "I have no name. I am nobody. I have all to make and win." Yet this was my ill-fortune.

Her woman's eye saw my trouble as I hesitated, confused and doubting what I should reply. "Come!" she said good-naturedly, trying to reas-

sure me. "You are of gentle birth. Of that we feel sure."

I shook my head. "Nay, I am of no birth, madam," I answered hurriedly. "I have no name, or at any rate no name that I can be proud of. Call me—call me, if it please you, Francis Carey."

"It is a good name," quoth Master Bertie, pausing with his knife suspended in the air. "A right good Protestant name!"

"But I have no claim to it," I rejoined, more and more hurt. "I have all to make. I am a new man. Yet do not fear!" I added quickly, as I saw what I took to be a cloud of doubt cross my lady's face. "I will follow you no less faithfully for that!"

"Well," said the Duchess, a smile again transforming her open features, "I will answer for that, Master Carey. Deeds are better than names, and as for being a new man, what with Pagets and Cavendishes and Spencers, we have nought but new men nowadays. So, cheer up!" she continued kindly. "And we will poke no questions at you, though I doubt whether you do not possess more birth and breeding than you would have us think. And if, when we return to England, as I trust we may before we are old men and women, we can advance your cause, then let me have your secret. No one can say that Katherine Willoughby ever forgot her friend."

"Or forgave her enemy over quickly!" quoth her husband naïvely.

She rapped his knuckles with the back of her knife for that; and under cover of this small diversion I had time to regain my composure. But the matter left me sore at heart, and more than a little home-sick. And I sought leave to retire early.

"You are right!" said the Duchess, rising graciously. "To-night after being out in the air you will sleep soundly, and to-morrow you will be a new man," with a faint smile. "Believe me, I am not ungrateful, Master Francis, and I will diligently seek occasion to repay both your gallant defence of the other day and your future service." She gave me her hand to kiss, and I bent over it. "Now," she continued, "do homage to my baby, and then I shall consider that you are really one of us, and pledged to our cause."

I kissed the tiny fist held out to me, a soft pink thing looking like some dainty sea-shell. Master Bertie cordially grasped my hand. And so under the oil-lamp in the neat cabin of that old Dutch boat, somewhere on the Waal between Gorcum and Nimuegen, we plighted our troth to one another, and in a sense I became one of them.

I went to my berth cheered and encouraged by their kindness. But the interview, satisfactory as it was, had set up no little excitement in my brain, and it was long before I slept. When I did I had a strange dream. I dreamed that I was sitting in the hall at Coton, and that Petronilla was standing on the daïs looking fixedly at me with gentle sorrowful eyes. I wanted to go to her, but I could not move: every dreamer knows the sensation. I tried to call to her, to ask her what was the matter, and why she so looked at me. But I could utter no sound. And still she continued to fix me with the same sad reproachful eyes, in which I read a warning yet could not ask its meaning.

I struggled so hard that at last the spell was in a degree broken. Following the direction of her eyes I looked down at myself, and saw fastened to the breast of my doublet the knot of blue velvet which she had made for my sword-hilt, and which I had ever since carried in my bosom. More, I saw with a singular feeling of anger and sorrow that a hand which came over my shoulder was tugging hard at the ribbon in the attempt to remove it.

This gave me horrible concern, yet at the moment I could not move nor do anything to prevent it. At last, making a stupendous effort, I awoke, my last experience dreaming being of the strange hand working at my breast. My first waking idea was the same, so that I threw out my arms and cried aloud and sat up. "Ugh!" I exclaimed, trembling in the intensity of my relief, as I looked about and welcomed the now familiar surroundings. "It was only a dream. It was—"

I stopped abruptly, my eyes falling on a form lurking in the doorway. I could see it only dimly by the light of a hanging lamp which smoked and burned redly overhead. Yet I could see it. It was real, substantial, a waking figure; nevertheless, a faint touch of superstitious terror still clung to me. "Speak, please!" I asked. "Who is it?"

"It is only I," answered a soft voice, well known to me—Mistress Anne's. "I came in to see how you were," she continued, advancing a little, "and whether you were sleeping. I am afraid I awoke you. But you seemed," she added, "to be having such painful dreams that perhaps it was as well I did."

I was fumbling in my breast while she spoke: and certainly, whether in my sleep I had undone the fastenings, or had loosened them intentionally before I lay down (though I could not remember doing so), my doublet and shirt were open at the breast. The velvet knot was safe, however, in that tiny inner pocket beside the letter, and I breathed again. "I am very glad you did awake me!" I replied, looking gratefully at her. "I was having a horrible dream. But how good it was of you to think of me—and when you are not well yourself too."

"Oh, I am better," she murmured, her eyes, which glistened in the light, fixed steadily on me. "Much better. Now go to sleep again, and happier dreams to you. After to-night," she added pleasantly, "I shall no longer consider you as an invalid, nor intrude upon you."

And she was gone before I could reiterate my thanks. The door fell to, and I was alone, full of kindly feelings towards her, and of thankfulness that my horrible vision had no foundation. "Thank heaven!" I murmured more than once, as I lay down; "it was only a dream."

Next day we reached Nimuegen, where we stayed a short time. Leaving that place in the afternoon, twenty-four hours journeying, partly by river, partly, if I remember rightly, by canal, brought us to the neighbourhood of Arnheim on the Rhine. It was the 1st of March, but the opening month belied its reputation. There was a brightness, a softness in

the air, and a consequent feeling as of spring which would better have befitted the middle of April. All day we remained on deck enjoying the kindliness of nature, which was especially grateful to me, in whom the sap of health was beginnning to spring again; and we were still there when one of those gorgeous sunsets which are peculiar to that country began to fling its hues across our path. We turned a jutting promontory, the boat began to fall off, and the captain came up, his errand to tell us that our journey was done.

We went eagerly forward at the news, and saw in a kind of bay, formed by a lake-like expansion of the river, a little island green and low, its banks trimly set with a single row of poplars. It was perhaps a quarter of a mile every way, and a channel one-fourth as wide separated it from the nearer shore of the river; to which, however, a long narrow bridge

WE WERE LEFT FACE TO FACE WITH TWO STRANGERS.

of planks laid on trestles gave access. On the outer side of the island, facing the river's course, stood a low white house, before which a sloping green terrace also bordered with poplars led down to a tiny pier. Behind and round the house were meadows as trim and neat as a child's toys, over which the eye roved with pleasure until it reached the landward side of the island, and there detected nestling among gardens a tiny village of half a dozen cottages. It was a scene of enchanting peace and quietude. As we slowly ploughed our way up to the landing-place, I saw the rabbits stand to gaze at us, and then with a flick of their heels dart off to their holes. I marked the cattle moving homeward in a string, and heard the wild fowl rise in creek and pool with a whir of wings. I turned with a full heart to my neighbour. "Is it not lovely?" I cried with enthusiasm. "Is it not a peaceful place—a very Garden of Eden?"

I looked to see her fall into raptures such as women are commonly more prone to than men. But all women are not the same. Mistress Anne was looking, indeed, when I turned and surprised her, at the scene which had so moved me, but the expression of her face was sad and bitter and utterly melancholy. The weariness and fatigue I had often seen lurking in her eyes had invaded all her features. She looked five years older; no longer a girl, but a grey-faced hopeless woman, whom the sight of this peaceful haven rather smote to the heart than filled with anticipations of safety and repose.

It was but for a moment I saw her so. Then she dashed her hand across her eyes—though I saw no tears in them—and with a pettish exclamation turned away. "Poor girl!" I thought. "She too is home-sick. No doubt this reminds her of some place at home, or of some person." I thought this the more likely as Master Bertie came from Lincolnshire, which he said had many of the features of this strange land. And it was conceivable enough that she should know Lincolnshire too, being related to his wife.

I soon forgot the matter in the excitement of landing. A few minutes of bustle and it was over. The boat put out again; and we four were left face to face with two strangers, an elderly man and a girl, who had come down to the pier to meet us. The former, stout, bluff, and red-faced, with a thick grey beard and a gold chain about his neck, had the air of a man of position. He greeted us warmly. His companion, who hung behind him, somewhat shyly, was as pretty a girl as one could find in a month. A second look assured me of something more—that she formed an excellent foil to the piquant brightness and keen vivacity, the dark hair and nervous features of Mistress Anne. For the Dutch girl was fair and plump and of perfect complexion. Her hair was very light, almost flaxen indeed, and her eyes were softly and limpidly blue; grave, innocent, wondering eyes they were, I remember. I guessed rightly that she was the elderly man's daughter. Later I learned that she was his only child, and that her name was Dymphna.

He was a Master Lindstrom, a merchant of standing in Arnheim. He had visited England and spoke English fairly, and being under some obligations, it appeared, to the Duchess Katherine, was to be our host.

We all walked up the little avenue together, Master Lindstrom talking as we went to husband or wife, while his daughter and Mistress Anne came next, gazing each at each in silence, as women when they first meet will gaze, taking stock, I suppose, of a rival's weapons. I walked last, wondering why they had nothing to say to one another.

As we entered the house the mystery was explained. "She speaks no English," said Mistress Anne, with a touch of scorn.

"And we no Dutch," I answered smiling. "Here in Holland I am afraid that she will have somewhat the best of us. Try her with Spanish."

"Spanish! I know none."

"Well, I do, a little."

"What, you know Spanish?" Mistress Anne's tone of surprise amounted almost to incredulity, and it flattered me, boy that I was. I dare say it would have flattered many an older head than mine. "You know Spanish? Where did you learn it?" she continued sharply.

"At home."

"At home! Where is that?" And she eyed me still more closely. "Where is your home, Master Carey? You have never told me."

But I had said already more than I intended, and I shook my head. "I mean," I explained awkwardly, "that I learned it in a home I once had. Now my home is here. At any rate I have no other."

The Dutch girl standing patiently beside us had looked first at one face and then at the other as we talked. We were all by this time in a long low parlour, warmed by a pretty closed fireplace covered with glazed tiles. On the shelves of a great armoire or dresser at one end of the room appeared a fine show of silver plate. At the other end stood a tall linen-press of walnut-wood, handsomely carved; and even the gratings of the windows and the handles of the doors were of hammered iron work. There were no rushes on the floor, which was made of small pieces of wood delicately jointed and set together and brightly polished. But everything in sight was clean and trim to a degree which would have shamed our great house at Coton, where the rushes sometimes lay for a week unchanged. With each glance round I felt a livelier satisfaction. I turned to Mistress Dymphna.

"Señorita!" I said, mustering my noblest accent. "Beso los pies de usted! Habla-usted Castillano?"

Mistress Anne stared, while the effect on the girl whom I addressed was greater than I had looked for, but certainly of a different kind. She started and drew back, an expression of offended dignity and of something like anger ruffling her placid face. Did she not understand? Yes, for after a moment's hesitation, and with a heightened colour, she answered, "Si, Señor."

Her constrained manner was not promising, but I was going on to open a conversation if I could—for it looked little grateful of us to stand there speechless and staring—when Mistress Anne interposed. "What did you say to her? What was it?" she asked eagerly.

"I asked her if she spoke Spanish. That was all," I replied, my eyes on Dymphna's face, which still betrayed trouble of some kind, "except that I paid her the usual formal compliment. But what is she saying to her father?"

It was like the Christmas game of cross questions. The girl and I had spoken in Spanish. I turned what we had said into English for Mistress Anne, and Mistress Dymphna translated it into Dutch for her father; an anxious look on her face which needed no translation.

"What is it?" asked Master Bertie, observing that something was wrong.

"It is nothing—nothing!" replied the merchant apologetically, though as he spoke his eyes dwelt on me curiously. "It is only that I did not know that you had a Spaniard in your company."

"A Spaniard?" Master Bertie answered. "We have none. This," pointing to me, "is our very good friend and faithful follower, Master Carey—an Englishman."

"To whom," added the Duchess, smiling gravely, "I am greatly indebted."

I hurriedly explained the mistake, and brought at once a smile of relief to the Mynheer's face. "Ah! pardon me, I beseech you," he said. "My daughter was in error." And he added something in Dutch which caused Mistress Dymphna to blush. "You know," he continued—"I may speak freely to you, since our enemies are in the main the same—you know that our Spanish rulers are not very popular with us, and grow less popular every day, especially with those who are of the reformed faith. We have learned some of us to speak their language, but we love them none the better for that."

"I can sympathise with you, indeed," cried the Duchess impulsively. "God grant that our country may never be in the same plight; though it looks as if this Spanish marriage were like to put us in it. It is Spain! Spain! Spain! and nothing else nowadays!"

"Nevertheless, the Emperor is a great and puissant monarch," rejoined the Arnheimer thoughtfully; "and could he rule us himself, we might do well. But his dominions are so large, he knows little of us. And worse, he is dying, or as good as dying. He can scarcely sit his horse, and rumour says that before the year is out he will resign the throne. Then we hear little good of his successor, your queen's husband, and look to hear less. I fear that there is a dark time before us, and God only knows the issue."

"And alone will rule it," Master Bertie rejoined piously.

This saying was in a way the key-note to the life we found our host living on his island estate. Peace, but peace with constant fear for an assailant, and religion for a supporter. Several times a week Master Lindstrom would go to Arnheim to superintend his business, and always after his return he would shake his head, and speak gravely, and Dymphna would lose her colour for an hour or two. Things were going badly. The reformers were being more and more hardly dealt with. The Spaniards were growing more despotic. That was his constant report. And then I would see him, as he walked with us in orchard or garden, or sat beside the stove, cast wistful glances at the comfort and plenty round him. I knew that he was asking himself how long they would last. If they escaped the clutches of a tyrannical government, would they be safe in the times that were coming from the violence of an ill-paid soldiery? The answer was doubtful, or rather it was too certain.

I sometimes wondered how he could patiently foresee such possibilities, and take no steps, whatever the risk, to prevent them. At first I thought his patience sprang from the Dutch character. Later I traced its deeper roots to a simplicity of faith and a deep religious feeling, which either did not

at that time exist in England, or existed only among people with whom I had never come into contact. Here they seemed common enough and real enough. These folks' faith sustained them. It was a part of their lives; a bulwark against the fear that otherwise would have overwhelmed them. And to an extent, too, which then surprised me, I found, as time went on, that the Duchess and Master Bertie shared this enthusiasm, although with them it took a less obtrusive form.

I was led at the time to think a good deal about this; and just a word I may say of myself, and of those days spent on the Rhine island—that whereas before I had taken but a lukewarm interest in religious questions, and while clinging instinctively to the teaching of my childhood had conformed with a light heart rather than annoy my uncle, I came to think somewhat differently now; differently and more seriously. And so I have continued to think since, though I have never become a bigot; a fact I owe, perhaps, to Mistress Dymphna, in whose tender heart there was room for charity as well as faith. For she was my teacher.

Of necessity, since no other of our party could communicate with her, I became more or less the Dutch girl's companion. I would often, of an evening, join her on a wooden bench which stood under an elm on a little spit of grass looking towards the city, and at some distance from the house. Here when the weather was warm she would watch for her father's return; and here one day while talking with her I had the opportunity of witnessing a sight unknown in England, but which year by year was to become more common in the Netherlands, more heavily fraught with menace in Netherland eyes.

We happened to be so deeply engaged in watching the upper end of the reach at the time in question, where we expected each moment to see Master Lindstrom's boat round the point, that we saw nothing of a boat coming the other way, until the flapping of its sails, as it tacked, drew our eyes towards it. Even then in the boat itself I saw nothing strange, but in its passengers I did. They were swarthy, moustachioed men, who in the hundred poses they assumed as they lounged on deck or leaned over the side never lost a peculiar air of bravado. As they drew nearer to us the sound of their loud voices, their oaths and laughter reached us plainly, and seemed to jar on the even-

THEIR BOLD FIERCE EYES RAKING THE BANKS UNCEASINGLY REACHED US AT LAST.

ing stillness. Their bold fierce eyes raking the banks unceasingly reached us at last. The girl by my side uttered a cry of alarm, and rose as if to retreat. But she sat down again, for behind us was an open stretch of turf, and to escape unseen was impossible. Already a score of eyes had marked her beauty, and as the boat drew abreast of us I had to listen to the ribald jests and laughter of those on board. My ears tingled and my cheeks burned. But I could do nothing. I could only glare at them, and grind my teeth.

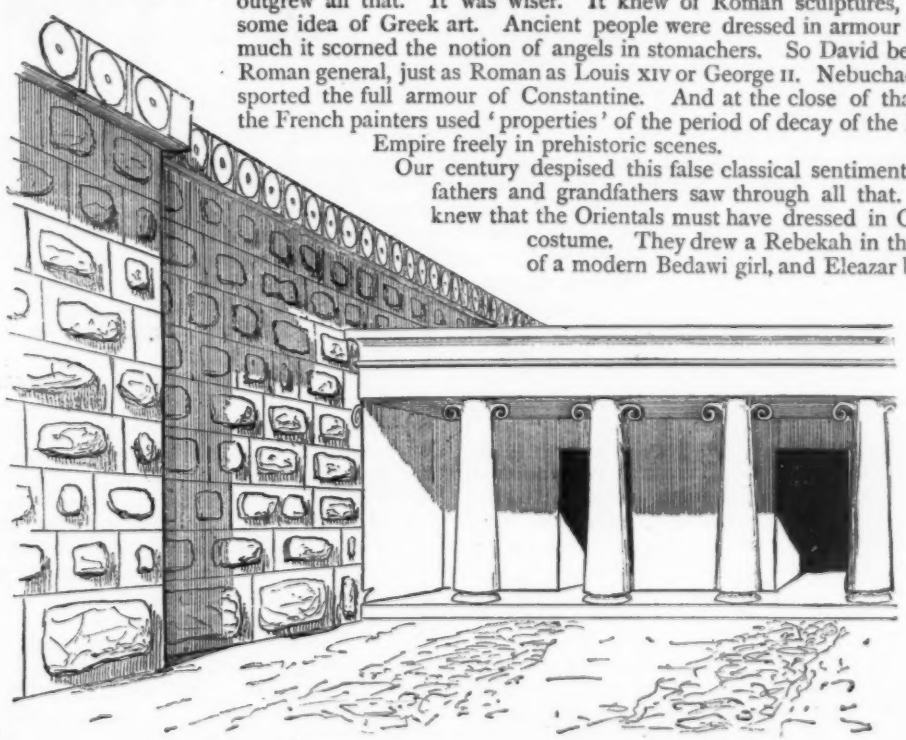
"Who are they?" I muttered. "The cowardly knaves!"

"Oh, hush! hush!" the girl pleaded. She had retreated behind me.

And indeed I need not have put my question, for though I had never seen the Spanish soldiery I had heard enough about them to recognise them

now. In the year 1555 their reputation was at its height. Their fathers had overcome the Moors after a contest of centuries, and they themselves had overrun Italy and lowered the pride of France. As a result they had many military virtues and all the military vices. Proud, bloodthirsty, and licentious everywhere, it may be imagined that in the subject Netherlands, with their pay always in arrear, they were, indeed, people to be feared. It was seldom that even their commanders dared to check their excesses.

Yet when the first flush of my anger had subsided I looked after them, odd as it may seem, with mingled feelings. With all their faults they were few against many, a conquering race in a foreign land. They could boast of blood and descent. They were proud to call themselves the soldiers and gentlemen of Europe. I was against them, yet I admired them with a boy's admiration for the strong and reckless.



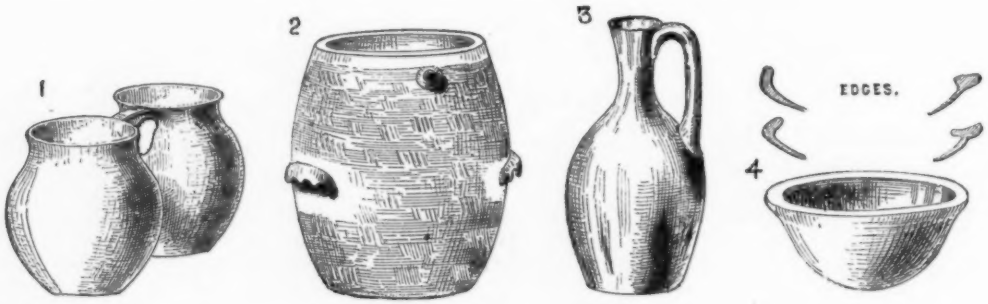
Of course I said nothing of this to my companion. Indeed, when she spoke to me I did not hear her. My thoughts had flown far from the burgher's daughter sitting by me, and were with my grandmother's people. I saw, in imagination, the uplands of Old Castile, as I had often heard them described, hot in summer and bleak in winter. I pictured the dark frowning walls of Toledo, with its hundred Moorish trophies, the castles that crowned the hills around, the grey olive groves, and the box-clad slopes. I saw Palencia, where my grandmother, Petronilla de Vargas, was born; Palencia dry and brown and sun-baked, lying squat and low on its plain, the eaves of its cathedral a man's height from the ground. All this I saw. I suppose the Spanish blood in me awoke and asserted itself at sight of those other Spaniards. And then—then I forgot it all as I heard behind me an alien voice, and I turned and found Dymphna had stolen from me and was talking to a stranger.

## ARCHITECTURE AND POTTERY IN PALESTINE.

BY WILLIAM FLINDERS PETRIE.

ABRAHAM in a full-bottomed wig, Sarah as a Dutch beldame, Bathsheba as a Batavian nymph, David as a burgomaster,—all these we have in the "old Masters"; very telling, very touching they are, if we regard them from the painter's point of view. But we laugh inevitably; to us they are incongruous; to the age that produced them they were inspiring realities. The seventeenth century outgrew all that. It was wiser. It knew of Roman sculptures, it had some idea of Greek art. Ancient people were dressed in armour: by so much it scorned the notion of angels in stomachers. So David became a Roman general, just as Roman as Louis XIV or George II. Nebuchadnezzar sported the full armour of Constantine. And at the close of that style the French painters used 'properties' of the period of decay of the Roman Empire freely in prehistoric scenes.

Our century despised this false classical sentiment. Our fathers and grandfathers saw through all that. They knew that the Orientals must have dressed in Oriental costume. They drew a Rebekah in the dress of a modern Bedawi girl, and Eleazar became



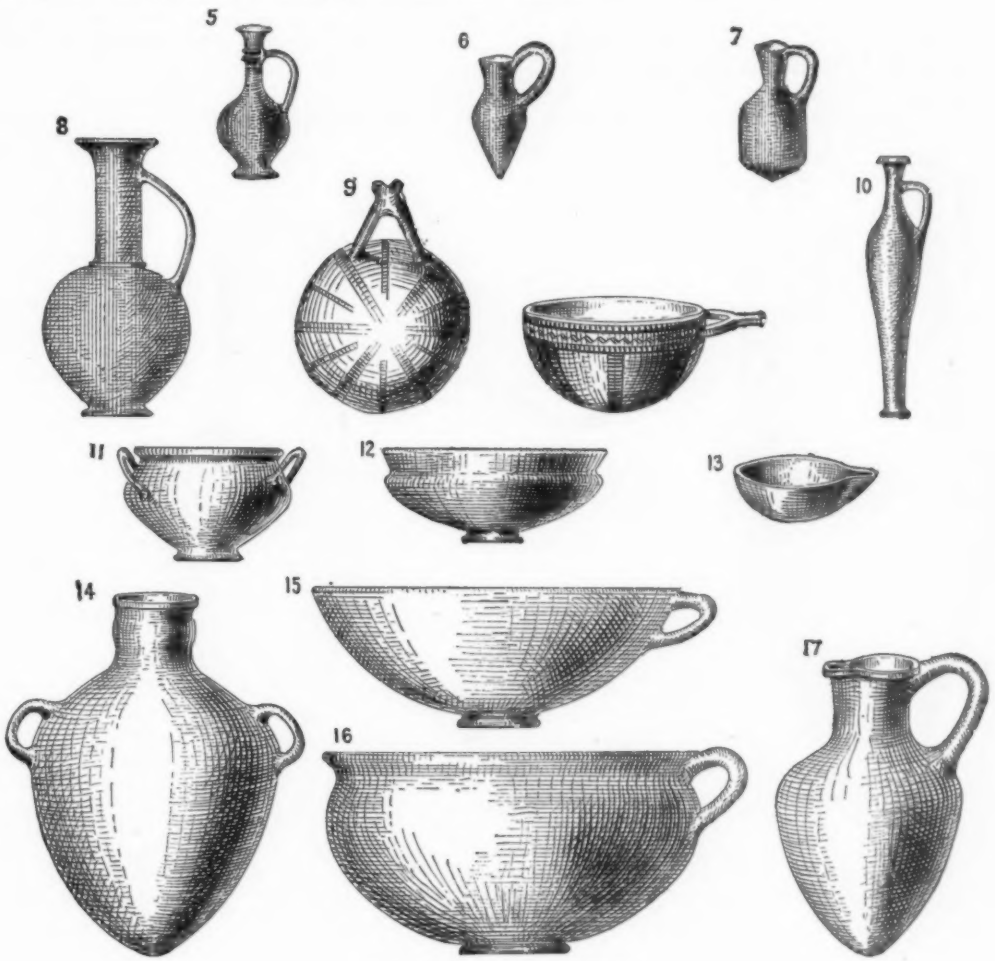
a Bedawi sketch. The matter was so beautifully and simply settled: you only needed to go to the "unchanging East," and there were costumes and customs, and pots and pans, all ready to hand. Painters revelled in it—it was art made easy, so far as the model business was concerned. And we have lately seen Greek pictures so learnedly painted: Andromache at the fountain, and all her neighbours, every one with a real Greek vase; yes, a *real* vase—no fancy imitations—actually copied "from the antique." Only the elegant and graceful brush of the P.R.A. had been busied over a whole museum full of vases of periods as diverse as might be. The result looks like the loot of a museum, everybody carrying off what suits their fancy; grand vases which never saw a fountain in their lives are here going once too often to the well. The combination is much as if a Sèvres Louis xv jar, an old English "grey-beard," a Doulton stoneware vase, and a Staffordshire washing jug were all put in one group by the village pump.

The discovery of the Assyrian sculptures was a great step for the restorer of ancient scenes. With Egypt on the one hand and Assyria on the other, it seemed as if it were only necessary to take a share of each, and temper it at discretion, in order to produce a Jewish picture. Such at least has been the source of the innumerable fancy pictures that have illustrated Old Testament history for a generation past. It is much as if a future painter of French history were to take a mixture of Italian and English dresses, ornaments, and architecture; and to suppose that the intermediate country must produce intermediate art. The Assyrian sculptures have also been heavily drawn on for a characteristic Semitic face; and the aquiline warriors of Sennacherib have lent their features to Jews and Hittites alike.

But during the last few years we have made almost a final step toward the true restoration of ancient scenes. The Egyptians had carefully distinguished the various types of the races who were their allies or their enemies, in carving the battles and triumphs upon their walls. These carvings we now have photographed; and we can safely distinguish between the various peoples of the early times about the age of the Exodus. A Hittite, a Libyan, an Amorite, or a North Syrian, are as well known to us as modern nationalities; and a painter might work on the Syrian and Hittite invasion of Judah under Ahaz with the same certainty of types as in a picture of English, Spaniards, and French in the Peninsular War.

Beside this we now have, from the excavations which I made at Lachish for the Palestine Exploration Fund, some material for the reconstruction of truly Jewish art.

In the restoration on the preceding page I have put together all the certainly ancient elements that are yet known. The wall on the left is built of blocks dressed around the edge (or *drafted*), with a central boss of rough stone left on the face. This mode of dressing is found on the walls at Lachish about the time of Ahaz, it was very common in the Herodian age and in Christian times, and it is used down to this day in Jerusalem. The projecting parapet of discs along the top is seen on the Assyrian sculpture of the siege of Lachish, and that it is not a fancy of the Assyrian artist is vouched for by its being a favourite ornament on Jewish tombs of the Herodian age. In that later development it became discs between triglyphs along an architrave, or even rosettes; but the type is proved to be ancient by the Assyrian drawing of the Jewish town. The origin of the ornament seems to be a row of shields held by a line of soldiers manning the wall, or hung over the battlements. The three hundred shields of beaten gold for the house of the forest of Lebanon, made by Solomon, were perhaps for decorating the parapet. That such a decoration might be used along an inner court, as in this restoration, seems likely, as it is found later on tomb architraves, and was not, therefore, solely an ornament of defensive architecture.



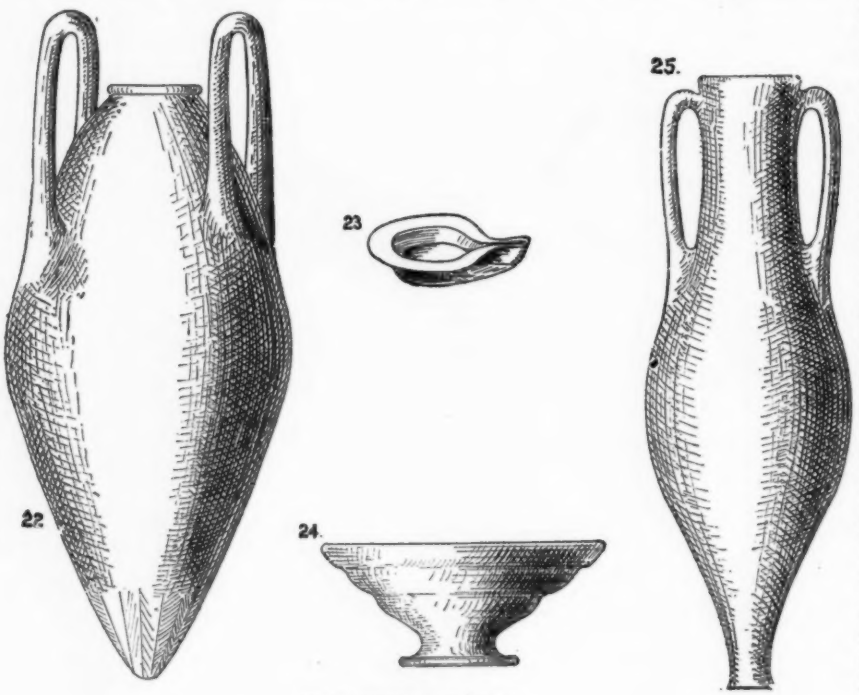
AMORITE POTTERY, 1600–1200 B.C.

For the porch form we have not an actual example as old as the kings; but as porches and colonnades are constantly mentioned in Solomon's work, as such spaces are always found before all the Herodian tombs, and as this form is equally found in Egypt and Syria, it may be fairly accepted. The architrave over it is that of the doorways about 950 B.C. at Lachish. The pillars are taken from the type of pilasters at Lachish, about 1,000 B.C. They seem to have originated in wooden shafts set upon a rounded stone base, to remove them from the damp ground. Mr. William Simpson tells me that he has seen just this arrangement in China. The shaft tapered a good deal, to judge by the pilaster. At the top volutes appear to have been attached, originally ram's horns, hung up, or nailed

to the simple columns as ornaments; these were imitated later in metal, to judge by the form, as translated into stonework on the pilaster. This stonework was formed roughly by flaking with hammers, then the surface was pounded smooth, and finally scraped down with flint scrapers. The surface of the Lachish masonry could only have been produced by chipped flint edges, and can be exactly imitated by using one of the innumerable flint flakes which are found there.

The two doorways are a peculiarly Jewish feature.

No doubt there were other architectural features, which we have no warrant for as yet in the scanty remains of early Jewish work; but we may accept what is here as being certainly proved to belong in all its details to the age of the Jewish kings. Probably a generation hence some one will be able to pick this to pieces, and to show that I have mixed together the styles of Solomon and Hezekiah; all we can say at present is that, so far, we are clear of all late or Herodian influence in what is here drawn.



PHŒNICIAN POTTERY, 1100-800 B.C.

The building at Lachish, where the pilasters are, has two doorways at the ends of each face, but no central door. Some of the Jewish tombs of later time have likewise two entrances to the porch, with a pier of rock in front of the lower tomb passage; naturally the actual entrance to a tomb itself was but one, to avoid the need of securing two passages; but the pair of entrances to the porch show that the double doorway was familiar. The doors have a slight taper upwards; perhaps more would have been permissible, as the great door of the early (perhaps Amorite) building at Ramet-el-Khulil tapered seven inches from threshold to lintel.

We will now turn to the remains of handicraft, of which all that we know at present from Palestine is the pottery. Most persons will perhaps suppose that in the "unchanging East" everything is made alike, from the time of Abraham downwards. Nothing is more deceptive than this shallow phrase; fashions change with successive races—with successive generations. In Egypt, where we can find the fullest material by which to judge, it is clear that fashion of manufactures changed quite as quickly as in mediæval Europe; and when we know enough detail of the history we can date things to a single reign. In Syria we know enough already to be able

to separate as totally distinct the Amorite, the Phœnician, the later Jewish, the early Greek, the middle Greek, the Seleucidan, the Roman, and the Arab style.

The Amorite pottery is quite different to that of any other age or country yet known. The strange, barrel-shaped pot (2), with the face smoothed by a comb, across and around; with the little spout at the top; and the ledges for handles, with wavy edges—this stands quite alone in what we know of ancient pottery. The double vase (1) was not intended to hold different liquids, as there is a hole in the middle joining the two vases. The upright jug (3) is made with a polished brown outside, as bright and smooth as a glaze. But the leading type of the pottery is the thick-brimmed bowl (4). The brims are of all kinds of fantastic

GREEK POTTERY, 700-600 B.C.

forms, of which some are shown above; and the inside is faced bright red, and polished over with burnishing. This tooling is used to give regular patterns, trellis and diagonal, upon the surface. So strongly did the Amorites impress this type on their conquerors, that degraded forms of these bowls—thin, dull red, and coarsely burnished—survived down to almost the close of the Jewish monarchy.

The Israelites had no distinctive style. They came into Palestine from the desert, where they used skins and wood; whatever they knew of pottery in Egypt was lost with the generation who died in the wilderness. They naturally followed, therefore, the Amorite forms which they found in use in Palestine, until the spread of Phœnician civilisation under David and Solomon.

The Phœnician pottery is far removed in its style from that of the Amorite. Many elegant little vases were made (5 to 8), usually of very thin pottery, hard black throughout; or of an imitation which was soft, with a black face. Some are of soft pale olive, or gosling-green ware. The bowl (9), which is well known also in Cyprus, is an imitation of a pouch of skin attached to a bent withy, which formed the brim and handle, the pattern outside showing the stitching of the flaps of skin down the outer surface. The bowls (11, 12, 15, 16) are of coarse red or brown pottery, without the beautiful burnished red facing of the Amorites'. The lamp (13) is the oldest form that is known: simply a pan with the edge pinched up into a spout. Strange to say no lamps are known in Egypt until Greek times. The large jars (14, 17) were used for water and oil. Probably Gideon's pitchers and lamps were much like these (17, 13), as we do not find lamps in the Amorite pottery, and therefore in his time this Phœnician class was most likely in use. The same word (*kad*) is used of the barrels of water poured over Elijah's sacrifice on Carmel, and also of the widow's barrel of meal; so both of these were probably of the same form (17) as Gideon's pitchers. Although this word is used for Rebekah's pitcher, yet that was probably of some different form, being so much earlier. Saul's cruse of water, the widow's cruse of oil, and Elijah's cruse of water, may have been of the form of the long-necked flasks (8 and 10); or else of the later form (19).

After the decay of the Phœnician influence, a mixed style of pottery was usual, under the later Jewish kings; it retained some of the older Amorite and Phœnician forms, but was all of coarse brown material, and clumsy form. Some of the jars (18, 21) bear letters as potters' marks. The former (21) is akin to Greek pottery found at Tahpanhes.

But while the Amorite and Phœnician influences were decaying, a new life was coming in: Greeks had pushed into Palestine by the coast trade as early as 700 B.C., to judge by the pottery we find; and the massive loop handles of great jars like 22, the long slender handles of amphoræ like 25, the sharp twisted edges of the Greek lamps (23), and the massive bowls of drab pottery (24), with a plain

spheric curve inside and ribbed outside, all show characteristic Greek work. Only fragments of these have been found at Lachish, but yet enough to identify them with the jars already known from my excavations at Naukratis and Tahpanhes in Egypt. The massive cylindrical handles and cut bottoms of the great jars (22) can be recognised by a mere chip of them.

The later styles, after the return of the Jews, are better known in general; and as I have no example from my excavations in Palestine, I will not enter on those at present.

It will be seen how characteristic the pottery is of different ages; and therefore how much we can learn historically by noting the pottery found in any place. As, moreover, pottery is the commonest relic in nearly all countries and ages, we can determine the period of a town in a few minutes by its pottery, while it would take us many months of work to ascertain it by digging for inscriptions. Pottery is the key to all historical excavations, and now that this key has been recovered from Palestine by the Lachish excavations, we can read the history of its mounds and ruins at a glance.

We have now noted some of the materials for future artists to draw on in their sketches of the scenes of the Old Testament. The architectural backgrounds may be laid out with tolerable certainty; and for a model of Gideon's pitchers, or the widow's cruse, they will not need to look very far afield. A few years more work in Palestine would probably enable us to gain much more exactitude, and a vast deal of light on history and the understanding of the narratives of the Old Testament. Let us hope that in 1900 this article will be looked on as quite out of date amid the new light then obtained.

LATER JEWISH POTTERY 800-600 B.C

## In the Firelight.

Come and dream of kings and kingdoms,
  Cooking chestnuts on the bars—
Round us the white roads are endless,
  Mournful under mournful stars.

Whisper lest we too may sadden,
  Round us herds of shadows steal—
Care not if beyond the shadows
  Flieth Fortune's furious wheel.

Kingdoms rising, kingdoms falling,
  Bowing nations, plumèd wars—
Weigh them in an hour of dreaming,
  Cooking chestnuts on the bars.

# STATESMEN OF EUROPE.

## ITALY.

### PART II.

#### GIOVANNI NICOTERA.

Giovanni Nicotera, alternately friend and colleague of Depretis and Crispi, whether in the Cabinet or on the Opposition benches, was in 1849 a lad of Calabria whom exile had launched into Piedmont. He suffered all the misery of a life of exile, and went through the education of a conspirator in the days when all patriots were forced to be conspirators. In 1858, an ardent follower of Mazzini, he joined Colonel Pisacane in the famous and unfortunate expedition of Sapri. Taken prisoner and condemned to death, his punishment was changed to lifelong detention. Liberated by Garibaldi, he took part in the Garibaldian campaign, became a deputy, a brilliant orator, and a fiery, but not always logical disputant. Towards 1874 this convinced Republican became a Monarchist—how and why does not exactly appear, but with the result that in 1876 he found himself Minister of the Interior, where he showed qualities and defects both equally great. What harmed him in public opinion was an imperious manner to which Parliament in those days was not accustomed, and which it ill supported, but which under Crispi's rule has become but too familiar. To-day Nicotera heads in the southern provinces of Italy a somewhat tame opposition against the government of Crispi. He holds, however, the same views with regard to foreign policy as his adversary. If he were to rise to power, the music would not change; it would be merely a change of the first violin. It is improbable, however, that Nicotera will be the successor of Crispi, or that Taiani will take his place—another of the companions of Depretis and a member of the last Cabinet.

Admitting for a moment that the parliamentary dictatorship of Crispi, like that of Depretis, should cease only with his death, the heir whom public opinion designates to the post is the Minister Giuseppe Zanardelli. He, too, is a lawyer, an ancient Mazzinian, an eminent Garibaldian, at one time a coadjutor of Cairoli in the Ministry of the Interior during the first years of the reign of the present king. He is a convinced Liberal, an excellent man, but difficult to discipline. As Minister of Public Works he showed a rare competence for his post, a matter which does him the more honour as his studies were those of jurisprudence and not of technical affairs. He has reformed the Italian penal codex in a modern scientific and liberal sense, making it the most advanced codex of the kind which any European nation at the present moment possesses. Although Zanardelli's intimate sympathies are not with Austria, nor with the Triple Alliance, were he to come to power in place of Crispi he would maintain the existing compacts, whose renewal in 1892 depends far more upon events than upon the men who happen to be in office.

There remains little for us to say about Guido Baccelli, Frederigo Seismit-Doda, and Alfredo Baccarini. The first, an eminent Roman doctor, has been Minister of Public Instruction, but during his term of office did not give proof of those powers which were expected from him. Seismit-Doda, an excellent patriot of Dalmatian blood, is not so well known among the great European bankers as was Magliani, his predecessor; and in the very difficult moment which Italian finance is now passing through there is required above all a man who offers to the great banking houses of Berlin, London, and Paris those moral sureties which belong to the category of imponderous but important things. As to Alfredo Baccarini, dead but a few weeks ago, his name will be associated with the vigorous opposition which he made against Depretis when the latter decided to present to Parliament his project that the railways should pass into private hands. The measure was necessary at the time because the State had need of funds. In former times, while sitting on the benches of the Left when the Right was in power, Baccarini would have hotly favoured the project. This little trait gives the measure of the logic of political parties, and especially that of the excellent man, but by no means eminent statesman, recently departed.

#### AGOSTINO MAGLIANI.

In this rapid review of the active forces of Italian statesmanship we must say a few words about Agostino Magliani—the Minister under whose direction the "corso forzoso" or forced paper currency was abolished. He contracted under sufficiently favourable conditions a European debt to favour this reform. Nevertheless, Magliani did not prove the regenerator of Italian finances, for the simple reason that they are not yet regenerated. When the grist-tax was removed, which gave to the State seventy million francs, and when public opinion insisted that the paper currency should cease and give place to bullion, Magliani was obliged to make up the deficit with taxes of divers natures, which proved no less heavy and burdensome. Thus nothing has been gained by either of these measures, Italy finds herself with a heavy debt upon her shoulders, and is taxed altogether beyond her resources. Magliani, although he was an excellent financier in the sense that he could calculate well, had the grave defect of ex-

aggerating, as Crispi, too, exaggerates, the Italian capacity for paying; and too readily consented to the demands of the Ministers of War, of Marine, and of Public Works, for ever new funds to help their various designs, believing that the Italian imposts would produce an increasingly greater sum. For a short time the income derived from the taxes did increase slightly, though not as much as was expected by the optimistic Ministerialists, until the day in which the Italian discord with France severed the close commercial communication between the two countries.

There remains always to Magliani the merit that he understood how to make the great European bankers share his own faith in an increasing Italian prosperity; and it is certain that, if Crispi had not accentuated too violently his German sympathies, which caused a constant irritation to French ears, the previsions of Magliani would in a modified sense have been verified.

His post is now occupied by Giolitti, a Piedmontese, a youngish man much thought of in his own province, little known outside it, who continues the work of his predecessor, but who has to fight with far greater difficulties than stood in Magliani's road.

Crispi's Cabinet, which, as we write, is on the eve of appealing to the country to renew its mandate,[1] has to combat a latent opposition, composed of the old members of the Right who refused to surrender their ideas in 1876, and of a handful of young men, some already members of the present Parliament, others preparing themselves for parliamentary candidature in journalism and by stumping the country.

Every government, to maintain itself in power, has directed its attention to the timorous and fluctuating mass of people who can only be held together in a compact whole by the constant waving of some scarecrow before their eyes. In this the Crispi Ministry does not differ from its predecessors. It holds at its disposal two scarecrows —a black and a white one. The timorous consciences of the great party of order are, therefore, made to understand that the old men of the Right are all more or less steeped in clericalism, and that if they were to reascend to power Italy would be once more chained to the Vatican. The same tame and unthinking consciences are made to believe that if the extreme Left which sympathises with the French Republic came into office, the most tremendous radicalism would devastate the whole of Italy, that anarchy would result, and that the land would be nothing but a slave of France. These two scarecrows, the black and the white, alternately held up, have done their office for twenty years, and are not yet worn out. It is worth while to inquire whether the two extremes are quite as black as they are painted.

### BONGHI AND BONFADINI.

Among the extreme Right may be found men like Bonghi and Bonfadini leading a band of deputies who hold that Italy must remain faithful to her diplomatic stipulations without accentuating them more than is needful, and who hold also that it is useless to irritate the Vatican more than is necessary, since, after all, its power has been entirely subdued since the conquest of Rome in 1870. Indeed, it was Bonghi who drew up the "law of the guarantees" which is the juridical platform for the relations between Italy and the Papacy. They also deem that it is imprudent for the land to throw itself into colonial enterprise, while the grapes of Puglia cannot be sold for a higher price than six francs the quintale, from lack of barrels to contain the wine, which might be made on the spot and could produce for Italy riches incalculable. They further hold it imprudent to have made so great a demonstration in Rome about the statue of Giordano Bruno, for which there was no imperative necessity. Not forgetful of 1859, they have for Napoleonic France a sympathy of grateful memories, and though they are sincere monarchists they retain a kindly feeling towards the Transalpine Republic, so long as it does not wish to carry a republican propaganda into Italy. They do not think it wise or desirable that in public education the name of God should be entirely cancelled, and that religious ideas and a liberal basis should be forbidden in the schools; and they do not expunge from the list of the country's glories such names as those of Santa Catarina da Siena and San Francesco d'Assisi.

The attitude of this party towards Government is that they desire to have a part in the management of affairs, and some security that the ideas of their party shall be in due measure considered. It is true that to a certain extent it is represented, for Boselli, Minister of Public Instruction, Brin, Minister of the Navy, and General Bertolè-Viale, Minister of War, are in sympathy with it, though the Government itself, pushed on by certain freemasonic currents, has combated its proposals, making them pass before the eyes of the public as clericals and reactionaries.

Bonghi and Bonfadini are the most eminent orators of this party, which finds special favour in Tuscany, in Venetia, and in the small towns of Lombardy and Piedmont, but less support in the great centres, which are rather dominated by the extreme faction of the rival Right. The "Fanfulla" and the "Corriere della Sera" may be considered as the authorised organs of the former faction, which is also represented in a cultured and well-written monthly review—not widely read—called the "Rassegna Nazionale." Belonging to this party are also the so-called Agrarian gentlemen, that is to say, the deputies for the Piedmontese and Lombard districts, which suffer from constantly increasing emigration, with the result that the lands remain uncultivated, and that Italy, which formerly not only produced enough rice for its needs, but was able to export it, has now to import this grain from Burmah, India, North America, and the Valley of the Euphrates. The Agrarian League, which was constituted about a year ago, has become slowly but surely a force with which the Government will have to reckon. Their spokesman is the Deputy Lucca of Vercelli, no lawyer, but a landed proprietor who speaks of what he knows.

[1] The elections have resulted in such a victory for the Liberal-monarchical party as surpassed even their most sanguine expectations.

A NIGHT SITTING IN THE ITALIAN CHAMBER OF DEPUTIES.

CAVALLOTTI.

The extreme Left, among whose rank and file were numbered in past years the present Cabinet Ministers, does not disguise its sympathies for republican France. By the mouth of the poet Cavalotti it openly accuses the Cabinet of having artificially exaggerated the character of the discord between Italy and France. The organ of this party is the "Secolo," and in a measure the "Tribuna," a much read Roman paper belonging to Prince Sciarra. The extreme Left is composed of old and young Garibaldians, and among these shines in conspicuous mode the Deputy Matteo Renato Imbriani—a frank, elegant, versatile young man, deaf to the cajolery of any special party, an ardent partisan for the liberation of the Trentino and Trieste. He is constantly calling the House to question, and always in the most correctly parliamentary form, and it would seem as if he had been put into the world on purpose to make Crispi lose his temper and self-control. He is the most vigorous force that the Opposition has at its command. He sits for the pacific district of Bari, whose cruel agrarian sufferings inspired them to send to Parliament a tribune who should plead their cause.

The popular platform held by the extreme Left is the double agitation against the clericals and against Austria. Crispi willingly lends his support to the movement against the former, and waves his black scarecrow; he does not approve the outcry against Austria, but makes use of it to strengthen the hands of his red bugbear.

Does the extreme Left desire a republic? It does not say so, but we are permitted to believe it. Is it subsidised by foreign gold, as the upholders of the red spectre pretend? We do not believe it, and in favour of our disbelief we point to the thoroughly honest and patriotic characters of the men who compose it—men mistaken no doubt, but incapable of perfidy so great as this.[1]

We have already spoken of the relations which exist between Italy and the Vatican, and there remains little more to say on this subject. We cannot however impress too strongly upon foreign readers, that it is here that must be sought the keystone of the arch of Italian politics, because it is these relations which are the principal cause of the difficulties which hamper Italian statesmen. The Italian people never were, and are not to this day, religious in the true sense of the word, and scepticism predominates. Notwithstanding this, they do not throw over the forms of the Roman Catholic Church, to which the population, especially in the country, is accustomed, and which, with its spectacular effects, and appeals to the senses, especially attracts Southern natures. This artistic tenacity in favour of their creed, side by side with religious indifference, is one great cause why the reformation of the fifteenth century never took root in Italy.

The Roman Curia is not ignorant of this, it knows perfectly well that Rome has been entirely conquered for Italy, and that no political party, of whatever colour, will ever cede in this respect. Indeed, if Rome were given back to-day to the Pope, he would not know what to do with it. Rome is no longer the city of the Popes, it has doubled its size since 1870, and it must ever be remembered that the Rome of to-day has become entirely dependent for its daily bread on the masses of people attracted within its walls by the government of Italy. The Pope knows this as well as the State: but for historic and financial reasons, and also for the sake of outsiders who contribute to Peter's Pence—which find but few subscribers in Italy—Leo XIII continues to repel all diplomatic relations with the existing Government, and every amicable step in advance which the Italian State is willing to make to him. The same policy will have to be continued by his successors, whether they believe in it or no.

That which frets the Vatican is not so much the presence of the Italian nation in Rome, as the residence in the Quirinal of the Royal Family. The struggle may be said to be between the two palaces.

It has seemed to the dweller on the other side of the Tiber, that the inhabitants of the Quirinal rob him of part of the lustre which he desires shall in Rome belong to the Papacy alone. The Vatican has not yet absolutely abandoned all its hopes on this subject, and it puts its trust, strangely enough, in the Republican cause in Italy, hoping that this party will restore it to its ancient splendour. A Prince of Savoy in Rome casts a shadow over the Vatican; a President of an Italian Republic in the same place would cause it no annoyance whatever. It is on this account that the Crown is forced repeatedly to manifest its presence in the Eternal City by ceremonious deeds and words, such as the King's now famous phrase of "intangible Rome." To this cause is also due the raising of monuments to heroes of the Italian wars of independence.

As for the probability of a future republic in Italy, for the moment such an idea may be dismissed as an idle dream. The present mode of government in Italy is as democratic as that of the United States, and it would be only a question of name to change it from a monarchy to a republic. It would be impossible for any President to be more easily approachable than is King Humbert; no President opens his ears more readily to the miseries of individuals and of the nation than does the King of Italy.

A very real plague-spot of the country, and a cause of further expense, is the enormous army of small employés that fill every post and office, doing their work indifferently, serving the public badly, miserably paid, and living upon the profits of the State. But a Republic could change little with regard to this, for every Italian aspires to hold a post under Government, and would rather earn a small income in such a position than make his way independently. Nor would a change in the form of government do anything to lighten the obligations which Italy has assumed towards the central Powers. However odious these obligations are to the majority of Italians, they nevertheless recognise

[1] Recent events prove that we have been a little too optimistic and generous in passing this judgment.

that under the existing state of things they are necessary and imperative.

It is natural that in England the questions should be asked: What has become of the old Mazzini party? Does it still exist? Has it still notable representatives? We will try to answer these questions rapidly. Mazzini was, above all things, an educator, and his influence upon Italian politics did not extend beyond the limits of an educative mission. It was Mazzini who implanted into the Italian people the double sentiment of independence and of liberty. His axiom, "God and the people," was well adapted for a period in which life was easy under all aspects. The few poor that then existed received even more help than they required from public and private charity. There was little commerce, no industry, and agriculture flourished. It may be said that in those days the struggle for life was unknown in Italy. Under such conditions the two ideas of independence and liberty easily took root and grew. From the bosom of the Mazzinian party there gradually issued a number of men, disciples of the master, who either rose to power in the Ministry or to eminent posts in the Government. Among these we may name Daniele Manin, Emilio Visconti, Venosta, Cesare Correnti, Giuseppe Garibaldi, Ninio Bixio, Giacomo Medici, and various others who were among the first not precisely to depart from the Mazzinian doctrines, but to modify the political methods employed by him.

Crispi, Depretis, and Nicotera were also old Mazzinians, but, like those above named, abandoned their faith in popular insurrections and in the fascination of the mere word Republic. The only other disciples of Mazzini of whom it is necessary to speak were Quadrio and Alberto Mario. These still preached the doctrines of their master, as did Aurelio Saffi, who was the truest follower of Mazzini; but when Saffi died the Mazzinians, though remaining nominally faithful to the republican tenets, felt themselves in a certain measure more free to act according to their ideas. The solid virtues of Saffi had kept the republican party together, but meantime new problems had arisen to be solved by thinkers. The People had obtained, thanks to the doctrine of the Mazzinians who had become Ministers, all those political liberties which they desired. The idea of God, on the other hand, has lost its value with the masses; these ask to-day nothing else but their daily bread and better economic conditions for their country. It is no longer possible to quiet the Italian lower class with promises of a change of government. The social reforms that have become necessary do not depend upon the existence at Rome rather of the president of a republic than of a sovereign. The burden of the taxation and national debt, the oppressive and almost prohibitive duties put upon industry which have closed factory after factory, the strikes, the emigration constantly increasing, in fact all the symptoms and all the effects of adversity, could not be mended by a mere change in the name of the government. It is therefore natural that the original Mazzinian party, having exhausted its password, remains nothing but an historical record. There is rising in its stead a group which desires reforms of every kind, some of them logical and just. This party is *au fond* a socialistic party, but it is divided into so many distinct sections, according to the intelligence or the sufferings of those who belong to it, that it is less likely to succeed. In Parliament it is represented by Andrea Costa, now living in Paris, who was obliged to fly from Italy because he was condemned to imprisonment for having assaulted a policeman. The Italian socialists are not absolutely republicans, or rather, they are so only in an indirect manner. They hold firmly that the monarchical system does not educate the people to practise certain simple virtues which, according to them, flourish in lands purely republican. They believe that under the monarchical *régime* it is more difficult to substitute international arbitration for war They deem that the monarchy is an obstacle to that, for them, holy cause, progressive taxation. They believe, finally, that modern monarchies demand for their basis an insolent, grasping, and pampered *bourgeoisie*. In the same manner that monarchs seek alliances and friendships with other monarchs, the Italian socialists, who may be all called Radicals, seek friendships with their brethren in other lands—especially in France; and this party is entirely Francophile. This love for France makes their enemies call them traitors to their country, but this is a calumny, for they are true patriots, though they perhaps understand patriotism in a manner diverse to that of the majority of their countrymen.

Has the extreme Left a leader? it will be asked. To all appearance their chief is Cavallotti, a poet and orator of merit, who speaks with elegance and eloquence, but who is a man in many respects resembling Emilio Castelar and Victor Hugo—that is to say, a dreamer. He lacks all the qualities essential to a statesman. If Cavallotti were called to represent the king in the post of Prime Minister he would find himself in a position not very dissimilar to that in which Crispi found himself—that is, he would have to submit to the necessities of the political State such as his predecessors had created it. Nor could he suddenly overthrow the colonial policy, since the abandonment of Massaua would not only provoke much opposition at home, but would probably bring objection from England, who counselled Italy to take possession of that port, in order that it might not become a Russian harbour. Unless the Italian policy should change, root and branch, it is not possible that Cavallotti should ever become Minister either of the Interior or of Foreign Affairs. Notwithstanding, he may have, and has, an important influence over national events. He is useful as a check and a counteracting force, and it is always possible that he might make a Ministry fall by means of legal agitation. It is certain that during 1889, when the Triple Alliance had assumed towards France a too menacing attitude, Cavallotti did real service to Italy in declaring himself openly opposed to an offensive war. In those days, by means of the "Secolo," to which he is a constant contributor, and taking as the basis for his operations

the province of Lombardy, he succeeded in imposing a little more caution upon Crispi.

In all this Cavallotti is greatly helped by Imbriani, a far more sympathetic and amiable character, also a gentleman by birth and feeling. He is not as eloquent as his comrade, but he bears better with the interruptions and tumults of the Chamber of Deputies. In Imbriani are accentuated the defects and qualities of the Tribune of the People, accepting the word in its old Latin sense. Until now this temperament has been, perhaps, a trifle exuberant, but with time it will become modified, and there are those who think that this young man has a great future before him. It is interesting to know that he is not unpopular at court, his very real virtues and his sincerity of conviction causing him to be appreciated even by those whom he would overthrow from their place.

Imbriani gave the measure of his moral courage when he attacked the Freemasons in the Chamber—a society which, in Italy, is still alive and active. The Italian Freemasons, according to the rules of the fraternity, are allied with those of the other nations, but, in contrast to their colleagues abroad, they are active in political life. During the period of the Italian *Risorgimento* the Freemasons enrolled a large number of men under their banner. Their leader at the present moment is Adriano Lemmi, a rich industrial, a former friend of the Mazzini party, but who has never taken a leading political place. In a land like Italy, where the people dearly love a flavour of mystery, it is natural that an exaggerated influence should be attributed to the Freemasons. We believe, however, that their influence is relatively slight.

Such in a bird's-eye view is the present state of Italian politics, and such are the men who lead in them. It would appear to an outsider that from this terrible chaos little good can result. We can but conclude by quoting the words of Cairoli, when he too one day felt depressed about the future of his nation:

"Parties dissolve, one assembly succeeds another, ministers pass away, but the nation, born in tears, matured in martyrdom, built up by the valour of her sons—this is an edifice that does not crumble to decay, this is a Pharos whose light does not dim."[1]

[1] The Senate House at Rome has been recently decorated with frescoes. Our engraving is from one by the painter Maccari. It represents the blind old Appius Claudius persuading the Senate to reject Pyrrhus' offer of peace: "ROME NEVER TREATS WHILE THERE IS A FOE ON ITALIAN SOIL."

## Cinderella.

POOR little Cinderella!
What did she feel, I wonder,
When that dread stroke of midnight
Snapped her bright dream asunder?

Such a dull blank "to-morrow,"
Such heavy, heavy eyes,
Such a grey world of duty,
No sunlight in the skies.

Was that brief pleasant madness
Worth all the after pain?
Back, little Cinderella,
Back to your hearth again!

My sister, Cinderella,
I, too, went to your ball;
Light, magic, silk, and splendour,
Fairy prince and all.

Glass slippers danced too lightly,
Heedless of midnight chime,
In that enchanted palace
"Once upon a time."

*Now* fairy-land has vanished,
Wishes once more are vain.
"Back, little Cinderella,
Back to your hearth again!"

Ah! happy fairy stories,
With morals quaint and old!
That was the age of magic,
This is the age of gold.

In that far-distant dreamland,
Which little children know,
Princes wooed beggar-maidens
"Years and years ago."

For those were fairy ages,
But never, *never* since
Has little Cinderella
Wedded the fairy prince.

HELEN SMETHAM.

# DE QUINCEY.

THE recent publication in fourteen volumes of a new edition of De Quincey's works under the editorship of Professor Masson, and a revised and enlarged life of the essayist by Dr. Japp, afford sufficient reason, perhaps, for touching in these pages on some of the more prominent points in the Opium Eater's career. "If this singular man's life," it has been said, "were to be written truthfully, no one would believe it, so strange the tale would seem."

From childhood to old age, indeed, De Quincey was a puzzle to all who knew him. In manners he was a courtly gentleman: in appearance, as Miss Mitford writes, he looked like a beggar. With knowledge that seemed boundless, he frequently acted like a child or a fool; always courteous in speech, he could be bitter, inconsiderate, and even malicious, in print; shy and reserved in society, he wrote of himself with a shamelessness that almost reminds us of Rousseau; regardless of money he scattered it among the most worthless of beggars, and was constantly in pecuniary difficulties. De Quincey had the warmest affection for his wife and children, but he often left them to live, nobody knew how, in solitary lodgings. Throughout the night he would ramble for miles over the country, or write for the press, and the best part of the day was given to slumber, to be followed frequently by nervous suffering, and a wretchedness "not utterable to any human ear." With a mind of amazing versatility, and many a beautiful trait of character, it is impossible to read De Quincey's life without seeing that it was, in great measure, a wreck, and that this failure was due, as in the case of Coleridge, to opium.

Thomas De Quincey, one of a family of eight children, was born in Manchester in 1785, whence shortly after the child's birth the family removed to Greenhay, then a rural suburb of the great cotton city. There his father built a house, but could have lived in it only a brief space; for after several years of travel in search of health, he died at home of consumption, when Thomas was a child of seven. The boy was one of the most sensitive of children, and extraordinarily precocious. "At thirteen," he says, "I wrote Greek with ease, and at fifteen my command of that language was so great that I not only composed Greek verses in lyric metres, but could converse in Greek fluently, and without embarrassment. . . . This boy, said one of the masters, could harangue an Athenian mob better than you or I could address an English one." It is interesting to find the boy explaining difficulties in Greek to Lady Carbery, who was at that time devoutly studying the Greek Testament in the original; and reading of this lady, we are reminded of the pious and lovely woman of the same name, who won the praises of Jeremy Taylor, and was the original of the Lady in Milton's "Comus." Whether, by marriage, she was connected with the Earl Carbery of Golden Grove, immortalised by the most eloquent of English divines, De Quincey's biographers do not tell us.

De Quincey's mother, a good woman, as clever in her son's judgment as Hannah More, and holding her religious views, removed to Bath after her husband's death, and there Thomas gained a part of his education. At sixteen the brilliantly clever youth was ready for Oxford, and wished to go there, but his guardians, much to his disgust, decided to send him for three years to Manchester in order that he might win an exhibition of £40 or £50 a year at Brasenose College. This was apparently a wise arrangement, for De Quincey's portion of the family estate was £150 a year, and on less than £200 no student could live at Oxford without privations which would make his life irksome. To De Quincey, however, the Manchester arrangement was hateful in the extreme, and after staying at the school for a year and a half, he pleaded for his immediate removal, not wholly without reason, for the daily plan of school life gave no time for physical exercise, and his health was breaking down. The request was refused, and the boy, for he was but seventeen, determined to run away. In his own inimitable style he has related the story of his adventures. His mother was at this time living at Chester, and De Quincey walked there in two days, a distance of forty miles. Great was the amazement of the household on the arrival of the truant, whom his mother was disposed to treat with severity, but, strange to say, on the intercession of an uncle, the youth was allowed to wander in North Wales on the allowance of a guinea a week. Any plan more indiscreet it would be difficult to imagine; and how was a youth, delicately nurtured, with a constitution far from vigorous, and the son, be it remembered, of a consumptive father, to live upon three shillings a day? While the summer weather lasted he had a happy time, living among the cottagers, sleeping oftentimes at night in the open air, and occasionally writing letters for rustic lovers as payment for his board.

As winter approached bivouacking became impossible, and De Quincey, eager for change and for society, "took," he writes, "a fierce resolution to sacrifice my weekly allowance, to slip my anchor, and to throw myself, in desperation, upon London."

The story of his strange career in the metropolis reads like a romance. How he tried to borrow money of the Jews, how he wandered about the streets by night and day, how he slept in the empty house of a low attorney to the comfort of a poor girl of ten years old, in whose charge it was left—this and much more about the misfortunes and privations he had brought upon himself by choice—is told with much pathos in the "Confessions." How far the tale is true, and how much of it may

be due to an imagination stimulated by opium, has been often asked, and not without cause. That De Quincey had any intention to deceive we do not for a moment believe, but he was seventeen when he passed through these London experiences, and thirty-six when he wrote the "Confessions;" is it not therefore reasonable to suppose that in this long period of time, a large portion of which had been spent under the slavery of opium, his recollections of those early days would be coloured and distorted? On returning to his friends (how this came to pass is not clearly explained) De Quincey's guardians, with a singular lack of wisdom, permitted him to go to Oxford, but refused at the same time to allow him more than £100 a year. To live on that sum was of course impossible, and De Quincey had once more recourse to the Jews. While an undergraduate of Worcester College he studied German and Hebrew, but it is a far more important fact in his history that not long after his admission he tasted opium for the first time, three years before Coleridge had fallen into the same snare, and ruined in great measure one of the finest intellects ever bestowed upon man.

With the perverseness that marked his conduct in the practical affairs of life, De Quincey left Oxford without a degree. He cherished an enthusiasm for men of genius, and unbounded was his early admiration of Coleridge and Wordsworth, in whose poetry he found, as well he might, a new world of beauty. He seems to have been in possession of money at this time, due perhaps to the Jews, and, with the generosity natural to him, upon hearing that Coleridge was in difficulties, he sent him anonymously £300. Then we read of De Quincey's conveying Mrs. Coleridge and her children to Greta Hall in Keswick, a house made fragrant by many a beautiful memory of Southey, and that stopping *en route* at Grasmere he made the acquaintance of Wordsworth. That was a memorable day to De Quincey, who describes in an often-quoted passage his first impressions of the poet and his family. A little later on he resided under Wordsworth's roof for a month or more, and, when the poet removed to a larger house, took possession of his cottage, "immortal in my remembrance," he exclaims, "as well it might be, for this cottage I retained through just seven and twenty years; this was the scene of struggles the most impetuous and bitter within my own mind, this the scene of my despondency and unhappiness, this the scene of my happiness—a happiness which justified the faith of man's *earthly* lot as upon the whole a dowry from heaven." One of the most pleasing traits in De Quincey's character was his love of children, and Wordsworth's little ones exercised a peculiar fascination. The affection he felt for them was amply returned. The little Catherine "never forgot Quincey," and when that lovely child died he was almost broken-hearted. "Oh that I might have died for her or with her," he writes, "willingly, my dear friend, I would have done this. I do not say it from any sudden burst of anguish, but as a feeling that I have ejaculated in truth and sincerity a thousand times since I heard of her death. If I had seen her in pain I could have done anything for her, and reason it was that I should, for she was a blessing to *me* and gave me many and many an hour of happy thoughts that I can never have again. You tell me to think of her with tender cheerfulness, but far from that, dear friend, my heart grows heavier and heavier every day. More and more of her words and looks and actions keep coming up before me, and there is nobody to whom I can speak about her." And afterwards he relates that he often spent the night on her grave, "not, as may readily be supposed, in any parade of grief; on the contrary, in that quiet valley of simple shepherds I was secure enough from observation until morning light began to return; but in mere intensity of sick, frantic yearning after neighbourhood to the darling of my heart."

There was not much that was congenial between Southey and De Quincey, though one link might have bound them together—an ardent love of books, and Wordsworth's friendship did not grow warmer as the years went on; but Wilson, who in his youthful days had a home in the Lake country, was a warm admirer of De Quincey, and carried him on a visit to Edinburgh, where he was regarded as "a puzzle, a paradox, a source of bewilderment."

"He became," Dr. Japp writes, "a kind of literary lion, and was persecuted with invitations to dine out, here, there, everywhere. All felt that a new influence was at work in their midst, and they enjoyed it. This new-comer, who could cap Hamilton's most recondite quotations from Plato and Plotinus, from Kant or Richter, or rectify on the spur of the moment the least lapse in a line cited from Euripides or Pindar, was worthy of study and of deference, both of which were so loyally yielded him, that De Quincey ever afterwards felt a love for Edinburgh as for a second *alma mater*."

The writer adds that he was then in that stage of opium-eating which may be regarded as a swift advance to the climax, "but, as yet at all events, his constitution and mental faculties seemed to be strengthened instead of impaired by it." Yet, according to De Quincey's own statement, he had now become a confirmed opium-eater, and Professor Masson observes that owing to this cause he regarded 1813 (the year before this visit to Edinburgh) as a fatal one in his history. "From this time the use of the drug increased and increased upon him till it reached the monstrous allowance of 320 grains of solid opium, or 8,000 drops of laudanum, per day. It may convey a more exact idea if we add that 8,000 drops would fill about seven ordinary wine-glasses."

In the prospect of a happy marriage, De Quincey resolved to fight against this fatal vice, and reduced his daily dose from 320 grains to forty. An extraordinary relief from melancholy was the result. He was happy in himself and happy in his prospects, but this reform did not last long, and in three or four years he sank into lower depths than ever. "His faculties," says his biographer, "were as though bound up in chains of frost. He shrank from mathematics and intellectual philosophy with a sense of infantile feebleness. He could not read what demanded any effort and sustained thought. . . . He seldom could prevail on himself to write a letter; an answer of a few words to any he received was all he could accomplish, and often not that until the letters had lain for weeks and even

months on his table." Horrible dreams, too, beset him. "Sometimes," says Professor Masson, "the dream-imagery was Oriental: Egypt adding her horrors to those of China and Hindostan, and all three yielding a monstrous jumble of things animate and inanimate amid which he was compelled to move and suffer, seeking refuge in vain in pagodas and their most secret rooms, or chased for ages through tropical forests, or buried in caves with mummies and sphinxes and all the abominations of the ibis and the crocodile." The terrors endured by De Quincey in the early years of the century afflicted him also many years later, when he wrote to Miss Mitford of the "undecipherable horror" that night and day broods over his nervous system, and how whatever he may be writing "becomes suddenly overspread with a dark frenzy of horror." Again and again De Quincey struggled with this enemy of his life, and again and yet again he fell, so that in 1844, when he was consuming about 5,000 drops of laudanum a day, he had been more or less under the slavery of the drug for forty years. No wonder that he called opium a curse!

It is but just to add that in the use of the drug De Quincey was able to exercise more control over himself in his later years, and also that he himself asserted that opium-eating was not due in the first instance to vicious indulgence, but was taken to obtain relief from pain caused by his early privations.

While under subjection to this tyranny at Grasmere, the necessity of winning bread for his family roused him to action, and for a time he undertook the editorship of the "Westmoreland Gazette." No man, however, was less fitted for the steady and persistent labour demanded of an editor, and he did not hold the post long.

It was as an essayist he was destined to win his fame, and at the mature age of thirty-six he became a contributor to periodical literature.

Leaving his wife and children in the cottage at Grasmere, he appears to have resided for the greater part of four years in London, living, as far as possible, in solitude, taking lonely walks at night, and suffering from the effects of opium on the liver. He was also in great straits for money and told his friend Wilson that he had not a place to hide his head in. It is pleasanter to read of De Quincey's intercourse at this period with Lamb and Hood, with Talfourd and Charles Knight. Knight, by the way, has a characteristic anecdote of the Opium Eater while a guest under his roof, during the absence of the family.

"A friend or two had met him at dinner, and I had walked part of the way home with one of them. When I returned I tapped at his chamber-door to bid him good-night; he was sitting at the open window habited as a prize-fighter when he enters the ring. 'You will take cold,' I exclaimed, 'where is your shirt?' 'I have not a shirt, my shirts are unwashed.' 'But why not tell the servant to send them to the laundress?' 'Ah! how could I presume to do that in Mrs. Knight's absence?'"

And now began De Quincey's connexion with "Blackwood," which led him to think seriously of settling in Edinburgh. Miss Wordsworth, always a wise friend, strongly advised this course, which was not ultimately adopted until 1830, when De Quincey was forty-five years of age. He was now fairly embarked on the sea of literature with every prospect, save for one drawback, of a prosperous voyage. He had a fund of the most varied knowledge always at hand, great originality of style, with a liveliness fitted for the bulk of general readers, and a frequent depth and beauty of thought which delighted readers of the highest culture.

In Edinburgh, as in London previously, his biographers have found it difficult to follow De Quincey's eccentric movements. The loss of two sons, one of whom he called the crown and glory of his life, and then of his faithful wife, left him a widower at the age of fifty-one, with six children to provide for, the eldest a girl in her teens. One of the brightest spots in a painful career is the conduct of his two daughters, who bravely undertook the management of the family affairs and settled in a cottage near Lasswade, about seven miles from Edinburgh, "where they and the four younger ones could live more quietly and economically than in the town, and to which their father could retreat when he wanted retirement."

Meanwhile he had more than one retreat in Edinburgh, and we read of his having several lodgings there, all being paid for at one time. After mentioning his extravagance in giving money lavishly to beggars, his daughter adds:

"His other extravagance grew out of the morbid value he set upon his papers, and their not being disturbed. He was in the habit of accumulating these till, according to his own description, he was 'snowed up,' which meant when matters came to such an extremity that there was not a square inch on the table to set a cup upon, that there was no possibility of making his bed for the weight of papers scattered there, that there was no chair that could be used for its legitimate purpose, and that the track from the door to the fire-place, which had always to be considered, had been blotted over even for his own careful treading; then he locked the door upon this impracticable state of things and turned elsewhere . . . At his death there were, I believe, about six places where he had these deposits, it may be imagined at what expense."

Then De Quincey had his "den" also in the country cottage, crowded, like the Edinburgh lodgings, with books and papers; and so careless were his habits that his daughters were not without fear lest the house should be set on fire. He was not a reassuring man, it is said, for a nervous person to live with. His inability to manage his affairs had forced him, even before his wife's death, to take refuge from his creditors in Holyrood, the liberties of which extended to the glorious walks in the neighbourhood of the Palace, while on Sunday, like the debtors hiding in the Mint in London, he could go whither he pleased. The "connexion with Holyrood," we are told, continued off and on for some years. Writing of De Quincey in his "Bookhunter," under the disguise of "Papaverius," Mr. Hill Burton says: "Those who knew him a little might call him a loose man in money matters; those who knew him closer laughed at the idea of coupling any notion of pecuniary or other like responsibility with his nature. You might as well attack the character of the nightingale which may have nipped up your five-pound note and torn it to shreds to serve as nest-building material."

This lack of common sense, to call it by no harsher name, brought its inevitable troubles, and it is pitiful to hear of De Quincey even in old age seeking about at times for the means of living and, like a literary neophyte, carrying his articles to the office of a newspaper or magazine.

De Quincey's eccentricities are so marked that it is difficult to think of him apart from them. To the outer world he was chiefly known as the Opium Eater, and as a brilliant essayist, but those who were near to him by blood or friendship found much to love and even to reverence. He had a sensibility that was almost morbid, and a refinement of politeness that charmed his visitors. To those beneath him in society his courtesy was extreme and sometimes a little puzzling, so elaborate was he in his explanations on requesting some small service to be done. "Ah, Mr. De Quincey," said a servant, "you are a great man, a very great man; nobody can understand you!" In society he talked with a charm that won every listener, and with the consideration natural to him was always ready to let other persons take their share in the conversation. It was only when he took pen in hand that his words ever left a sting. To accumulate books was a passion, and few men knew better how to use them. Yet he could call it, and not without reason, one of the afflictions of life, "that one must read thousands of books only to discover that one need not have read them."

Despite all he wrote of himself and all that has been written about him, we know very little of De Quincey. We can picture him as a very small, slovenly-dressed man, with gentle, winning manners, and strange and puzzling ways, as one who delighted in reverie and lived among the dreams of fancy, and who, with all his startling outside eccentricities and even the glaring candour of his opium confessions, remains an impenetrable being. This is the judgment of Dr. Masson, and probably no one living is more familiar with the works and ways of De Quincey. One of his most obvious and most beautiful characteristics was a love of children, and as his troubled life grew towards its close, his dreams seemed always to be of them. He lived until his seventy-fifth year, and died in Edinburgh in 1859, the year in which Lord Macaulay also passed away.

As an author, De Quincey is distinguished for originality of thought and style, and for the great variety of subjects upon which he has exercised his powers. He is a dreamer of poetic phantasies, and in this line of art has no rival. And there is this peculiarity with regard to De Quincey, that a taste for his essays is far from universal, even among critics and men of letters. Every one whose judgment is of value will praise, without reserve, the "Essays of Elia;" but a good many readers of culture will be moderate almost to coldness in their praise of De Quincey. They cannot contest his consummate skill as a literary artist, or the weird-like charm of his highest imaginative efforts; but at the best he wins their admiration, not their love. His elaborate and rhetorical style is sometimes supremely effective; on the other hand, his circumlocution is often infinitely tedious, and the simplest statement may be concealed in a labyrinth of words. But the words are generally musical, and allured oftentimes by the sweetness of the sound, we are willing to listen even when the meaning conveyed is trivial. The reader is told that if he dislikes the "prolonged wheeling and soaring" of De Quincey's rhetorical flights, it is because of his own incapacity to rise with him, and to such an argument the modest reader may find it difficult to reply. Yet he might answer not unreasonably that the author's flights are often without a purpose, and are not due to the loftiness of his theme. De Quincey, it has been said by Mr. Leslie Stephen, "was hardly a responsible being," and his imagination, splendid though it be in its gyrations, does not, like the imagination of great poets, feed the soul.

It is not his stately style that daunts the lover of fine literature. That is the characteristic of some of his choicest literary companions—of Hooker, Jeremy Taylor, and Sir Thomas Browne; but what he misses in De Quincey is the want of aim, the want of vivifying thought, the want of that masculine strength that gives consistency and stability to the works of our greatest authors.

Professor Masson has suggested that a young man might read the entire works of De Quincey in a month, but he adds that even for the fittest readers a month's complete and continuous course of De Quincey would be too much. This is quite true. A leisure hour with De Quincey is delightful, but he is not an author to be recommended for a prolonged course of reading. Much that he has written is scarcely worthy of preservation in book form, and all the papers that exhibit De Quincey in his finest mood can be included in one or two volumes.

The "Confessions," "The English Mail Coach," "Joan of Arc," "Levana and our Ladies of Sorrow," "Memorials of Grasmere," "Murder considered as one of the Fine Arts," the "Literary Reminiscences," and the essays on Rhetoric and Style—are the finest efforts of De Quincey's art, and these will probably satisfy most readers. Whether time will be gentle to his memory, and what rank he will ultimately take among our famous prose authors, are questions to which a critic can only reply by guesses. This at least may be said without fear of controversy: that his position in literature is unique, for he dwells in a land of dreams to which no other English author has access. His phantasies have been called by the absurd name of prose-poetry, which is, and always must be, an impossible form of literature; but in the borderland between poetry and prose De Quincey reigns supreme.

JOHN DENNIS.

# WINTER RAMBLES IN SEARCH OF MICROSCOPIC LIFE.

BY W. H. SHRUBSOLE, F.G.S.

## MARVELS IN MUD.

THERE is plenty of mud in the Medway. From the nature of the soil of the district drained by this river, it could not well be otherwise. The waste of the land is always being borne in suspension seaward, and much of it is dropped on the way.

This never-ceasing action results in a vast accumulation of earthy matters, which, sooner or later, checks the river flow in places where the current is comparatively feeble, and then deposition takes place there more rapidly, until the soft banks reach the level of ordinary tides. Large areas of swampy land have thus been formed by natural process along the course of the Medway between Chatham and Sheerness, and the southern borders of the Island of Sheppey have been greatly enlarged by the coalescence therewith—due to the silting up of the water passages—of the islets of Harty, Elmley, Russenden, Queenboro, and Sheerness, all of which probably maintained insularity in Roman times.

Man has supplemented nature by throwing up earthworks to shut out the water altogether. This work was first undertaken on a large scale in this locality in the reign of Edward III, by a Special Commission, which according to the record included such local dignitaries as the Bishop and the Prior of Rochester, Thomas de Cobham, and the Abbot of Boxley.

Long before enclosure was thought of, however, some occupants of the land had constructed raised tracks, called pede-ways (afterwards corrupted to peatways), at convenient distances apart, through the oozy marshes to the adjacent uplands, whereby to facilitate the removal of flocks and herds when high tides were expected.

After a time, as the land level gradually rose by reason of the constant settling down of the fluent slime thereon, it was seen that the water could be kept out of a limited space by connecting the river ends of two neighbouring "pedeways" by a rampart of dried mud. The idea was successfully reduced to practice, and the water excluded from areas which, from being thus shut in, were said to be "inned." A piece of land thus enclosed along the upper reaches of a river was known as a "fresh-inn," whilst a reclaimed space bordering the lower reaches was termed a "salt-inn." In time a continuous line of "wall" was formed, and the course of the river confined within narrower bounds, with the result of accelerating the speed of the current, and of deepening the channel. Now, the mud-banks that have grown up outside the artificial barriers so much that their surface, covered with saline herbage, is only submerged at spring tides, are by a strange perversion of terms called "salt-inns," or "saltings," and the true "salting" is known as a marsh.

Land of this character, not yet enclosed, extends for miles on both sides of the Medway, and constitutes an almost inexhaustible hunting-ground for the entomologist and the micro-zoologist.

It may be remarked that the enclosed land not only ceases to increase upward, but actually lowers its surface level as a consequence of shrinkage and consolidation, and from being subject to the wasting action of atmospheric forces.

As the so-called "saltings" meanwhile continue to rise, a considerable difference between the land levels in and outside the sea-wall becomes apparent.

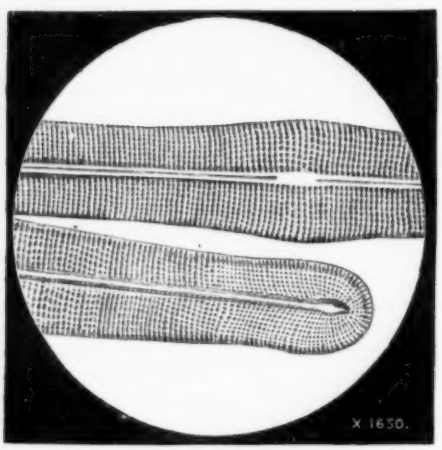
Opinions may vary as to the character of this riparian scenery. Some speak of it as being gloomy and desolate; others find animation and beauty around, and cheerfulness within, whilst plodding along the tortuous sheep tracks. Much depends on the disposition of the plodder, and the object he has in view.

During part of the year the Sea-Lavender (*Statice limonium*), Thrift (*Armeria vulgaris*), Aster (*Aster tripolium*) and other plants form successive carpets of colour which invest these spots with transient beauty; but even without such adornment the saltings have for me a special charm which long acquaintance only serves to strengthen.

They certainly have a character entirely their own. Big creeks bend about in all directions, and throughout their devious courses ramify in innumerable gullies, most of which are impassable to the pedestrian. Smaller drains and gutters meander into the gullies, and still further cut up the ground. Mazes of puzzling complexity abound, having barriers of mud or water instead of hedges. Once I spent some hours trying to reach a certain point in Stoke Marsh less than a mile distant in a direct line, and after all failed to attain the object. At first a local guide is really needed in the larger areas.

I do not recommend any one to ramble in the saltings in foggy weather, or when darkness is approaching. A few years ago I escorted a stranger to the neighbourhood thither, and when we were busy collecting specimens a light fog overspread land and water, and obscured everything beyond a quarter mile radius. This we did not mind until the sound of rifle firing was heard not far away. Although nothing was seen of the party I had a suspicion that the bullets were coming in our direction, and I now frankly confess that we hurried from our exposed position to the friendly shelter of a sea-wall. Presently the fog lifted, and on peering cautiously we saw the firing party facing us! Being unable to attract attention to our signals of distress hoisted during lulls in the firing, we were kept prisoners for nearly two hours, until

the stock of ammunition was exhausted. Afterwards, on remonstrating with one concerned, I was told that it was thought that no human beings ever went that way save the shepherd. When he had been asked the day before to keep his flock out of the line of fire, it was supposed that everything needful to ensure safety had been done. It seems as if solitude, with all its reputed charms, has at least one drawback.



The saltings most easy of access to me are those bordering the Swale, south of Queenboro. Thither have I often gladly wended my way in leisure hours at all seasons of the year; and from thence

FIG. 1.—RISSOA ULVÆ (*magnified*).

have obtained many forms of minute life, the possession of which has enabled me to gratify microscopists in various parts of the world, and has led to the enlargement of the scientific records.

On one occasion when skirting a small bay I pointed out to a companion large quantities of the shells of a small spiral gasteropod (*Rissoa ulvæ*, fig. 1) lying on the beach. By stringing these shells together children make pretty necklaces and bracelets. Then I stepped out on to the "flats," to indicate the living animals feeding on the marine plants growing thereon.

FIGS. 2 AND 2*a*.—NAVICULA JOHNSONII.

My attention was at once arrested by patches of colour varying from a rich brown almost to black. It was as if some one had been there with a large supply of treacle or tar, and had splashed it freely around. Never before had I seen anything like it, there or elsewhere; still, the colour revealed most unmistakably the diatomaceous character of the deposit. Two large jars were eagerly filled, and when the contents were afterwards examined at home, it was found that the gathering consisted of a single species of diatom, known as *Navicula Johnsonii* (figs. 2 and 2*a*). Up to that time, so far as my knowledge goes, it was quite strange to the locality, and I have not seen it since. Elated by the acquisition of this unexpected prize, I pressed on to the saltings.

On arrival there, the first thing was to get some iron spoons and other appliances from a hiding-place which serves the purpose of a tool-box. For years these useful articles have been kept there, always available to me, yet undiscovered by others.

The next thing was to examine the rills for any particular form of life, either animal or vegetable, that I might be in search of, and it sometimes happened that when looking for traces of an old friend I stumbled across something quite new.

After brushing through vigorous growths of marine plants, the Sea Orach (*Atriplex limonium*) being the most rampant, and perhaps after one or two tumbles, owing to a foot suddenly going down a hole masked by vegetation, a likely looking spot is reached.

Then it is found that the best way for one who is not so lithe as he was to effect a close scrutiny is to get into horizontal contact with Mother Earth. It matters little that the unctuous mud left by the receding tide covers everything, for it is almost as detergent as soap, and can be easily removed by the application of water, or rubbed off when dry. Well, in the bottom of the rill are seen manifold traces of life, with many silvery bubbles of oxygen enlivening and beautifying the whole. But there is some overlying water which must be removed before the coveted objects can be conveniently got at. Now the iron ladle comes into play.

X 217.

Little dams of mud are erected, and the intervening water is baled out, after which it is easy to pare off with a spoon the surface of the densely populated slime, and to transfer it with its rich burden of life to a wide-mouthed jar. When a full load has been obtained it is time to turn homeward. Accidents sometimes happen on the way, owing to the treacherous character of the ground, and disastrous smashes have taken place (fortunately but seldom) when surmounting wattle-gates or stiles. But oftener than not, home is safely reached, when the contents of the various receptacles receive due attention.

Some of the semi-fluid mud is put into spirit sample bottles, which are then placed on a window-ledge. The remainder of the gathering is transferred to soup-plates, borrowed from the kitchen. By the next morning there is a clear line of demarcation between mud and water in the bottles, and at the junction many little worms are, by the aid of a good lens, seen as in natural conditions, with their pretty tentacular crowns visible in the water, indicating the presence of the other part of their

bodies in the mud. Amongst them one of the most noticeable is *Haplobranchus æstuarinus* (fig. 3[1]), which I had the good fortune to discover a few years ago.

Those readers who may be curious as to the minute structural details of this tiny annelid can find full particulars in another work.[2] To others, perhaps, fig. 3 will convey sufficiently clear ideas of form and size. The only further information that need now be given is that the colour of its blood is not red, but green.

FIG. 3.—HAPLOBRANCHUS ÆSTUARINUS.

In the same bottle, and by the same means, will generally be seen another worm, *Hekaterobranchus Shrubsolii* (fig. 4[3]) recently introduced to scientific circles by Miss Florence Buchanan in an exhaustive paper.[4]

Beside those above mentioned, there are in the same sample of mud other worms, at present nameless, which will doubtless some day be described and labelled.

Using a lens again one sees some minute specks, surrounded by a whitish fluff, adherent to the interior of the bottle. These are animals very low down in the scale of being.

Let us examine one. In the act of detaching it from the glass with a hair pencil the fluffiness disappears. On getting it into a shallow glass cell on the microscope stage, an elegant little shell is seen, *Nonionina crassula*, var. clavata, fig. 5, somewhat nautiloid in outline (the similarity goes no farther), built up of connected chambers, each of which is occupied by a piece of living jelly, which, although it has no discoverable parts or organs, yet is able to collect and assimilate food, and to assist in locomotion and other animal functions.

After waiting a little the fluffiness noticed at first reappears, and it is seen to consist of numerous prolongations of the body substance in delicate interlacing filaments, protruded through minute pores in the shell.

These small openings originally suggested the name of the class to which the organism under inspection belongs, viz. *Foraminifera* or Hole-bearers. This particular one and many others of the same and other species were in the mud at the bottom of the bottle, and during the night they managed to raise themselves to various heights in the clear water. On turning the bottle round, the side that had been most exposed to the light is

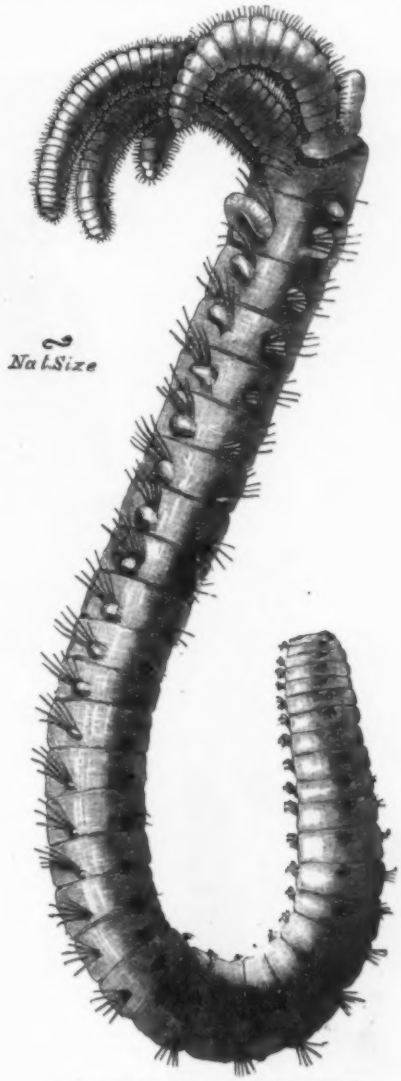


FIG. 4.—HEKATEROBRANCHUS SHRUBSOLII.

seen to be lined with what, to the uninitiated, appears as a brown stain.

Let us look at it closer. To do this easily we pour off the water, and then, using the hair pencil again, transfer a little of the stain from the bottle to a glass slip, drop a thin glass cover on, and examine it microscopically. What a beautiful sight meets the eye! A multitude of graceful, golden-tinted forms are gently gliding to and fro in the film of water between the two glasses.

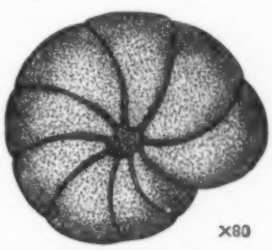

FIG. 5.—NONIONINA CRASSULA.

# THE INCOMPLETE ADVENTURER.

BY TIGHE HOPKINS, AUTHOR OF "THE NUGENTS OF CARRICONNA," ETC.

GRACE HERSELF APPEARED IN THE PORCH.

## CHAPTER XII.—DINNER, AND SOMETHING MORE.

GUY paid not the slightest heed to Phipson's raillery. He did not bestow a thought upon the possible fate of Phipson's aunt, whose existence he regarded as barely worthy of credence. The sole concern in his mind was the cousinship of Phipson and Trona, and as it seemed to him eminently unreasonable that those two should be in any way related to each other, he was not certain that it would be proper in him to allow it.

But he recollected that it was Trona who had spoken to their relationship, and the word of Trona compelled him to acquiescence.

He even softened a little towards Phipson: as Trona's cousin Phipson was entitled to consideration. He congratulated him on being the cousin of Trona. He could not justly do less than that, though the merit was none of Phipson's.

"But you were in the City together to-day," said Guy.

"And you must thank me for braving the fog," returned Trona. "It was a little mission of my own on account of—well, you know what."

"Then it was because you were there too that I succeeded in spite of—in spite of everything," said Guy.

"Then you *did* succeed?' exclaimed Trona.

Guy told them of Colonel Capperley, and the expert who was to examine and report upon M. Rohand.

"That's a grand man, Capperley," said Phipson. "I'm hearing of him this great while past. He'll have the rights of you, if there's one in London can do it. What's the name of his expert?"

"That I did not inquire," said Guy.

"No matter," answered Phipson. "'Twas just as well. Capperley's a great man for experts. He has the whole of them at his call. They're all qualified, too; so you can't go wrong with them."

"*They* cannot go wrong with the powder, at all events," answered Guy. "Any expert stands or falls by his report on that. But tell me, Miss Gault, was your errand successful?"

"We did not complete it. Fate, in the shape of the fog, prevented us from crossing the path of Colonel Capperley. We lost our way."

"Then Colonel Capperley is certainly the man," said Guy.

"Go bail on Capperley!" said Phipson.

Trona poured tea for Guy, and seemed to show by her liberal serving of the cream that she had decided to condone his omission of the pre-

liminaries. Indeed, she was as gay and frank of manner with him as before. She was amiability itself to Phipson, who passed Guy the muffins with the careless confidence of old friendship.

Guy took a muffin from the plate, but on his side the *entente cordiale* with Phipson was not yet complete. He felt Phipson's presence inharmonious. Phipson was not a believer in the scheme; he was, therefore, in Guy's opinion, an opponent of it—standing to the scheme in the relation of the east wind to an April orchard.

Floating in his world of phantasms, Guy had suddenly fetched up another cause of hostility to Phipson. Phipson might be in love with Trona. In fact, since he was her cousin, and invited to dinner, he must be in love with her. This question must be disposed of at once.

Tea over, he took Phipson aside, pinned him in an alley of the garden, and said:

"Are you quite certain, Phipson, that you know what it is to be in love?"

"And who's telling you I'm in love?" chirruped the little surgeon.

"I insist upon your being absolutely candid with me," said Guy. "Love is the privilege of none but the rarest souls. At a certain time of life every one professes it; but I assure you, Phipson, that very few are capable of it. Are you amongst these rare souls? I am one of them myself, but that is not to the purpose. Rochefoucauld has said that few men would ever have been in love if they had never heard of love. Tell me, Phipson, who has persuaded you that you are in love."

"Why, man! I never said I was in love at all."

"That is enough. I see that you are not capable of it. Persons of your age (Phipson was Guy's junior by a year) are sometimes consumed by a second-hand flame which they have lighted up at the works of novelists or poets. You must never think of your cousin, Miss Gault. I may settle you in marriage myself, perhaps, one day."

Guy habitually put on this absurd manner with Phipson, who was maliciously pleased to encourage him in it.

"Is it Trona?" said he. "And do you think now that men of our sort would pretend to Trona? I hope we're a great deal cuter than that, the pair of us."

"The pair of us!" exclaimed Guy, "the pair of us! Listen to me, Phipson; what would be the most unwarrantable presumption on your part might in another case——"

"Whisht!" said Phipson. "Keep it back for me. Here's my uncle's man with a face like fate. What if the powder has miscarried!"

Mr. Gault's valet approached them. His master was not very well, he said, and would be glad to see Dr. Rae in the library.

Phipson wrung the hand of Guy gravely and almost tenderly—at least this was how it struck the servant.

"I don't know what will come of this," whispered he, "but we'll hope for the best. Maybe he didn't give it a fair trial yet."

"I will not allow the suspicion of a jest on this subject," said Guy. "Be off with you, Phipson! I am surprised that, with a forehead like yours, you should have the power of rational speech."

"I'd be the world's wonder if I kept that same power here for a week," and with this Phipson skipped after his uncle's valet.

The doctor found Mr. Gault in his library, surrounded by Culpeper on "The Practice of Physick," in seventeen several books, containing five hundred and thirteen observations on famous cures.

"I am profoundly unwell, Phipson," said Mr. Gault. "Take that chair, please; examine this powder, and tell me plainly what its effects might be on the digestive organs of so fragile a being as myself."

Guy strolled away from the garden, down through the horse-chestnut avenue, and out at the park gates.

"If the curate has a proper sense of his responsibilities in the matter of this scheme of mine," he said, as he stood to survey the road on either hand, "some parochial affair will be taking him this way almost immediately; for I should be glad to hear from him again about his capitalist."

He took the road towards Oxshott, sauntering to where it dipped abruptly, and wound thence with large soft curves amid a vale of sunlit heather. The curate was not in sight, but at the foot of the hill he saw Miss Gault dismount from her tricycle, and commence to push it upwards.

He hurried to meet her, and took the tricycle from her hand.

They mounted the hill together.

"How is your arm?" said Miss Gault. "Do you think it was wise to discard the sling so soon?" for Guy had cast off that support since the morning.

"I could not go lamely into the enterprise, so I threw it away," he said. "You see, the mere show of sickness might affect the life-blood of an affair like this."

"Who drives fat oxen should himself be fat," answered Trona, who caught an echo of Shakspere in Guy's last words, and saw no harm in capping him with Johnson.

She looked exceedingly nice that afternoon; her face, like the Milky Way, "a meeting of gentle lights without a name," her slender figure winsome in millinery which took the form of a riding-habit adapted to the tricycle. The perfect riding-habit is perfectly simple; the tricycle permits a little license in ornament. The riding-dress is the only wear for which the Englishwoman seeks no foreign model, and in which alone she is a pattern to the world. The adaptation of the riding-habit to the tricycle is one of the prettiest innovations in modern millinery. Trona wore a close gown of fine tan-coloured cloth with the hem braided in faint gold.

Guy observed her and approved. Then he fell into another mood.

The sharp and vivid beauty of the afternoon, which was exceptionally ripe and fragrant for early summer, touched Guy the more acutely that it woke in him memories of the days when he first burned for the triumphs of a life that had been lost to him since last he was at home in June. It was rarely that he sang at this time, but the buried

passion of the past rose up on a sudden, and seized and swept him back into its sphere. All at once, pushing Miss Gault's tricycle mechanically up the hill, he burst into song.

Miss Gault was astonished; a thousand surprises glistened in her eyes. She took a sidelong glance at the singer, but was not displeased to observe that he was quite unconscious of her presence. It was not to her that he sang, though it is possible that her presence a moment before had contributed to the inspiration that moved him. But the music that issued from his lips had response in her face. It was manly music, such as might justly shake even a young lady who was capable of rigging the market. Miss Gault, in a word, was enchanted; and when Guy, quite careless of her under the momentary spell which his voice had cast upon himself, brought the off hind-wheel of the tricycle into contact with her tan-coloured frock, she merely laid a finger on the handle-bar and set it straight again. Who said that music is the food of love?

"I knew that you ought to sing!" she said, when Guy had finished. "At least, I knew that yours was a singer's voice, but I couldn't have supposed that you would sing like that. Is it possible that you have never made any use of—of such a great g—gift?"

"There was a time when I was to have been a very great singer," answered Guy with that ineffable earnestness and gravity of manner, at once childlike and sagelike, which almost always saved his egotism from offence. "It did not happen, however," he added, "and that is the end of the story. Perhaps you can tell me the name of that herb on the top of the bank there. I have forgotten it, but it is one of the simples well known by our grandmothers, and an excellent specific for liver. I am sorry that herb medicines are so little reputed, or so much despised, in these days; but in Paris I heard of an Italian who is said to have revived their use with great success. Pardon me, the subject does not interest you, I believe."

It did not; the song was still flowing in her ears. But she looked towards where he pointed her, though she did not see the herb which was good for the liver. She had neither the voice nor the heart of flattery in her, else she might at this point have said something, or looked something, which would have prompted Guy to an expression proper to the situation. She did not say anything. In certain circumstances, and with certain temperaments, nothing is more difficult than to conjure up the spirit of love in conventional and practical shape. Old amateur philosophers (the majority of whom knew the distemper only as a subject for speculation) said that you should stand still and make a circle. This was the way to evoke the passion in a lady. But to do this presupposes a fixed and deliberate design, which is not agreeable to simple love. Trona and Guy were not persons of that quirk. Trona was moved, but she said nothing to show it. Guy, being already in love with her, had not sung with intention to allure, and did not perceive the effect he had produced. So they climbed the hill in silence.

At the top they met the curate, carrying his hat behind his back on account of the sun; and Mr. Craig engaged Guy for a visit to the City.

"Then Mr. Craig is also one of us?" said Trona.

"He has a capitalist in the family," answered Guy.

"And a telegram will ensure us a luncheon at his expense any morning," said Mr. Craig. "I have a letter from him to that effect."

"They lunch a great deal in the City, I believe," said Trona.

"They have no end of a time!" said Mr. Craig. "It's one big picnic. You call on a man in the City and he's just going out to have what he calls a snack. He takes you out with him, and after that, if you know any other fellows, you're sure to meet them all, and they're all going to have snacks, and they all take you with them. And the snacks are principally champagne with anything light on the counter to balance it. My cousin, who has introduced me to several people in the City, says that companies are floated on snacks nowadays. But I shouldn't approve of it every day, of course. I have to go up now and then to get my dividends, and somehow all the fellows I know in the City seem hungrier than usual on those days."

"But our company is not going to be floated on snacks," said Trona. "However, you had better come up and dine, Mr. Craig, and you shall hear what Papa has to say about it."

"I should like it very much, but we have a meeting to-night to discuss 'The possible future of the Manual Labourer in view of the probable decline of the Landed Owner.' Those are the words on the programme. Rather a warm question for the time of year, isn't it? I've been voted to the chair, on the ground that I must be a strictly impartial critic, because I can't be expected to know whether my bread will be buttered better or worse in an age of socialism than it is at present."

"I propose to butter the bread of the world at a very cheap rate presently," said Guy. "Perhaps I may look in at the meeting later on, and say a word or two on food reform. This scheme of mine is a purely democratic one, but it will stand as well under one system of government as under another, and no economic arrangement of the future will be able to overlook it. Suppose we fix the day after to-morrow for a visit to your cousin in the City, Mr. Craig?"

"I'll clinch the appointment by the next post," answered the curate. "Ha! Miss Gault, there's your first dinner-bell. I know the punctual habits of Mr. Gault; don't let me be responsible for a moment's irregularity on your part."

"Very well. Good-bye! I'm sorry you can't come with us. Mind you impress your cousin properly about the company."

"Our friend Mr. Gault is not quite well this evening," said Guy to Trona, when the curate had gone to join the socialists.

"Do you mean Papa?" said Trona.

"Papa, apart from the scheme," replied Guy.

"But he is never quite well when Cousin Phipson is with us. I mean when Phipson is with us Papa

passes himself in review, and wants a new prescription. He believes ever so much in Phipson——"

"Who is quite unable to embrace the notion of a scheme like mine. Phipson, although a surgeon, is dreadfully typical of professional medicine, which is the most conservative calling in the world, and the chief opponent of healthy living. Our friend Mr. Gault must certainly be saved from Phipson. It is, of course, impossible that the powder has disagreed with him; but it is by no means impossible that Phipson may have endeavoured to give him that idea."

"But whatever Cousin Phipson says, Papa will believe," said Trona.

"In that case," responded Guy, "unless nature herself cries out against him, we must submit to a temporary check. It may be Phipson's fate to bar the progress of the race for a week or two; and I doubt whether he could conquer fate."

"But he must not conquer our scheme," said Trona.

"No one can conquer what is commended by essential necessity. He will be spared that ultimate reproach."

"If we can save him from it ourselves, it will be so much time gained," said Trona.

They had to scamper home from the top of the hill, and though Trona allowed herself only ten minutes for dressing, Mr. Gault's patience suffered the strain of a full thirty seconds.

The meal commenced ominously, so far as the host was concerned, for he had none of M. Rohand before him. Yet his voice was tenderness itself when he said—by way of second grace—"I trust that most of us may be spared the miseries of dyspepsia!"

"The most of us have a touch of it," put in Phipson.

"I hope you do not say that lightly, Phipson," said Mr. Gault, with some emotion.

"We have, but we don't know it," answered Phipson, with that great cheerfulness of his. "'Tis the stomach we don't understand."

"Ah! The stomach, the stomach!" said Mr. Gault.

"What have you to say about that organ, Phipson?" inquired Guy, gravely.

"Well, now, don't we abuse it powerfully?" returned Phipson.

"There you are, of course, right," said Guy. "The rich abuse it through feeding too abundantly; the poor through feeding coarsely, irregularly, and insufficiently. We must return to first principles. We must feed regularly, but with the simplicity of little children. There must be an end of flushed faces, and the sense of oppression at the pit of the stomach. This is what M. Rohand is to do for us."

"I hope Phipson has told you, Papa," observed Trona, "how cordially Mr. Warwick was received by Colonel Capperley. You have never lost faith in Colonel Capperley, you know."

"He tasted the—the powder?" queried Mr. Gault.

"He has sent it for analysis," said Guy.

"I wonder now," observed Mr. Gault, "whether Capperley has ever suffered from dyspepsia. Town life predisposes to it, of course; but Colonel Capperley is a very careful man. Despite the hurry and excitement of his business, he commits fewer physiological sins than any person I am acquainted with."

"He lunched on lobster and champagne," said Guy.

"It was a terrible fog," said Mr. Gault. "But he tasted the—the powder, you say?"

"He has promised that his chemist shall analyse it," said Guy.

"Capperley's great on analysis," murmured Phipson.

"It showed his confidence in it," said Trona.

"I am certain of it," said Guy.

"I have always thought him a very shrewd man," said Mr. Gault.

"His place wouldn't be worth a week's purchase if he put an indigestible thing before the public," said Phipson.

"Indigestion is the evil of evils," said Mr. Gault.

"It is of all evils the most curable," said Guy.

"There isn't a doctor has abolished it," said Phipson.

"M. Rohand is not a doctor," said Trona.

"I am profoundly unwell!" said Mr. Gault for the second time that day, as he rose from the table.

"Papa is no good!" whispered Trona to Guy. "He has taken a prejudice against the powder."

The next day Guy was home again. In parting with him Mr. Gault had said, with an air of perfect friendliness, that, whatever might be the cause of indigestion, its results were the same; and he detailed the symptoms. Guy still wanted £500.

### CHAPTER XIII.—UNIMPORTANT.

MEANWHILE, the curate had made up his mind. He was in love with Miss Warwick, and had all at once decided himself on that point to his own satisfaction.

Mr. Craig had achieved some reputation as a match-maker in his parish, and was proud of having done so. He had a feminine delight in marriage, and had succeeded in tying several couples who had no idea that they had not fastened the knot themselves. In China, where match-making is a recognised and not unremunerative profession, he would have made money by it. In his parish he made no money by it (except when the fees fell to him), but the practice increased his zest of life; so he promoted picnics, tennis-parties, reading-clubs, botanical excursions, Shakspere readings, mixed cooking classes, and other innocent games designed to further the end of matrimony. Perhaps in some things he was too little mindful of the proprieties and duties of his professional position.

In uncivilised communities woman is commonly secured in wedlock by being purchased or captured. There are survivals of both customs in civilised life. Marriage by capture is called elopement in

our day, and the money marriage is the modern equivalent of the ancient marriage by purchase. But both forms have become seriously complicated by the introduction of a passion called romantic love, the joys and pains of which are not known to the savage, and which civilised antiquity knew chiefly by intuition. The curate was a romanticist in love.

In that case how could he be a match-maker? since a prime condition of romantic love is absolute freedom of choice.

The discreet match-maker assists to their choice the doubtful, the timid, and the waverers. In its ideal aspect match-making is a beautiful calling, demanding sensibility, sympathy, tact, and other delicate gifts. The curate viewed this art on its humanitarian and on its æsthetic side.

But he languished with an inward and gentle envy when any two of his unconscious pupils got safely over the question of questions, for he had never satisfied himself how it should be put; and, profoundly convinced that woman in love is at her best and most resourceful, and man in love at his most foolish and his most inept, he looked forward wistfully to the enfranchising of woman in the matter of the great proposal. "How graciously woman would woo, and how fluently!"

He went down the hill, after parting from Guy and Trona, with a keen and disquieting presentiment that his hour was at hand. Theoretically, he had always believed that "'twere well it were done quickly," arguing that studied eloquence is usually fatal to the issue, and that, the shorter the time for preparing it, the more natural the proposal mus' be. Then he remembered that ever so many people had said that nature was only the perfection of art, and, of course, the perfection of art involved a good deal of preparation. Where was his match-making now? Professors are rarely perfect save on the theoretic side of their art.

He took his way over a stile and along a footpath that led him through meadows where the grass was nearly ready for the scythe, back to the village of Deershott. The footpath ran in a direct line to the church and through the churchyard, on the western slope of a hill. As he passed under the chancel window, he heard a strain of organ music from within.

"Miss Warwick is practising," he said.

At that moment nothing was needed to complete his subjugation but Miss Warwick's touch on the organ. He paused under the window, absorbing every note as she gave it forth. Music was a passion with him, but nature had denied him the power of musical expression. He could neither play nor sing; and desiring above all things to sing, he had first been drawn towards Miss Warwick by a good-natured suggestion of hers that he should take the bass solo in an Easter anthem. This was more kind than well considered on her part, but the vicar interposed a charitable veto at the last moment, and no harm was done.

He stood in the porch, hot and irresolute, gave himself half a minute for rallying, and was still there, shifting from one foot to the other and inventing and rejecting forms of words, at the end of a minute and a half. O for a love charm or the power to work spells!

"Some are very bold at it, others are humble. I wonder whether they like the bold or the humble proposal better?" he thought. He recalled the case of the pair whom he had most recently assisted to unite, a land-surveyor's pupil and the youthful widow of a maltster; but in that case the suitor had certainly been helped to the point by the discreet good-nature of the widow.

"Widows, of course, know what you are driving at, directly," he thought; "but I have known girls who screamed and said, 'How dare you?'" He half wished that Grace were a widow.

At the end of three minutes the music ceased, and Grace herself appeared in the porch.

"Oh, Mr. Craig, how hot you look! Have you been playing cricket? Do you know, I think the organ is a little out of tune."

"Out of tune, Miss Craig? The organ out of tune? Do you really think the organ is out of tune?" ("Why, it is as easy as anything, when you've found your voice!" he thought.) "I shall have that looked into at once, though of course your word is sufficient, and more than sufficient. So you really think the organ is out of tune, Miss Grace? I wonder that never occurred to us before. I wonder—— No, I haven't been doing any cricket. Do you know, I think I should like to listen to you playing Mendelssohn on the organ all day. Of course I mean if the organ were in tune; though really I don't believe our organ, or any other organ, could sound very much out of tune while you were playing on it. I——"

Then a sudden nervousness took him, as the fear arose whether all or any of this were germane to the purpose in his heart; whether it were even reasonable speech for any human crisis.

A momentary mystification on Miss Warwick's part issued in a clear perception that she was on the point of receiving an offer of marriage.

"Would you mind my calling on Mrs. Warwick to-morrow?" was Mr. Craig's next throw. He usually called there about five times in the week, but sometimes only four.

"I'm sure mamma would be delighted. Am I to be out of the way?" answered Grace with becoming gravity; wondering what caused man to be so awkward and so foolish in a situation which called for such a nice and firm address.

"Oh, no, no. Not out of the way. I couldn't have meant to--but I'm delaying you, Miss Warwick. Perhaps you wouldn't mind my walking with you a little. The fact is that I—thank you; you are always so considerate."

Miss Warwick had acquiesced in his proposal to accompany her, by smilingly quitting the porch in the direction of home.

"So you really think the organ is out of tune, Miss War—, Miss Grace? I feel myself in sympathy with the organ. I am a little out of tune to-day myself."

"That is very unusual with you, Mr. Craig."

"Yes, it is. It is indeed. Quite unusual with me. But there is a cause, a most unusual cause. Oh! Miss War—, Miss Grace, permit me to say something which will relieve you—I mean, which will relieve me of an anxiety, a strain, which has

become unendurable. You were kind enough to say the other day, when I attempted to sing a little Mendelssohn to your accompaniment, that it gave you pleasure to note the improvement, the slight improvement, of course, in my singing. Oh, Miss Grace, if you could only bring yourself to tell me that I was not quite indifferent to you when you spoke those kind, those refreshing words. It was my heart which sang that day, Miss Grace, not my voice. But the words, you remember the words? I felt that the words were my own."

"But the words amounted—very nearly, at least—to—to a proposal of marriage, Mr. Craig; poetically put, you know."

"May I dare—will you refuse to hear—if I repeat them now?"

"Without the music, Mr. Craig?"

"You smile! Ah! but it is not a cruel smile—what smile of yours could be cruel! Miss Grace, Grace, I—I have repeated the words!"

"I think I prefer them with the music," said Miss Warwick. "But don't look so miserable at that. When you call to-morrow, if I am not out of the way, pernaps we will sing them together, and mamma shall accompany us."

### CHAPTER XIV.—NEWEST NEWS.

MRS. Warwick was a little put out by her son's sudden return from the manor-house.

"If you had only waited one day longer, dear. I have ordered some new clothes for you; they will be home this evening."

"Dear mother, it was very thoughtful of you. They will still be serviceable. Let them be put away with care."

"Put away? But I want you to wear them, Guy."

"An entire new suit, mother! All at once! The time has not come for such prodigality. In my club in Paris, last Christmas, we raised a new suit amongst us by subscription. By distributing it carefully it lasted us till Easter, and was the means of marrying three of the club. It is the club's second best suit at present, the trio who married subscribed a new one between them as a parting gift."

"What a shocking existence, dear Guy! I only hope you never had to distribute your meals in the same way."

"Our distribution of meals, mother, was like the distribution of good and evil." An enigmatical response not intended to convey exact information.

"I hope that doesn't mean that you were ever hungry, dear; but I'm sure it's a blessing you are home again, and going to make a fortune, too, which no one deserves more, considering all that you must have gone through in Paris. But you haven't heard the newest news of all, Guy! Mr. Craig has proposed."

"Proposed? What has he proposed? We are to lunch to-morrow with his relative in the City. Has he proposed anything else?"

"He has proposed for Grace."

"I think he ought first to have mentioned it to me. Grace could not very well accompany us to luncheon in the City. We shall be talking of things that she would not understand."

"Oh! my dear, dear boy, what are you thinking of? He wants to marry Grace."

"That is a different matter altogether," said Guy.

"I think myself that it is a most excellent matter," said Mrs. Warwick. "He is the most good-natured man, and so talented, and willing to oblige in everything; and he has told me this morning that there is a living in his family as well as a capitalist, and really I think it is the very thing for Grace. He might be a bishop some day, you know. The bishop lives not five miles from the parish which will be Mr. Craig's one day, so it would be a most natural thing, would it not? For of course he will often be at the palace, and the bishop is certain to take a fancy to him. At the very least they will be sure to make him a rural dean, or something of that sort, and he has two hundred a year of his own besides his curacy. Really, what with Grace's marriage, and the fortune you are going to make, I shall have no head to order dinner for a month to come."

"We will sacrifice appetite for that time, mother. As a matter of discipline, it is sometimes well merely to eat when one would prefer to dine. It is a principle which I have put to the test of practice. Yes, I think we may marry Grace to the curate. It is not a matter of the last importance, but she would no doubt expect us to marry her some day. The match is not unequal; and equality, of one kind or another, is the first condition of successful marriage."

"I think, you know," said Mrs. Warwick, "that Grace is quite able to be the wife of a bishop."

"I have no doubt, dear mother, that abundant time will be allowed her to prepare for that part."

"Well, of course, we must not expect everything at once, Guy. As I said, the bishop's palace is five miles away from Mr. Craig's rectory; and there is no denying that bishops do live to a very advanced age in these days, which of course is an advantage in many ways, as it gives them an opportunity of providing for their families, and I could not bear to think of Grace being left uncared for in the world. But you have not told me, dear, how you—how you liked Miss Gault on closer acquaintance."

"Ah! if there were only she in this affair!" exclaimed Guy. "What makes enthusiasm, I wonder, and why is it so rare, since there is nothing else but that and devotion which drive the world? I shall read you her prospectus, mother; her soul is there; she has spoken to me in it, though none of the speculators will ever imagine that. Can you conceive a prospectus which hits the speculator square, and is at the same time the intimate confession of one heart to another?"

Mrs. Warwick looked a trifle perturbed. "But Mr. Gault, dear, surely you have had no unpleasantness with him?"

"He is what dyspepsia has made him," answered Guy. "It is impossible that I should be offended with him. His case affords one of the strongest arguments for the necessity of such an undertaking as mine. But I have decided to dispense with him."

He got up from the garden bench, and paced the tiny terrace impetuously.

"Guy," said his mother, "I am quite sure that something has gone wrong. Why don't you tell me?"

"I will tell you, mother, when I have read the telegram," answered Guy; for as he spoke the telegraph messenger from Oxshott station came through the wicket with a yellow envelope in his hand. Guy opened it, and read the message.

"Let me see you to-morrow.—Capperley."

"It is settled," said Guy to his mother. "The analyst has reported. I have only to fix my terms."

# Courtship or Marriage?

MARRIAGE is an ordered garden,
  Courtship, a sweet tangled wood;
Marriage is the sober Summer,
  Courtship, Spring, in wayward mood;
Marriage is a deep, still river,
  Courtship, a bright laughing stream;
Marriage is a dear possession,
  Courtship, a perplexing dream:
Which of these, my wife, shall be
Crowned as best by thee and me?

Marriage is the blue day's beauty,
  Courtship, the capricious morn;
Marriage is the sweet Rose gathered,
  Courtship, bud still fenced with thorn;
Marriage is the pearl in setting,
  Courtship is the dangerous dive;
Marriage the full comb of honey,
  Courtship, the new-buzzing hive:
—Which of these, dear wife, shall be
First preferred by thee and me?

O, the tangled wood was lovely,
  When we found it, in our play,
Parting curiously the branches
  White with masses of the May,
Eagerly the paths exploring
  Leading to we knew not where,
Save that million flowers edged them,
  And that bird-songs lit the air,
Thrushes' joy-notes, Philomela's
  Still more exquisite despair.

How we wandered!—Now our wild wood
  Has become a garden-plot,
Something missed of that strange sweetness,
  In the method of our lot.
—Ordered walks, and formal borders
  For the wood-paths strange and wild,
Rose superb, and stately lily,
  Where the careless wood flowers smiled,
—Summer, grave and sober matron,
  For young Spring, the eager child:
Which, O which preferred shall be,
Twelve-years' wife, by thee and me?

Nay, the garden has its glory,
  Stately flower and fruit mature;
And the wild wood had its dearness,
  Strange delights and wonders pure;
And the summer has fulfilment,
  If the spring has promise-store;
And the river is the deeper,
  If the young brook laugheth more;
And the real joy abideth,
  When the teasing dreams are o'er.

And the broad blue sky has glories,
  If the morn was wildly fair;
And the gathered rose is safer,
  If the buds more piquant were;
And the pearl is rare and precious,
  If the dive was full of glee;
And we would not change our honey,
  For the flower-quest of the bee;
—Sweet is Courtship; sweet is Marriage:
  Crown them, darling, equally![1]

J. R. VERNON.

## COST OF A LONDON FOG.

A LONDON fog is not merely a cheerless and disagreeable, but also a very costly affair. Some years ago, after a day of regular fog in the month of January, the following statement was issued by the "Gas Light and Coke Company":—"Ninety million cubic feet of gas were sent out during the twenty-four hours ending at midnight. This quantity was an increase on that of the corresponding day in the previous year (which may be taken as an ordinary January day) of 37 per cent., or over thirty-five million cubic feet."

The price was at that time three shillings per thousand cubic feet, so that the public had to pay to this one company £5,250 extra on account of the fog. No less than 9,500 tons of coal were carbonised during the twenty-four hours to produce 90,000,000 cubic feet of gas—the largest quantity ever sent out in one day by the Gas Light and Coke Company.

Let it be remembered that this was the quantity ascertained and declared by only one of the Companies supplying gas to the public; others having also an enormous production, such as the South Metropolitan Gas Company, the strike at the works

[1] From "Valentines to my Wife"—one section of a new and characteristic volume, entitled "Gleanings after Harvest; or, Idylls of the Home," by the author of "The Harvest of a Quiet Eye" (Cassell).

of which at Lambeth last year caused so much difficulty and annoyance. What was the total amount over the average, due to that January day's fog, there are no statistics to show; but it is evident that the cost to the public for additional light must be very great.

Nor is it by gas-bills only that the cost of a fog is to be reckoned, in the matter of artificial light. Gas meters and the records of Gas Companies afford some approximate statistics, but how can we reckon the total expense to the multitudes who use candles and lamps of every kind?

Many readers will remember the famous "Economical Project," as he called it, of Benjamin Franklin. He thus introduced his plan to the people of Paris. "I was the other evening in a grand company, where the new lamp of M. Lange was exhibited, and much admired for its splendour. But inquiry was made, whether the oil it consumed was not in proportion to the light it afforded; in which case there would be no saving in the use of it. No one present could satisfy us in that point; but I was pleased to see the general concern for economy, for I love economy exceedingly." A few days after, Franklin published his project, which was no other than a recommendation to use sunlight more, and artificial light less. The paper is in Franklin's best style, full of sound sense and genial humour, but our reference to it is only on account of the calculation he makes as to the cost of candle-light. Suppose, he says, there are 100,000 families in Paris, and that these families consume in the night half a pound of bougies, or candles, per hour. Taking one family with another this, he thought, a moderate estimate. In the six months between March 20 and September 20 there are 183 nights, during 7 hours of which candles are burnt; in all 1,281 hours. These hours multiplied by 100,000 give the total of 128,100,000 hours. At the current price of wax and tallow, he demonstrated that the city of Paris could save 96,075,000 livres, in the half year, by early rising and using sunlight! There would be also considerable saving in the other six months, though the days are shorter. It is pleasant to recall this *jeu d'esprit* of Franklin, as it sets us a-thinking what must be the actual cost of candle-light and lamp-light in the hundreds of thousands of houses and work-rooms, shops and offices, during a regular London fog.

There are many things besides the increased expense for light that must be counted in the cost of a fog. We wonder how much the railway companies have to pay for the detonating signals, heard on every line and near every station, on a foggy morning or evening, for the safety of the crowds of passengers, as well as of property. Inquiry at one of the chief stations failed to obtain any trustworthy estimate of this expense.

The largest and most serious loss due to fog is caused by the total cessation of labour and traffic on the river. Not the steamers only, but the barges and lighters and boats of every kind, have to be laid up, to avoid collision and other mishaps; and work has to be suspended at the riverside wharves and quays. On some occasions, when the fog has been dense and long-continued, the commercial loss has been enormous, and the poor labourers have also suffered from the enforced suspension of business on the river.

Shopkeepers detest fogs because customers avoid dark days for shopping, and "carriage people" stay at home. Cabmen dislike them, from the waste of time and the damage to which their vehicles are liable. Drivers of omnibuses, and of wheeled vehicles of every sort, know the danger, especially as it is almost impossible to discern the customary signal of raising the hand or the whip, which warns those behind to stop. The crash of broken panels is no infrequent sound amidst the gloom. To some outdoor trades and occupations a fog puts a complete stop, and many an indoor industry is seriously hindered. One winter, not long ago, there was a loud complaint from painters, and colour-printers, and artists, that the fogs interfered so much with their work that the loss to them was very great. In fact, to all sorts and conditions of men, except to thieves and rogues, a London fog is an injury and a nuisance.

A far more serious thing is the loss of life inevitable during a fog. Some years ago there was an unusual visitation during the time of the Cattle Show at Islington, and not a few of the animals perished. At the Cattle Show of 1890 there were also many casualties from pulmonary disease caused by the fog, including the Queen's prize ox, which had to be slaughtered. It may be said that this was natural, as the fat, overfed pigs and oxen had difficulty enough in breathing even when the air was clear. But the fatal effect of the fog was much commented on at the time, and may now remind us how injurious it is to men as well as to animals. There may in ordinary fog be no remarkable or immediate increase in the rate of mortality, but the permanent mischief done to those of delicate lungs and feeble constitution tells afterwards.

Then there is scarcely a fog in which fatal accidents are not reported, either in the streets or on the river. Every winter a certain number of persons are struck down and maimed or actually slain in the confusion and darkness of a London fog. We may well wish success to all undertakings which give promise of lessening the evils of such visitations, whether by larger introduction of electric light, or draining the Essex marshes, or compelling chimneys to consume their own smoke.

A recent statement by Mr. Sowerby at a meeting of the Royal Botanic Society shows that the loss is large in the vegetable as well as in the animal world. In answer to a question by Professor Bentley, Vice-President of the Society, the Secretary said the destructive action of fog on plants was most felt by those tropical plants in the society's houses of which the natural habitat was one exposed to sunshine. Plants growing in forests or under tree shade did not so directly feel the want of light; but then, again, a London or town fog not only shaded the plants, but contained smoke, sulphur, and other deleterious agents, which were perhaps as deadly to vegetable vitality as absence of light. Soft, tender-leaved plants, and aquatics, such as the *Victoria regia*, suffered more from fog than any class of plants.

## SOME WOMEN'S MANNERS AND WAYS.

BY THE AUTHOR OF "VOICES FROM THE HIGHWAYS," ETC.

"I AM in a thoroughly bad temper," said Pleasance, as we sat down to lunch.

"Dear me, that is not like your name," I said, "nor your looks either," I added, as I glanced at her. For to anybody not quite familiar with her, she would have seemed radiant with good nature and good spirits, though my initiated vision could detect what one old friend calls "a fierce spark" in her eye, and "a fine friskiness" about the silvering hair, which never will cease waving above her open forehead.

"I have been visiting Miss Lee, the drawing teacher," said Pleasance. "She is in quite low spirits, because all her own expenses—rent, taxes, and servant's wages—are coming upon her, and she just falls short of the needful cash because three or four of her lady pupils have not yet paid her for teaching she gave them nearly two years ago. You see, they engaged her for certain courses, say, of twelve or twenty lessons, and then, to suit some convenience of their own, such as visitors at home or an invitation from home, interrupted their course, say at the tenth or eighteenth lesson, and, not having yet chosen to complete it, seem to ignore the fact that payment was due when the course should have been completed, when Miss Lee was quite ready to complete it, and for which of course she had made all her pecuniary arrangements."

"Miss Lee ought to fix the time for payment in the middle of the course," said I, "and she ought not to allow her pupils any right to break it. If they wish to do so, she may, of course, permit it, but distinctly as a favour only."

Pleasance shook her head knowingly. "And then Miss Lee would get the reputation of being exacting and disobliging," she answered, "and that would be the greatest injury of all. For if she got the ill-word of that kind-hearted Mrs. Carew, of Montford Park—such an excellent woman, you know, patroness of every bazaar, and promoter of every good work—how many would be inclined to believe that poor Miss Lee had done nothing to deserve it? For it is Mrs. Carew who is one of these unjust women who contribute this last straw of worry and uncertainty to a hard-working and meritorious life."

"It is done in thoughtlessness," I said; "though I use that explanation as no excuse."

"It is too euphemistic!" cried Pleasance, "we are blinding our eyes—especially we women—by using these softer terms, which give a sort of innocent grace or attractive mystery to what are just plain sins! We begin to call treachery, tact; and lies, fibbing; and drunkenness, over-stimulation! This 'thoughtlessness' is simply sheer vulgar selfishness and disregard for the rights of others."

"I am afraid that disregard for others' rights, an indisposition to look not only 'on one's own things, but also on the things of others,' is a besetting weakness of our poor sex, Pleasance," said I. "I think it is John Ruskin who somewhere says, in his rather sweeping fashion, that he has come across very few women who seem to realize that there is anybody else in the world except themselves and their own children! Oddly enough, I have spent

this morning in reading Sir Walter Scott's journals, and they bristle with the same indictment! He instances one lady who thought her admiration of his genius entitled her to ask him to send her all the Waverley Novels then published, and the new volumes as fast as they came out! Another lady wrote him a letter, requesting him to give his name to a story of her own writing! A widow who had once visited Sir Walter's mother addressed him, requesting him to write to Mr. Peel (then in the Cabinet, and afterwards Sir Robert), saying, on her authority, that her second son was a youth of infinite merit and accomplishment, quite fit for any position in any public office, and requiring that he be at once provided for thus! I must admit, however, that the great author seems to have had many masculine correspondents equally deficient in modesty and delicacy."

"Ay, but I am inclined to maintain," said Pleasance, "that even in many of these cases you would find these were weak men, egged on by mothers or wives. Scripture itself gives us an instance, in the vaulting petition of the mother of Zebedee's children! Now do not accuse me of over-stating feminine influence over men, for you know I always maintain it is looked at and considered too much to the exclusion of the immense influence men have over women; but I maintain that the selfishness which may be equal in both sexes (and here the people who imagine women are all adorable by nature may shriek if they like!) manifests itself pre-eminently in some women, by their capacity for petty push and grasp, and by their callous indifference to the rights or feelings of others. Is a queue of people waiting at a ticket-office, who is it who, arriving late, tries to insinuate herself into a foremost place? In nine cases out of ten, a well-dressed British matron! She tries to put herself in front of some astonished gentleman, and if he shows a little mild resistance, not so much, perhaps, for his own sake, as in the interests of common justice and courteous consideration for better-bred women patiently waiting farther back, then does his tacit reproof recall her to any consciousness of misdoing? Not a bit of it! A scowl, and perhaps even a muttering, hints that he is not 'very gentlemanly.' When I was a girl, in the days when fashion dictated that foolish women of not fastidious feelings should trail a yard of skirt on the dirty ground, I remember coming out of a crowded meeting behind a person whose train spread along, so that a gentleman could not avoid treading on it, and nearly stumbled in his effort to avoid doing so. She turned upon him sharply, saying: 'One might at least beg pardon.' 'Madam,' said he, 'I was just wondering you did not do so.'"

"I remember a comical incident in my Highland journey last autumn," I said. "The coach put our party down at a little inn where the horses were changed, and the passengers could get lunch on their thirty miles' drive. We—there were but myself and another lady—were accordingly shown into the only parlour the primitive little house could boast. We found it already occupied by a tourist family who were evidently boarding there for a few days, but room was made for us at the dining-table, and our tea and eggs were brought in. Now it is not likely that this family had made their arrangements without understanding the necessities of the local coach, the only means of transit in the neighbourhood. Even if they had been misled, which is most improbable, the bone of contention would lie between them and the landlord, and the commonest sense of courteous hospitality would have dictated that no affront should be offered to the innocent travellers, who might as justly have resented that no room was retained for the private use of the coach's passengers! But the mother of the resident family, a stout, comfortable-looking person, of about fifty years of age, addressed her husband in a tirade about 'the disagreeableness of having strangers thrust into one's apartment, sitting eating their food before one's eyes' (and our very inoffensive viands might have been pots of beer and strings of sausages by the tone of contemptuous disgust which she threw into her voice as she mentioned them!). Then she evidently got some sign of disapproval from her husband—I think it must have been a touch of his foot beneath the table—but instead of this checking her, she made matters worse, both for us and for him, by going on: 'Oh, you may make believe you don't mind it to-day, but you make fuss enough sometimes, and you like it just as little as anybody.'"

"Ah," said Pleasance, "I always travel in dread of the unpleasant women who enter railway carriages and seize on all the windows and ventilators to close them without any reference to the wish of previous occupants. Then they take up the coolest seat, and if you gaspingly suggest that an exchange with you (who have your back to the engine) would allow a window to be opened without subjecting them to any undue current of air, they fix you with a stony gaze, and say they are quite unable to travel save with their faces looking forward. A quiet persistency to maintain one's absolute rights becomes a duty in such cases, since it may tend to hinder this arrogant self-regard from asserting itself quite so strenuously on some future occasion, and so spare real suffering to some nervous or timid traveller."

"And what railway passenger," said I, "does not know the half-bred girl whose flippant levity of manner emboldens some under-bred youth to ask her permission to smoke his cigar on forbidden ground, and who, when her giggling consent is set aside by the grave reminder of some wiser woman, thinks she makes herself girlishly graceful and agreeable by indulging in cheap little witticisms about 'old frumps,' 'too selfish to let others enjoy what they can't appreciate'?"

"I believe that young person," observed Pleasance, "eventually develops into the middle-aged dame who voluntarily enters a smoking carriage when there is plenty of room for her elsewhere, and then, as soon as the train starts, says, 'I object to smoking, and no gentleman who is a gentleman will take advantage of my position to inflict suffering upon me.' And what an amount of harm must she have done in the course of her transformation from one form of selfishness to the other!

Penelope Boughton tells me that down in her

district there is no branch of work more hopeful than the classes for working boys under sixteen. However rough-and-tumble they are, they are always affectionate, and generally amenable to gentle discipline and influence. But with the lads between sixteen and twenty, it is—as a whole—widely different. They seem mistrustful and suspicious of any efforts to please or benefit them, are saucy in manner, scornfully indifferent to all wholesome interests, and actually ashamed of all that is best in themselves! She and I debated over that mysterious difference for a long time, but at last certain little insights which we had, led us to the conclusion that it was mainly due to their advancing years opening them up to ill-regulated young feminine influence, which exerted itself in scoffing at whatever it felt to be superior to itself, and in gibes at submission to any of those social restraints which the wise voluntarily accept, and feel no more irksome than decent clothing is to a civilised person! Thereupon the lads felt put 'on their mettle' to defend their liberties against the encroachments of 'the frumps'! And I fancy many a mother and sister and aunt in a far different class of society could tell much the same story, as they sit deserted among their disregarded efforts to make homes bright and happy! And their loving hearts can certainly take no comfort in the grim thought that they are sure to be better understood and bitterly regretted when it is too late!"

"Ah," I sighed, "it has often shocked me to see how, sometimes to gratify a mean vanity, sometimes out of spiteful inquisitiveness, sometimes in the very guise of kindliness itself, women, other than mere flighty girls, will recklessly undermine or damage the influence or authority which is really responsible for the welfare of young lives. Such a question and remark as, 'Is your auntie very strict with you? You see, she's had no little ones of her own, and mayn't know how to make allowance for boys' ways,' will raise a doubt in an orphaned nephew's breast, which any chance friction may rub into sheer rebellion. 'I suppose Dr. Blank does not allow you much liberty? He is very rigid about hours and acquaintances, isn't he? Does Mrs. Blank keep a good table? Well, don't let them kill you with over-work. I think you look rather pale,'—and the lad is sent home to his tutor's house, chafed and restive."

"Yes," said Pleasance, "I recollect Mrs. Yeldham saying that in her husband's tutorial days she often felt very keenly about the thoughtless way outsiders act towards young folks who have found a home in the home of others. They do their very utmost to nullify the growth of that home feeling in whose encouragement lies any true advantage of such a position. The merest acquaintance—somebody perhaps only seen once or twice—will send such young people invitations for those very occasions on which anything like a family circle should keep itself intact,—such, for instance, as Christmas dinner or New Year's Eve. Of course, where the young people have warm hearts and fine feelings, they remain loyal to their adopted roof, and no harm is done. But many are thoughtless, flighty, and always ready for change of any sort,—and then the house-mother has to carry on her hospitality with a crippled programme and a chilled enthusiasm, or else to give an ungracious hint, and to feel that she has detained an unwilling guest to cast a shadow instead of a sunbeam on her festive board. Some of Mrs. Yeldham's friends who had never been in a similar position told her that she was too sensitive on this subject, and that nobody else would think of being hurt by such things, and poor Mrs. Yeldham, always ready to believe herself a little overstrained and exacting, tried to give herself that discipline which is called 'schooling down the heart.' But presently she got an opportunity of testing the soundness of the feeling.

"At Mr. Yeldham's recommendation, a youth, a stranger in this country, had gone to live in the family of a clergyman's widow, a practical matter-of-fact person, only too unlikely to give undue weight to sentimental considerations. When Christmas came round, Mrs. Yeldham felt this boy a little on her mind. He had brought introductions to her husband; he was alone in a strange land. If it had been so wrong of her to resent mere acquaintances' Christmas invitations to her housemates, then it would be wrong of her not to extend a similar invitation to this lad. He, and even the clergyman's widow herself, might actually think her silence cold and negligent. Her friends had been ready to suggest that her own charges had been asked out, partly to relieve her from all responsibility concerning them; and the clergyman's widow might much more look at things from this point, since she had children of her own coming home from a distance, and might well like to have them all to herself during their brief visit. Still Mrs. Yeldham could not so far forget her own previous feelings as to ignore their possibility in another. So she resolved to proceed cautiously. She paid a private call on the clergyman's widow, told her she was thinking about this boy, and would like to show him seasonable kindness, but, as regarded the Christmas Day invitation, would ask the widow's own wish and act upon that. The lady looked up at her with her strong, sensible face. 'Thank you for giving me the opportunity of saying I'd rather you did not do it,' she said, 'for if there is any use in our trying to give them a home feeling, it is just these occasions which give us any possibility of success.' Whereupon Mrs. Yeldham assured her of her warm sympathy, and returned home rejoicing that she was not quite so hypersensitive and 'imaginative' as she had been led to believe herself."

"Well, Pleasance," I said, "I think that story further brings out a sound principle—that of putting oneself into others' place, if we would really find out how to act kindly and wisely towards them. People do so many things which are, as they say, 'no harm,' and yet which do actual harm by inflicting wounds and pain. There are actions which are like fruit seeds, not only innocuous, but bearing good promise, which yet, by being done in the wrong way or place, may become as detrimental as is a fruit seed sticking in one's gullet! For instance, money must pass between parents and teachers, but is it pretty that 'mamma' should come bustling into the schoolroom, and count out the governess's little golden guerdon in the presence of her pupils?

When a husband gives an old family friend a pair of cosy winter gloves, is it necessary that his wife should tell the old friend that 'he has paid for them twice as much as she ever pays for her own,' the fact being that her yearly glove bill will be far more than twenty times that of the other lady? Is it in good taste to be always pressingly forward in loading a poorer friend with costly gifts, but never to mingle with these little attentions of personal help and service, almost more welcome to an over-driven life, and certainly far sweeter to a gentle and noble mind?"

"I think," said Pleasance, "that young married women are great sinners in the way of failing to realise that other lives have avocations as exacting and far more exhausting than the delightful natural duties they find so engrossing. There was something quite comical in the way that little Mrs. Newby, with her two children and her four highly trained servants, considered herself quite 'too busy' to show anybody the same social civilities and domestic furtherances, which she herself always unhesitatingly demanded from her husband's maiden aunt, who kept a ladies' school, had an invalid sister upstairs, and two very primitive domestics in the kitchen. You see, Mrs. Newby had so many 'anxieties' about the babies' frills, and her weekly kettledrum, and the floral decoration of her dinner table, whereas the maiden aunt had no cares more important than the physical and spiritual well-being of her pupils, the difficult payment of her bills, and the constant dread of her sister's removal by death. Of course, such a busy woman as Mrs. Newby had a perfect right to be nervous and irritable sometimes. But woe be to the maiden aunt if she showed any similar signs."

I am afraid Pleasance can be bitter sometimes.

She went on again.

"You know I always maintain that men and women are far more alike than they are different. Not very many of either sex are capable of high friendship. If women are jealous of each other, so are men. And yet I own there is a curious and almost indefinable distinction between them in these matters which we are discussing, which distinction is not to the credit of the women. For instance, women go out of their way to inflict pain or contumely on each other, even when there is no question of revenge or spite, or scarcely of personal knowledge. I have no doubt some men are quite as purse-proud or house-proud as some women, but generally they will simply neglect those whom they outshine. The woman wishes to drive home her triumph and enjoy it with the flavour of somebody's humiliation. For instance, I know a woman who lives in a big house near a very tiny vicarage. When the new vicar brought home his bride, this woman somehow managed to slur over a call, but sent the young pair an invitation, which they accepted, wishing to live in peace and amity, and make the best of their neighbours. The amusement she offered the bride was to go from attic to basement of her vast establishment, telling her all the while how inadequate it was to "anybody's" requirements, and how she was planning new additions. Afterwards she said to the vicar, 'Your wife is a sweet little creature, I hope she will often come in to see me. I fear I offended your predecessor's wife. She invited me to spend an evening with her in that little place, and I was quite ill next day with the closeness of that cupboard of a parlour! And what do you think—in the simplicity of my heart, and only wondering how she managed to bear it always, I told her the plain truth. I could see she was angry! I suppose it was very dreadful of me—it was—wasn't it? But I'm sure I meant no harm.'"

"What did the vicar say?" I asked.

"I don't know what he said to her. Nothing, I suspect," Pleasance answered. "But in telling the story to me, he said drily, 'I was struck by the ingenuity of the method by which she conveyed to me that she did not think my house was worthy for her to visit.'"

"I remember," I said, "being very much shocked to hear a kindly and observant man remark that it seemed to him that few women have among themselves any share of that which among men is called 'honour.' He had been started on that line of observation when he was a little schoolboy, sitting unnoticed over his books in a parlour full of young women. A lady coming up the avenue became the subject of a series of unfavourable comments and criticisms. She was 'fast'; she took airs; she aped talent; she was stupid; did you ever hear her singing through her nose? 'Pretty! nobody could think her pretty—except herself. What an awful bore if she is coming to visit! Yes; she is. Can we find any pretext for asking her to sing. If not, let us get her on the subject of voice-culture, and you will hear how much she takes upon herself.' Enter the visitor. Whereupon the young ladies surrounded her with greetings, put their arms about her neck, kissed her on both cheeks, called her a dear and a darling, and besought her to give them the pleasure of hearing her sing the song which they had heard had thrilled all hearts at last week's conversazione. And then they revelled in the credulity with which the poor girl fell into their snares! That little boy learned a terrible lesson as to the possibilities of feminine treachery."

"You bring me back to what I said before," Pleasance answered. "I have heard men make remarks about others as spiteful and severe as those which you repeat. But those men would not straightway fawn upon the object of their contempt, and profess an unctuous joy in his society. If any man did so, his fellows would instantly dub him a cad and a sneak. And yet too many men only laugh when they detect women in these mean treacheries! Only last week a 'society' journal said airily, as a matter of course, that women are allowed to speak and behave in ways which would cause the immediate ostracism of a man. Don't you think that some of this falseness is due to the way in which that quality called 'amiability' is exalted to be the universal feminine ideal? In their dread of forfeiting this attribute women seek to disguise any instinctive dislike or well-grounded aversion, and issue their particular criticisms under the mask of professed good-will. Men are to blame for much of this, for

the candid opinion of sister or friend is often laughed away as 'sheer jealousy.' We hear a great deal about men being what women make them; but reverse the proverb, and it is equally true: women are what men make them. Any sensible and truthful woman, reviewing her own life, will admit the influence, either for good or for evil, that they have had upon herself, and will be probably far more conscious of good influence she has received than of any she has bestowed."

I am silent for a few minutes. For knowing something of Pleasance's history, I can guess what rises to her own thoughts. He whom she loved was not made worthy by her love, and when the day came that the two paths went apart, there was no question with Pleasance as to "which keeps the sorrow and which the blame," for she keeps them both herself! The two paths are still going on—ever farther and farther apart. How does God govern the end of these tragedies? For can Pleasance ever forget? No. We must leave it in God's hands, and when we see what He will bring to pass, we shall be satisfied.

Pleasance went on again with all her usual cheerfulness.

"I think the virtue about which women should examine themselves and their ways is truthfulness! I do think it is the lack of this which underlies much bad manners, and social treachery, and petty injustice. I think I see what it was that shocked me so in Mrs. Carew's withholding Miss Lee's hire. I know plenty of men who would do likewise among their employed, but then they are men who would rather glory in any shabby trick that brought them a little gain, or if they do make any profession of philanthropy or religion, such profession is distinctly understood as only part of their business equipage. But I am quite sure Mrs. Carew believes herself to be one of the kindest-hearted and most considerate of women. She does not search into her grounds for this opinion. It is simply the character which she desires, and she assumes it. In this instance, want of truthfulness is shown by the facility of self-deception. In cases of arrogant disregard of others' rights and feelings, it is displayed by the undue estimate of one's own personality, again ignoring all inquiry into its foundations. We see it in another aspect, crying out under every blow, as if the world might abound in pain and loss, but this sacred personality should have claims for special and life-long exemption."

"Yet what wonderful instances of the faculty of accepting one's own personality as a mere insignificant item of the general plan of things one sometimes finds among those who have been schooled by the hardest facts of life," I observed. "A good old woman in the workhouse said to me: 'It's not my blame, nor nobody's, that I'm here. Only there's some have to go through a great deal compared with what is set for others. The sea is rich at the bottom, and my treasures are there.' For husband and sons had been drowned. And what true dignity there is beneath the self-suppression! For, after all,

> 'Of broken shells God maketh, when He wills,
> The everlasting marble of His hills.'

"Then, in the abounding cases of feminine social treachery and double dealing—things so common, that one can scarcely turn one's head without encountering a new instance thereof," Pleasance went on, "this same quality of falseness comes manifoldly forward in the desire to ape amiability and yet achieve the ends of malice. I know a woman quite lately who wished to convey a reproof. (She had made no impartial inquiry into the circumstances which she rashly judged deserved it.) And she conveyed it, in texts of scripture, written in red ink on a post-card from which she withheld her name!"

"Women have been too much taught to regard themselves in the reflection of others' opinions," I said. "And so they seek to produce a pleasant impression there, regardless of reality—like those faded beauties who never approach a looking-glass till their maids have tinted their cheeks and piled on their false hair. True goodness and honesty of heart and life troubles itself as little about opinions as healthy youth does about mirrors!"

As I spoke I went to the bookcase. "I want," I said, "to look up a little work by one of the great doctors of the English Church, who declares that a lack of impartial justice is a crying defect in women which needs to be made good. He deprecates that merely emotional side of the religious life, seemingly all that is visible to many women, who vaunt a religion miscalled of 'love,' which simply means a confusion of all distinction between right and wrong, a currying of favour with sinners *in* their sins rather than any seeking to save them *from* such. Their mawkish utterances and compliances come perilously near to Isaiah's strong indictment against those who 'call evil good and good evil,' who 'take away the righteousness of the upright from him,' by petty insinuation and antagonism, and who 'justify the wicked for reward,' by condoning in wealthy relatives, 'whom it would not pay to offend,' lines of action which would not be tolerated for a moment in any labourer or servant to whom wages are paid!"

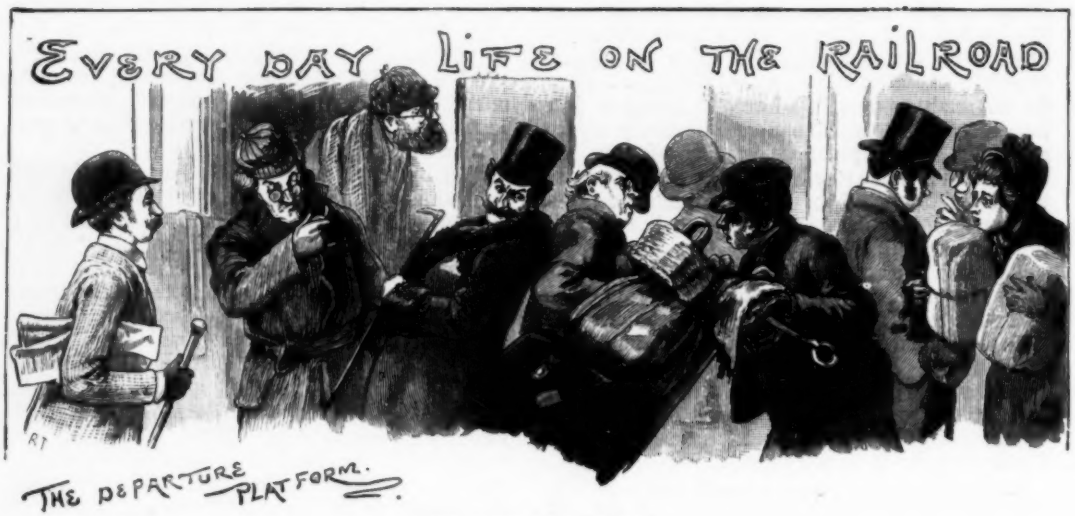
I had found my place. I went on: "Listen to what Canon Littledale says:

"'I cannot see that a woman would become less lovable by sharing in justice—that attribute of the Supreme Loveliness, and I do see very clearly the remorseless cruelty of the wounds which women will inflict on men and on each other daily, just because they are not deterred by a sense of justice. Men are less emotionally compassionate than women, but men rarely stab one another with the personal stilettos of concentrated spite which women are apt to wield; and, above all, men are loth to strike a *fallen* enemy, whereas too many women delight in trampling on him to the last.'

"Again, he agrees with you, Pleasance, that 'there is a lower standard of truthfulness amongst women than among men, not so much in deliberate and conscious mendacity—though even in that department an accomplished female impostor is far the superior of men—as small social hypocrisies, continual inaccuracy, and a marked tendency to exaggeration.' He attributes the two latter faults to imperfect mental training, and the former he sets down as a result of 'the physical weakness

and social inferiority which have put women for so many centuries under the feet of men.' He accuses them, also, of a sin which has, I fear, wrought to their present complexity many of the worst social problems of to-day, 'the determination to have a thing without giving a fair price for it.' He thinks this 'may grow out of the inactive lives led by too many women, which make them incapable of understanding the value of labour, especially of skilled labour, and of time. . . . They do not realise manual industry as being a just integer of cost; and therefore constantly try to get articles at a price below that of the raw material of manufacture.' But he does not excuse this on the ground of scientific ignorance, believing that its origin is moral, and lies in 'the imperfect sense of justice.'

"Then he turns to his own sex, and owns that he looks 'in vain for any instruction, in the pulpit or in most books of spiritual reading, which deals with such feminine defects as those' which we have been discussing."



"I maintain that all men owe the duty of showing as much contempt and indignation for a woman's falseness as for a man's," said Pleasance. "It is the bitterest insult to the sex when they don't."

"My author is prepared to assert that it is 'the feminine way of regarding theology, and not the masculine, which is in the ascendant among us.' 'Preachers have acted, consciously or unconsciously, on the principle that there is no use in trying to influence men, and that it is better to devote their energies to women, *as they now are*, and the policy has, of course, ended in creating the premises from which it apparently started.' Whereas, in his opinion (and I am inclined entirely to agree with him), that 'subjection of woman,' which treats her not as the daughter of God, but as an appanage of man, requiring no qualities but such as shall 'please' her 'master,' is no outgrowth of Christianity, 'but is an unmitigated evil which Christianity did not even tolerate, as it did slavery, with the intent of ultimately destroying it.' For it is a striking fact 'that the ancient Christian Church, recognising woman's separate responsibility for her actions, and having a great career for her, did not merely abolish the old invidious restrictions, but threw open to her all the stores of learning, all the methods of education, then available. The early teachers of Christendom did not content themselves with stimulating the emotions, affections, and submissiveness of women into disproportionate prominence . . . but they did aim at strengthening them where they are weaker, in solid reflection, in breadth of view, in accuracy of reasoning, in justice of aim, in steadfastness of purpose.' He sets before us the galaxy of early Christian women who were famous not only for their character and virtues, but also for their learning and judgment."

"I don't think just now that women are quite remarkable for 'submissiveness,'" murmured Pleasance. "It does not strike me as their 'disproportionate' quality!"

"And yet you too seldom find a woman bravely maintaining her own ideal of right against the avarice or ambition of a husband, or the lust of a son, or the luxury of a friend," I replied. "As for the rest, we know that slaves—especially those slaves who are spoiled for their master's pleasure—are characteristically full of insolence and 'cheek.' The African valets and table maids of Southern slavery are an illustration ready to hand. Modesty, reticence, and self-restraint are essentially the virtues of a responsible freedom. I think I am inclined to agree with Canon Littledale, who seems to look for the further development of true womanhood in the seeking back among the roots of Christianity to the ideal there propounded to her,—the active life of bringing up children, using hospitality to strangers, showing honour to the saints, relieving the afflicted, and diligently following every good work. No woman can set herself to these duties—not, mind, as mere 'graces,' in some amateur fashion, but accepting them as the only basis on which she can justify her existence, and recognising that they bring her questions of right and wrong which must be promptly answered every hour by corresponding actions—without acquiring humility, patience, and firmness, and discovering her need for the best of all culture, physical, mental, and moral. And so shall she fulfil the grand ideal of the beautiful lines:

'Every woman is, or ought to be, a cathedral,
Built on the ancient plan—a cathedral pure and perfect—
Built by that only law, that Use be suggester of Beauty.
Nothing concealed that is done, but all things done to adornment;
Meanest utilities seized as occasions to grace and embellish.'"

ON THE PLATFORM.

A TRAIN of 110 vehicles, with 4 engines in front and one pushing behind, is lengthy enough for a stretch of the imagination; and yet it was in such a train that the people returned from Edinburgh after seeing the Queen in 1842. Nowadays we manage our excursion traffic differently. Instead of cramming all the passengers into one train, no matter how many they be, we divide the crowd into sections, and despatch these in separate trains one after another at "block" intervals.

If any one will see how a great excursion traffic is handled with success, let him give the Great Northern a trial and pay two visits to Doncaster, one in August and one on the St. Leger day. In August he will find the sidings full of goods trains and coal trains; on the roads into the works there will be the usual parade of injured rolling stock awaiting its turn for repair; and in the shops, amid the clang of the hammer and the scream of the saw, he will find a small army busy in a wilderness of bands and wheels.

In the St. Leger week all this is changed; the workmen make holiday, the works are closed, the goods and minerals are not allowed to stop on the sidings, and the engines and carriages come for repair are either run off to be shunted further down the line or locked in the silent shops. The block sections around are cut into half lengths by extra signal cabins. Every siding is numbered, and the number in huge figures is like a target. Every train that is due in has a corresponding number, and hung on to its engine funnel is a board with a big placard showing in large type the stations to which it will return.

Here, then, are numbered sidings, numbered trains to shunt into those sidings, and bills clearly showing what these trains are to do. But something more is required. As the trains run in on the day of the race, every passenger is given a handbill telling him the number of his train, the number and position of the siding in which he will find it at night, and the time it will start.

Whatever the sight on the Town Moor may be, there is no question that Doncaster station-yard is worth seeing while the great race is being run. The whole area is one mass of these conspicuously labelled trains, come from all points of the compass. Say there are a hundred of them, and there are only one or two less; there they stand all at attention, with steam up and staff waiting ready for the rush. At five o'clock it comes; the station is black with crowds, handbills in hand. The trains are like hives thick with stormers, and fill as quickly as if the people had been poured into them. At a quarter to six there is a terrific whistle from an engine, and No. 1 train is off; in a little over a minute off goes No. 2. In five minutes four trains have gone; in the next five four more. In an hour fifty have gone; in two hours they have all gone, and the sidings are silent and empty.

The fine roomy station at Liverpool Street on a Bank Holiday, or, still better, the Epping Forest stations, afford another example of dealing with a plethora of passengers, but in this case the organisation is not so much in evidence or so satisfactory. The longer excursions of the Great Eastern to the North Sea coast afford far more favourable examples of what that rising company can do. Some of these are cheap enough to recall the days of the great competition, when the passenger fare from Leeds to London was five shillings, and occasionally half-a-crown. The man in the moon was wise in inquiring the way to Norwich; should he

ever reach that favoured city in an afternoon, he will be able to go from there to Cromer and back, fifty miles, for the small sum of one shilling.

The London line that has most specials is the South Western. There is not a week passes without Waterloo having to deal with a race or a review, or some excuse for a flood of excursions with which to complicate the ordinary traffic. Portsmouth, Aldershot, Bisley, Ascot, Epsom, and Parks irrepressible afford a continual round of gaiety to the South Western. From its special trains a large amount of its income is derived. When the fact of the University boat race taking place at too early an hour in the morning means a loss of 20,000 passengers, no wonder the special traffic is thought worth cultivation. During the afternoon of the Jubilee Review, the South Western ran 72 specials between London and Aldershot; and when the Derby was in its prime Waterloo has worked 125 specials to and from Epsom; but the Epsom work is now shared by the Brighton Company, who spoilt the South Western game with their station on the Downs. Since that station was opened the Waterloo traffic has dropped considerably, though the total amount passing through Clapham Junction is much as it used to be.

Clapham Junction—which is not in Clapham at all, but a mile away from it—is one of the busiest of the suburban junctions round London. Between five o'clock in the morning and midnight, a passenger train, up or down, stops at Clapham Junction every two minutes. Of these 600 trains, the South Western is responsible for over 340 to and from Waterloo; the Brighton, to and from Victoria, provide less than half as many; and the Kensington and other trains that start from the Junction make up the remainder. These 600 trains, be it understood, are ordinary passenger trains only, and no account is taken of the specials and expresses that do not stop, or of the goods and empties, which, taking the year through, would probably total up to half as many again. One of the curiosities of the traffic is that while the South Western stops fewer trains on the way to Waterloo than on the way from Waterloo, the Brighton reverses the policy and stops more trains on the way in than on the way out.

Waterloo is the largest passenger station in this country: that is to say, it covers a greater area. And it is the busiest station, for in and out of it there pass about 700 trains a day, and not even the busy Great Eastern comes up to this, although Liverpool Street deals with the larger crowd. The reason is obvious: a South Western train averages 150 passengers, a Great Eastern train averages over 400.

When the South Western was young it had no intention of stopping at Waterloo. The plan was to get at least as far as Barclay and Perkins' brewery, if it could not cross the Thames by Southwark Bridge. In fact the South Eastern road from Charing Cross to Cannon Street was simply the revival of the old South Western project. The terminus at Waterloo was a making the best of the inevitable, and a growth under difficulties from small beginnings; and no South Western official will feel annoyed at being told that one would have thought as much from appearances. Architectural features it has none; it is a mere aggregate of platforms spreading like a fan, and cut up into groups by the most unpretending of offices.

Contrasting with it in every way is St. Pancras, a station with a really fine frontage, and worked simply and straightforwardly under one roof, with nothing to break the view, though how St. Pancras unaltered could deal with the same number of trains at a time as Waterloo is not quite clear. It is, however, a model station, and a wonderful one. The trains really run in the roof; the tie beams that one usually sees aloft stretch across under the platforms, and the girders of the great arch, spanning as many feet as there are pence in a pound, come right down into the ground. The brick walls that are visible are but screens; and the offices, though on the level of the road, are practically in the parapet. The true building that carries the roof is below the level of the metals. In it the storage space, chiefly used for beer, is gigantic. Below its foundations runs the City branch, which has to cross the canal before it can rise into Camden Town; and in addition to this curving tunnel under the stores, there is a spare tunnel under the front of the hotel for the Metropolitan to use with a double line of rails, when need arises; and below the tunnels flows the once famous river Fleet safely wrapped in a drain pipe.

There are thus three floors of rails: the one which the passengers use, the middle one by which the stores are worked, and the lowest for the City traffic. And the unit of measurement from which the proportions of this vast building had to be designed was no other than that familiar object—the common beer barrel.

When the station was projected "it was determined," says Mr. Williams, the Midland historian, "that iron columns and girders, instead of brick piers and arches, should be used; and as the area was to be devoted to the accommodation of Burton beer traffic, the distances between the supports were arranged at such intervals as to allow of the largest number of barrels of beer being placed between them. These distances were found to be 29 ft. 4 in. As the great outline of the superstructure had necessarily to be adjusted to the position of the supports below, the unit of the entire fabric came to be founded on the length of a barrel of beer."

To come to London and make this station and the immense goods depot alongside cost the Midland £9,000,000. Time was when the Midland thought of amalgamating with the North Western and running its trains into an enlarged Euston. Those were the days of the Great Northern war, when the Northern ran a train into the Midland preserve at Nottingham, and just as it was about to return loaded with passengers, the Midlanders made a capture of the engine. Here was a notable episode in everyday life on the railroad: a Northern engine, peaceably backing, finds itself cut off from its train by a Midland engine rushing in from the siding. Halting to consider, the Northern driver sees a second Midland engine backing up the

first; striving to escape, he finds a Midland engine in front of him, and another behind that; slowly the enemies advance, deliberately take the Northern engine prisoner, and run off with it between them into shed!

Then the day of the olive branch dawned, and the foes became friends for a time, and the Midland traffic came to King's Cross. But the Northern could not carry the double load; the state of affairs became exasperating. "This year 1,000 Midland passenger trains and 2,400 Midland goods trains were delayed in the thirty-two miles between Hitchin and London." There was no help for it; the octopus of Derby must get a tentacle into London, and to do it was well worth all the money spent.

Attempts are sometimes made to compare American railways with ours. The only comparison must be contrast, so different are the conditions. In this country a railway is bitterly opposed and discouraged, there it is warmly welcomed; here the line has to pass a Government inspection, and be so solidly and evenly built as to bear about the same relation to an American line as a first-class carriage does to a trolly, the object of the Americans being to lay the line at the fastest possible rate, and chance the accidents which occupy so prominent a place in transatlantic telegrams. The number of American railroad accidents is a wonder. Taking the returns of only one month, the last month available, we find eighty-five collisions, eighty-two derailments, and eleven miscellaneous disasters. This is an ordinary month, with no sensational catastrophe to distinguish it, and it means that three times as many railway accidents occur in the United States in a month as in Great Britain in a year. Another point worth remembrance is that in this crowded country the company has to pay for every yard of land, while there it not only gets its land for nothing, but thousands of acres into the bargain, so that the statist of a hundred years hence when that land is occupied will be able to show that to start with American railroads cost considerably less than nothing, while those of old-fashioned Britain cost £50,000 a mile.

Once, as we have said, the Midland was coming into Euston; so was the Great Western. In fact it obtained its Act of Parliament on the understanding that it was to effect its junction with the London and Birmingham in a field between the Canal and the Harrow Road at the western side of Kensal Green Cemetery; and it was only when the scheme of a joint station was abandoned that Paddington was thought of. The two small departure platforms and the outward parcel offices at Euston now stand on the site of what was intended to be the Great Western terminus.

There is a healthy well-to-do look about Paddington which no other station possesses. It is the most English of railway stations. Whatever be its order of architecture—and it seems to be less of the Palladian than of the nothing in particular—it is unobtrusive and comfortable. And when on a summer's day its departure platform is busy with luggage and passengers bound to the west, a pleasanter picture will be sought in vain.

But somehow there is never much stress at Paddington; the work goes easily and without fuss, for the traffic is a level one. Not so that of the North Western or the Northern, particularly in August. Those who would see station work at full power should look in at Euston on the eve of St. Grouse, or an evening or so before, between, say, seven and eight.

Slowly the empty train runs in from the cleaning shed eleven miles away. The paint is as bright as new after its rub down with paraffin, and the glass is without a smear after the abundant sousings from the Willesden tanks. The North Western chiefs are fully alive to the value of a good advertisement, and keep their expresses quite up to the standard of the locals they send as object lessons on foreign lines. That standard is a high one. Even at Victoria the trimness of the occasional North Western train is noticeable, at Waterloo it is more apparent, at Herne Hill the dingy Chathams make it painfully obtrusive, and at Croydon it and the South Eastern curiosities seem to have come from different worlds. Of course it is a cheap triumph, but it is a legitimate one.

The train, then, appears at the platform, a thoroughly respectable, workmanlike "turn-out," to use the familiar expression of the road—and, by the way, had we spoken of "coaches" instead of "carriages" we should have been more technically accurate. What are its colours? Chocolate and white, we are told; but the railway nomenclature of colour is not always the popular one. The Midland engines, for instance, are officially described as "brown," and the South Eastern coaches are "Wellington brown," the colour being that of the Duke of Wellington's livery, and having been adopted to tempt the old hero, who then lived at Walmer, to take a ride on the new line. Great care is exercised in keeping these colours true. At Wolverton, at Swindon, at Derby, and the other great carriage works, there are steam grinding-mills constantly preparing the colour to pattern. Railway carriage painting is like roadway carriage painting and house painting as practised in Holland; it means an indefinite number of coats, pumiced and sandpapered and laid one on the other, till the proper gloss is attained.

There have been many suggestions as to the colour of railway coaches. The prevalent notion is that each company should have its own combination by way of advertising its existence, but there are not wanting some people who insist that every class should have its colour, and some even go so far as to require that the carriage should be the colour of the ticket. If this were adopted, unless the whole ticket system were to be changed, the painters in oil would find their occupation gone, for the only way to meet the demand would be with distemper. The coaches would be a different colour on the up journey from what they would be on the down; coaches for return tickets would be half and half on the outward run and single coloured on the other; and excursion ticket-holders would be accommodated in the loudest of nigger

stripes to start with, and in stripes of a totally different pattern for every day in the week on which they would return. And yet, gay as all this would make the trains, they would not look any more startling than did the Rocket, the Novelty, and the Sanspareil, when gorgeous in bright jockey colours they ran their great race at Rainhill.

When a train is in a station it is under the control of the station-master, and should it not have been lighted it is his duty to do so. The miserable oil lamp is now making its last fight on the heavy lines. The North Western have over 20,000 of these lamps in use, but they are diminishing monthly, and no one regrets them; and the fragrant old lamp-rooms with their slate tables and sawdust bins are getting themselves into trim for quite another duty. The substitution of petroleum for rape saved the Midland £10,000 a year; the substitute for petroleum will save them more. Oil, mineral or otherwise, has almost disappeared from trains that consist of the same carriages throughout the run. For single carriages and branch lines oil has its advantages, and a lamp-man's carelessness may still make travelling a misery. From York to King's Cross we once journeyed in the dark. At Grantham we asked the guard for a light. "You've got a lamp, can't you see it?" was the reply. "No," we answered, "but we can smell it!" But neither guard nor station-master could appreciate third-class humour.

It is by oil-gas that most of the lighting is now done. The manufacture is much on the same lines as that of coal-gas. The petroleum is squirted as a spray into red hot retorts to be vapourised, and passed through a hydraulic main to the condensers, and on through a scrubber to the gasholder. Thence it is pumped into a reservoir at a pressure of 150 lbs. to the square inch, and thence by means of the main it is admitted into the cylinders under the carriages at a pressure of 110 lbs. Two of these cylinders, thirteen inches in diameter and sixteen feet long, hold enough for a journey from London to Aberdeen and back, the gas being reduced to burning pressure by a system of regulators.

Some years ago the Brighton Company introduced electric lighting for their Pullman train. The electricity was obtained from accumulators which were charged from a dynamo at Victoria. Now there is a dynamo in the guard's van driven by the axle of the wheel, a compact contrivance, dynamo, accumulators and all being contained in a cupboard occupying but two feet of the length of the van. The electric light is making many friends on every railroad on which it has been introduced, and though the systems are many the results are in almost every case satisfactory to the public, though not perhaps to the shareholders. But every year more economical methods are introduced, and we live in hope that a bright, cool light will become universal.

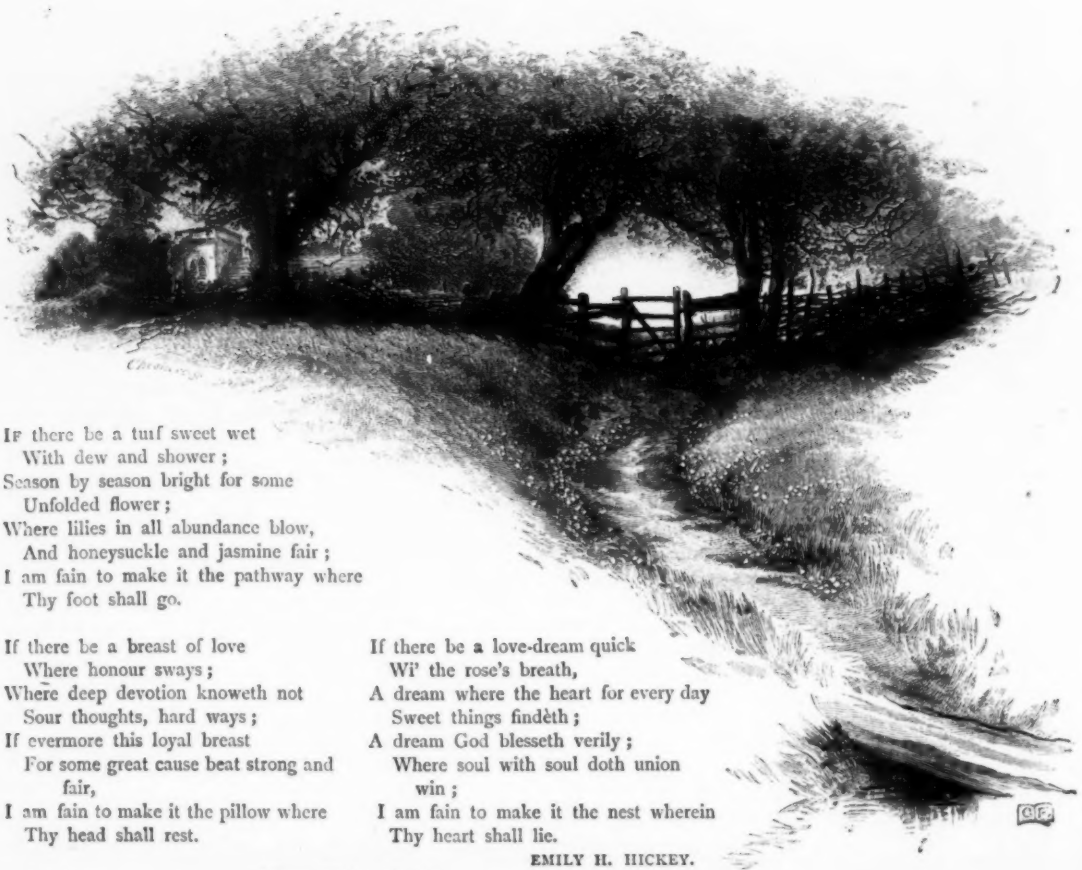
Another of the station-master's duties is to see that the carriages are properly warmed. The old hot-water foot-warmer has received notice to quit. Acetate of soda is the new solution, the advantage being that while water has to be put on the fire to be reheated, all that acetate of soda requires is a good shake. The acetate is liquefied in an iron tank, and seven quarts of it poured into each warmer, together with seven ounces of water and two cast iron marbles. The warmer is then boiled up in another tank to be fit for use. It cools slowly, and before it is quite cold it is only necessary to shake the marbles about to restore it to a comfortable temperature. In the North Western and other sleeping saloons another system is in vogue, the carriages being warmed by high pressure hot-water pipes.

Among the next improvements in the conditions of night travelling we shall probably have the abolition of the practice of waking up the passengers at the more important junctions. It has been found to be within the powers of human ingenuity to avoid an examination of tickets at four o'clock in the morning, and on one line it is reported that the porters have received instructions to announce the names of the stations in a considerate whisper. Why it is necessary for porters to shout at all is not very clear, and that the practice, even in daylight, is of any value may be doubted.

A good paper might be written on porters' cries, treating them under their several varieties as modified by local and individual circumstances. We have heard of the music of the waters as heard at Niagara: why not the music of the porters as heard on the Great Western? How varied are their accents and intonations! We can hardly expect a porter to be an elocutionist, but there might be a trifling pruning of his excrescences. The late Sir Daniel Gooch once put a stop to the exasperating misuse of the aspirate in an admirable manner. "Hacton! Hacton!" roared the man. "Dear me!" said the chairman of the Great Western from the railway carriage; "let that fellow be transferred to Hanwell; he can't give us too much *h* there." If the station had been Ealing instead of Hanwell the story would have been even better, for it so happens that Ealing, formerly Healing, has dropped the aspirate which has been so strangely picked up by the ancient Anwell.

Passing through Newton Abbot we once overheard a discussion on porters' cries. It seems they are fairly divisible into three groups. There are the mere grunts, as at Havant and Yeovil; the abbreviations, as at "Snks" (otherwise Sevenoaks) and "Drm" (as at Durham); and the jubilantly rhythmical, as the "Woodleywoodley-woodley Junc." of the M. S. and L., and that glorious crescendo of the Midland, "Mangotsfield! Mangotsfield! Change here—for Glaster and Chaltenam, Woster and Barmingham, Darby and the Narth! Glaster and Chaltenam, Woster and Barmingham, Darby and the Narth!" Between London Bridge and Victoria, it may be noted by the way, there are, or used to be, three stations, S'num, St'rum, and Bl'um, or Sydenham, Streatham, and Balham.

The carriages, having been cleaned and lighted and warmed, have also to be examined to make sure that the wheels are sound and the axles



properly lubricated. This task is, as a rule, gone through behind the scenes before the train is backed into the departure platform, but at the stations on the road it has to be done in public. For express work oil is being increasingly used; it flows more quickly, and is altogether better so long as the wheel is on the move. But when the wheel stops the oil's very fluidity results in the squeezing out of the lubricant between axle and bearing, so that the wheel starts "dry," and requires more engine power to move it. The old yellow mixture of palm oil, soap, soda, and tallow is not so squeezable, and with it the friction at the moment of starting is less; and hence our expresses are beginning to be lubricated with oil, and our stopping trains and goods trains with grease. Time was when the companies oiled their bearings with a lump of tow at the end of a hazel wand; but they do not do so now. It is not often that anything is found wrong with a tire, but twice in our travels we have seen a carriage taken off a train because the metal did not ring true. And as to the greasing, we once saw a case of workmanlike thoroughness in work which has ever since given us an interest in that generally despised occupation.

Seventeen years ago we were in the last carriage of an express that had stopped at Bedford. The wheels had all been tapped and rang true, and clicking up the lid of each axle box, the greaser was coming along the train. It seemed a mere matter of form, this lid-lifting. Click! click! wheel after wheel all right; and as the clicker reached our carriage the guard started us. The wheels began to move; the greaser clicked the first—but the box was dry!

What did he do? Let it pass? By no means. In a moment his tray was on the step, and he was on after it. As the express at fast-increasing speed ran out of the station, he threw up the axle-lids. By the time he had finished we were over the Ouse. Throwing his tray off, he sprang after it, and saved himself from falling by a long staggering run.

A very ordinary performance of merely a greaser! But the present writer is of the same opinion now as then, that the man did his work at the risk of his life, and the work was not too humble to be done by a hero.

W. J. GORDON.

If there be a turf sweet wet
With dew and shower;
Season by season bright for some
Unfolded flower;
Where lilies in all abundance blow,
And honeysuckle and jasmine fair;
I am fain to make it the pathway where
Thy foot shall go.

If there be a breast of love
Where honour sways;
Where deep devotion knoweth not
Sour thoughts, hard ways;
If evermore this loyal breast
For some great cause beat strong and fair,
I am fain to make it the pillow where
Thy head shall rest.

If there be a love-dream quick
Wi' the rose's breath,
A dream where the heart for every day
Sweet things findèth;
A dream God blesseth verily;
Where soul with soul doth union win;
I am fain to make it the nest wherein
Thy heart shall lie.

EMILY H. HICKEY.

(*From Victor Hugo.*)

# HOUSEHOLD DOGS,

## AND HOW TO CHOOSE AND TRAIN THEM.

I NEED offer no apology—and I certainly do not mean to make one—for commencing this paper with "a bit" in which Newfoundlands figure. They are household dogs *par excellence*, and one of my own pet breeds.

It is a year and a week since poor Hurricane Bob passed over to the majority. Many readers of the "Leisure Hour" will remember him as the companion of my Caravan Rambles throughout the length and breadth of Britain. I have only to add that he was faithful and loving to the end.

It is several years now since I first met Maude McKenzie down in one of the flowery lanes of bonny Berks. Not more, perhaps, than sixteen was Maude, and as fresh and beautiful as the wild daisies her feet brushed the dew from, as she came tripping along. Somewhat frightened she looked as she noticed my companion, Hurricane Bob. But frightened she need not have been, for she, too, had a Newfoundland by her side—tall as a mastiff, black as raven's wing, the blackness just relieved by the red ribbon of a tongue that peeped from his mouth, and by the two rows of alabaster teeth that flashed in the sunlight every time he glanced upwards at the face of his mistress.

There was no inherent vice about Hurricane Bob, although he was of a bounding disposition—a "Rantin' Rovin' Robin"—and would at times fight with another big black dog for the mere fun of the thing.

"Dear me, now," said Hurricane Bob, fixing his eyes on the other Newfoundland, "I'd dearly like to know whether that dog or I am the taller. Mightn't I just run over, Master, and measure shoulders with him?"

"Certainly not, Robert," I replied. I always called him Robert when talking seriously. It seemed more impressive than the simple "Bob."

"You need not feel the slightest alarm, Miss," I continued, addressing the young lady, who was kneeling on the grass with both arms thrown round her pet's great neck. "I have my dog securely by the collar. But what a lovely animal you have there!"

"I'm so glad," she said, with slightly heightened colour, "that you admire him. Every one loves Juniper."

"Juniper!" I repeated. "Strange name!"

"Protection, you know," she explained, apparently a little surprised that I should not be quite *au fait* in the language of flowers.

I met Maude often afterwards; and even Hurricane Bob and Juniper grew friendly. The girl never went anywhere without Juniper, and more than once he followed her to church, and behaved there in a most exemplary manner.

The strange sad part of my short tale comes in at the end. Maude died of consumption. And it was affecting to see poor Juniper, with anxious and wondering looks, following the funeral. There was some mystery about the matter that his canine understanding could not grasp; but when the coffin was lowered and the sods arranged, hardly could the poor fellow be persuaded to leave the churchyard. Juniper refused food then, and died within a fortnight—of grief, they said, and I can well believe it.

But my memory teems with anecdotes of the sagacity and affectionate fidelity of the noble Newfoundland dog. It is not my desire, however—albeit I mentioned him first in the list—to claim for this animal the title of *facile princeps*. My object is to write a plain, practical paper which shall be of use to the reader, whether a dweller in town or in country, who is desirous to know the best qualities of different species of dogs as companions, children's pets, or household guards. I shall also give the characters of the animals I name, and various hints which may be found useful, though they may not accord with public opinion—which generally means public fallacy.

A curious thing happened in the village near which I reside a few years ago. We were visited one winter's night by a gang of burglars. Every good house, to the number, I think, of six or seven, was requisitioned before morning, with the exception of my own and that immediately adjoining it. I possessed at that time four or five great Newfoundlands, among them my champion Theodore, Nero, Hurricane Bob, his son, and an old prize-taker called Brewer. The house next mine belongs to H. Warde, Esq., M.P., and the loot therein would have probably swelled the treasury of the burglars considerably. Owing, however, to the terrible storm my dogs brought to bear on them, they fled, although they had already broken the latch of the dining-room window in Mr. W.'s house.

The Newfoundland bitch Queen Bolina lies at my feet as I write. She is not only a great beauty, and much admired, but a splendid guard. Here at home she is free to roam the grounds all the livelong night. Of course she is not such a fool as to do so, but she sleeps with her door open, and her ears as well. The man may bring the milk in the morning, or the police-patrol may pass by, but let a strange footstep be heard, or an "unkent" voice, and loud and deep as thunder is her honest bark.

It is pleasant to hear a watch-dog bark at night. The barking only occurs when necessary, it is always accompanied with a low and threatening growl; and when we hear this we know we are safe, that the animal who watches over us is more

faithful than any human sentry ever was. And so we go to sleep again with a sweet sense of security.

During four months of the summer of 1889 I camped with my caravan and tents in a lonely spot by the sea at Deal, not far from the old ruined castle of Sandown. Queen Bolina, as soon as the sun went down, took charge of the whole bivouac. So sure were we that no one could molest us and go unpunished, that we seldom were at the pains to lock our doors. Although on the road I sometimes bivouac by night in strange and lonely places, and in camp I invariably have a pair of good revolvers handy, I trust mainly to my dogs for protection. Queen, at all events, seems to know precisely what is required of her, and my last words to her before turning in are, "Good night, old girl. *Watch!*"

The Newfoundland is a dog of immense size and strength, with plenty of bone, a magnificent head, short ears, and eyes that brim over with intelligence. There are two sorts or species—the all black, and the Landseer or black and white. Neither must have curl in the coat, nor a high-carried tail, while the jacket or feather should be very long and abundant. Newfoundlands make delightful companions for children or ladies, are the best watch-dogs in the world, and save life from the water as if by instinct. A dog of this breed, however, ought never to be chained. He is a household dog and a house-dog *par excellence*. There is little fear of him making any mistake if left loose and on guard; and it is all but impossible for thief or burglar to bribe the animal.

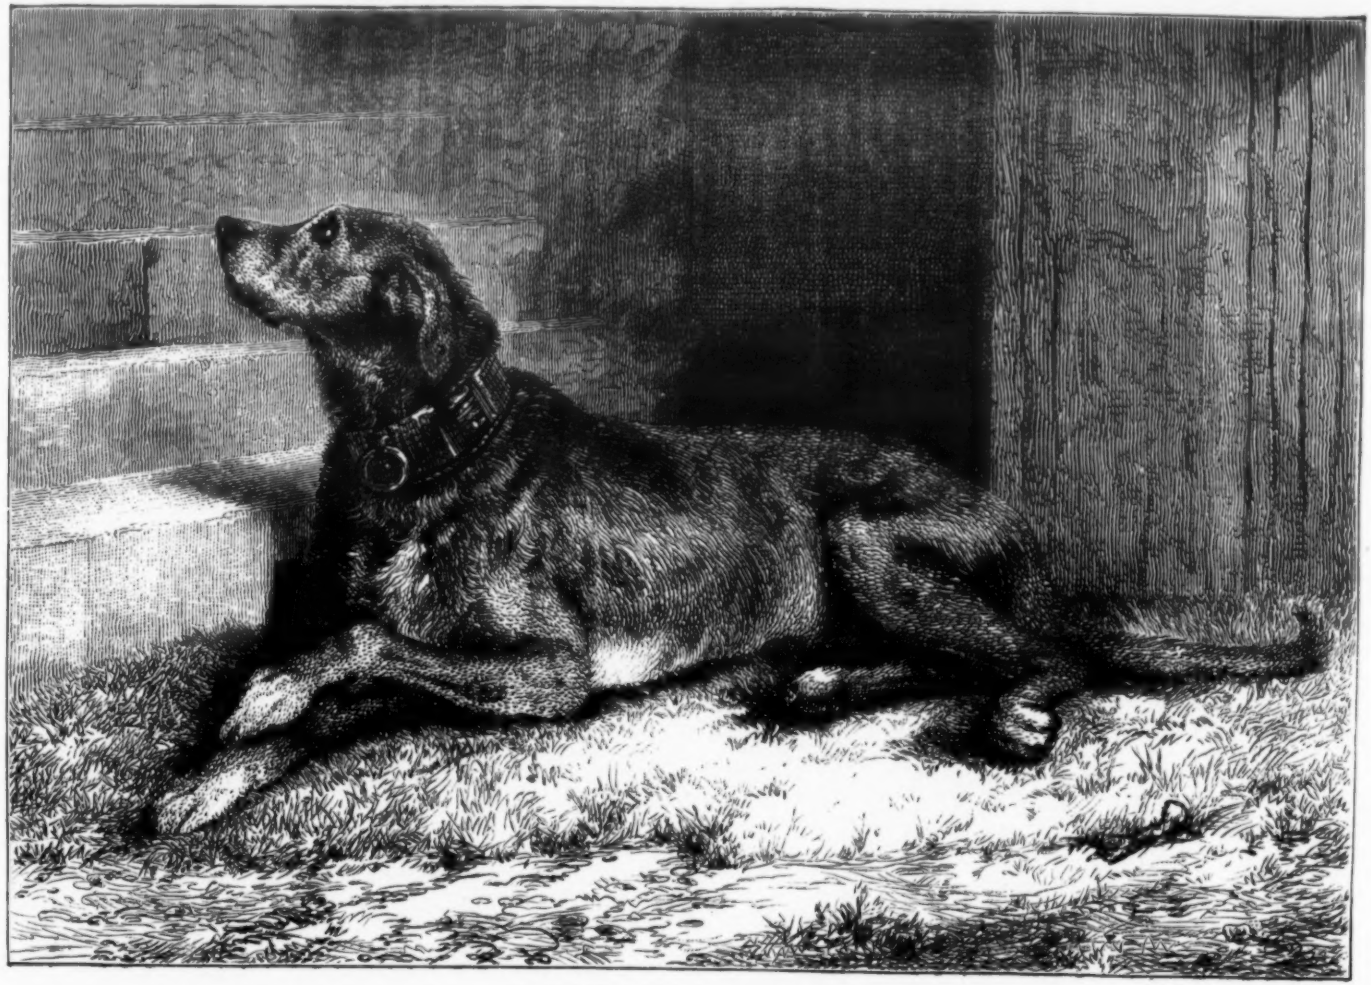
Great care is now taken with the breeding of Newfoundlands in this country. The animals may have originally come from St. John's, but they are now improved beyond all comparison with their half wild ancestors—as much in mental attributes as in bodily form.

The St. Bernard is the next dog that claims my attention. The vexed question of origin I do not mean to go into. But every one who has visited a dog-show must have been struck with the extreme and princely magnificence of this breed of dogs, with their lovely wise heads, and massive frames, covered—in the rough species—with a coat that is snow-defiant and as warm as an eider-down quilt!

Sagacious in the extreme is the St. Bernard; but for him to be of any real service the owner must make a companion of him. If he does not appreciate the qualities of the animal he possesses, or turns him into a mere outdoor kennel dog, he does not deserve to have him. Kept much on the chain these fine fellows are apt to wax sour in temper, and even fierce at times. But if well-treated, well-fed and *loved*—what a deal there is in that wee word to a dog!—you shall hardly be able to find a better guard or better companion for ladies and children.

One of the noblest of these animals recently died, the grand old Champion Save, the property of J. F. Smith, Esq., of Sheffield. The dog was quite one of the family. In the large kennels not far from the house there were seldom fewer than a score of these wondrous dogs, but there was only one Save. He used to carry wherever he went a small barrel of polished wood depending from his collar in front, after the manner of the dogs belonging to the monks of St. Bernard. It is brandy that these latter carry, for the use of the poor travellers whom their sagacity enables them to exhume from the snowdrift. Save's mission was none the less noble, for his barrel was a cash-box, into which many a silver and even gold coin found its way. The dog thus managed for many years to support a child's cot in an hospital. The poor fellow is sadly missed.

The very appearance of a St. Bernard dog at a country or even town house is in itself a protec tion against the burglar or thief.



Some of these dogs fetch enormous prices that often amount to many hundreds of pounds. The celebrated dog Plinlimmon stood about thirty-four inches high at the shoulder, and was bought for the large sum of £1,000, and is now "starring it" on the American stage. I am told that one part of his performance is to lie dead at a certain part. Plinlimmon lies dead enough to all appearance, only no power on earth can prevent him from wagging his great tail now and then. Of course dead dogs do not wag their tails, but Plinlimmon cannot be supposed to know this.

Happy indeed may the man be, and safely may he sleep at night, who is guarded by a member of the princely tribe St. Bernard.

Another monster dog is the British Mastiff. Of extraordinary strength and substance, with a muzzle that could pin and hold a bull, he is, nevertheless, possessed of kindliness of manner and extreme sagacity. He is a gentleman's dog, and himself a gentleman. While the strongest man that ever lived could not *drive* the dog, a child can lead him. It is strange but true that nearly all large dogs are extremely fond of and condescending to children, especially to master's child. I myself—though I cannot remember it—was dry-nursed, as one might call it, by an immensely large Landseer Newfoundland, in whose arms I used to go to sleep on the lea or lawn. One day I was found asleep as usual, but with my clothes sadly disarranged, and face and breast besmeared with blood. Near me lay Snap—watching. A bull-dog had come on the scene some time before, and it would appear that a terrible fight had raged around and over me, in which the Landseer was victorious. This accounted for the blood, for, like Llewellyn's child, I was intact.

Mastiffs are either outdoor or indoor dogs. They are apt to get very fierce if kept much on chain, so ought to have all the freedom it is possible to give them. They are, I need hardly say, as short-coated and as glossy as a greyhound or horse. Like most smooth-haired dogs, they are almost constantly on the moult to some extent. This and a habit that many of them have of running at the mouth when they think of or see food, are the only objections to their being indoors. But the daily use of the hair-brush and hound-glove certainly obviates the first objection to a very large extent.

Like Artemus Ward's "elerphunts," mastiffs are "powerful eaters," and therefore hardly poor men's

WAITING FOR THE MASTER.

dogs. A St. Bernard, too, is generally ready for a good substantial meal, while, on the other hand, Newfoundlands are very easily kept.

I never had the honour of possessing a Scottish deerhound, so cannot speak from experience anent their qualities as house-dogs. They are said to be good guards for either person or property, and there is no doubt they are exceedingly handsome. There is, too, that air of nobility and high breeding about them we like to associate with romance and chivalry. Scottish deerhounds follow well on the street, keeping close to heel, and, although they never provoke a street fight, are more than capable of taking their own part.

The Great Dane is a dog that I am sorry to think is rather losing ground in this country, if we may judge from the meagrely filled benches containing this class at our large shows. He is a great favourite in Germany. It is said that Prince Bismarck hardly ever moves about without one or more of these grand fellows as followers. He has recently lost one of his best. I can speak from experience concerning this breed, and, to begin, do maintain that, considering their immense size and agility, no dog could be more gentle and winning. These dogs often measure more inches at the shoulder than the tallest mastiff, and possess almost as much strength, while they have all the agility of a Scottish deerhound. They are close-coated like the mastiff, generally self-coloured or with dark spots shining through the ground colour or brindle, and I have seen some very beautiful ones almost pure white.

Roughly speaking, the Great Dane should have a long, lean, but muscular head, in shape somewhat like that of a bull-terrier; the ears are usually cut, though this habit is now written down by all sensible and kindly-hearted people. If a Great Dane be of a slate colour, the whole body will very likely be of the same hue from nose to tail-tip, even the eyes themselves and the moustache-hairs.

As a household dog it would be difficult to find its match. It will be best to let such a dog sleep in the house. He need not be in one's bedroom, for he sometimes snores rather loudly; but he may make his bed on the mat just outside the door. Woe be, or woe would be, to any dark-lanterned burglar who might get half-way upstairs. Indeed, it is highly probable your Great Dane would permit him to get nearly all the way to the top, but then * * * *—the asterisks represent the descent of the staircase by dog and burglar. By the time you come with a light the *tableau vivant* at the foot of the stair might be represented thus ?:. N.B. The mark of interrogation is your Great Dane, the mark of interjection is the burglar. Both are prone, but the dog holds the coigne of advantage, and, if you now do your duty as well as the faithful Dane has done his, that burglar will have plenty of leisure to repent of his sins for ten years to come.

On no account should Great Danes be kept upon chain. There is little fear of these animals becoming too good-natured, but, if chained, it will be quite the other way.

When purchasing dogs of large breed, for household guards, it is well to make strict enquiries into the characters of the sire and dam; if they be fierce, ten to one the son will develop the same qualities.

No large dog is worth a Spratt cake if fierce and unmanageable, or if he be subject to fits of anger. You never know when you are safe with such an animal.

We sometimes see dogs advertised for sale with the following "recommendation" (?): "Gentle by day, a demon at night." Now, what on earth is the good of a dog who is a demon at night? Such a beast is generally a superstitious coward, and a Cerberus that will accept a sop. But, supposing he were not, one would have to keep the demon on chain all night. Small good would he be then. He might give the alarm; but a tiny black-and-tan terrier, small enough to breakfast off a pigeon's egg, could do the same thing equally as well. So never buy a demon.

Talking about demons puts me in mind of keepers' dogs. They may be bull-and-mastiff, or bloodhound-and-mastiff, or any cross betwixt big breeds, say Newfoundland-and-collie or retriever-and-Newfoundland. They must be excellently well-trained, and none but a genuine keeper can bring such a dog up in the way he should go. I possessed a beautiful creature once—no irony meant—he was lovely as a dream; but, if any man but touched my shoulder, he went to ground immediately, no matter how tall he was—it is the spring and push that do the work. But this dog never bit his man, only held him down. Nor would he touch a woman or child.

The Bull-dog, albeit the appearance and shape of head and body may, in the eyes of some, detract from his beauty, is a really excellent household dog. As a rule, which admits of hardly any exceptions, the Bull-dog is faithful, kind and true: that is, if well-bred. Let him be a cross of some kind, and often enough he is a cur and a coward. The very appearance of a huge-headed red-eyed bull-dog is quite enough to scare away any ordinary night-prowler, be his "game" whatever it may. A well-trained dog of this breed will not make any mistake and go for the wrong man. Knowing his immense strength, he seems, as a rule, unwilling to proceed to extremes: but, when duty bids him, then he suddenly awakens to the necessity of doing his best. When he does begin he means business, and when he lays hold, nothing short of semi-strangulation is going to make him let go until his duty is performed.

It is a mistake that these animals are naturally bloodthirsty, vindictive and ferocious. No dogs that I know of are more gentle and affectionate than they are, and none more endearing in all their ways. They are exceedingly wise with it all, and may be talked to and reasoned with as one reasons with a child. So great is their sagacity, shown in every look and movement, that if one does get angry and talk cross to his bull-dog friend, he feels sorry the next minute for having done so.

For the points of this and all other household dogs I must refer the reader to books on the subject, but, as to colour, I may state the animal may be all white. I hardly like a patch-eyed dog: there

is something of the Bill Sykes about such a head—at least, so it seems to me. Red-smut or tar with black muzzle is better, or fawn-smut or yellow-smut; but a lovely brindle is my own particular choice.

Once more let me warn the reader against the abuse of the chain.

The Collie, rough or smooth, has much to recommend him as a household dog. This dog is universally admitted to be king of the canine race, so far as wisdom is concerned. He is almost too faithful; and it is a very great mistake to lay the charge of treachery at his door. This is a popular fallacy which it will take at least a hundred years to abuse the English mind of. If collies as house-dogs have a fault it lies in their excitability. The fact is, they need more exercise far than it is possible to give them in this country. The consequence is that when they are taken out for a run they often go "daft" with joy. Perhaps, too, it is but right to admit that some collies have a bad habit of chasing and barking at horses.

A Poodle if well-bred is a very knowing, wise, and amusing house-dog. He is nearly always a very great favourite with little folks, and there is really no end to the fun one can get out of the animal. He is a faithful pet too, and, although he may not be able to defend the house, he will assuredly give an alarm if anything be wrong. Poodles have often ere now alarmed master or mistress when fire broke out, and thus they have saved many valuable lives and much property.

There are one or two foreign dogs that may be recommended as house-dogs to any one who has a fancy for things odd. The Esquimaux dog, for example. Some of these are exceedingly faithful and excellent guards. They are very strong in the fore-quarters, and some friends of mine amuse themselves on the ice by getting their pets to tool them along. I am not aware that there is any law to prevent this.

Then there is the Australian dingo, that looks like a breed between a collie and wolf, but of course is nothing of the sort.

The Thibet dog is an animal of quite a different sort and character. He is not unlike an immense half-wild black or bronze Newfoundland. "He is bred," says a good, though old, authority, "on the tablelands of the Himalaya mountains bordering on Thibet. The Bhoteans, by whom many of them are carefully reared, come down to the low countries at certain seasons of the year to sell musk, etc. The women, however, remain at home, and they and their flocks are most sedulously guarded by these great dogs. They are also defenders of every considerable mansion in Thibet. Every writer who describes these dogs speaks of their noble size, ferocity, and antipathy to strangers."

An animal of this sort would make a splendid companion for a man in the backwoods of Canada, or wilds of our Scottish Highlands.

But what says the reader to our "new-fangled" friend the Schipperké (pronounced Skipperkey)? He is a recent importation from the Low Countries across the silver streak, but bound to become a very great favourite in Britain as time goes on. He has always been a utility dog, having served generations of boatmen on the Belgian canals as not only vermin-killer but watch-dog as well. No wonder they are called schipperkés or little captains. In England they have supplied a long-felt want. There was ample room for a little dog under or about twelve pounds weight, sharp as a house-dog, clean in build, without a long coat to sweep up the mud, healthy and hearty, not wheezy and subject to fits, or heir to ailments arising out of hereditary pampering and lap-nursing. The schipperké is a healthy pet dog. He forms a strong and undivided attachment to his owner, delighting in his company and pining when he is away. He is ever on the *qui vive*, and watches everything that goes on with an air of alertness that suspects everybody, and his great weakness is curiosity. Whatever he hears, sees, or feels, he must investigate and find out all about. The doggy is tailless, but, looking at his pert, amusing, coaxy face, you never miss the caudal appendage. He is all black and has a hard dense coat.

There is a dog called the Siberian wolf-hound, very large and beautiful; but hardly enough is known about him in this country to justify his recommendation as a house-dog.

Although I very greatly admire the character and keenness, not to say pert beauty, of the schipperké, I do not forget that there are quite a variety of small dogs in this country that make very excellent house-guards indeed. These, of course, are not meant to do anything else except sound an alarm. I have only to mention the black-and-tan terrier, the old English terrier, the Skye, the Dandie, the Yorkshire. These last are usually considered merely in the light of ladies' pets. Yet with all their extreme beauty they are very game, and if left in charge of anything will defend it with their little lives.

The Airdale terrier and Irish terrier are larger dogs, and these can fight as well as spring an alarm. The dogs that are little or no use as guards are—some sporting dogs, pugs, Maltese terriers, and lap-dogs generally. A retriever, however, is good in-doors or out.

So in England wherever we live we surely need not be afraid of thieves by day or burglars by night.

We have only to consider and choose and purchase. This purchasing is often looked upon as the most difficult part of dog-keeping. The tax is a mere trifle—seven shillings and sixpence for a dog of any size. It should be remembered that it is just as cheap keeping a well-bred and beautiful dog as a cur, and that mongrels are often bad-tempered and as full of faults as they often are of fleas. I have a poor opinion of that man who permits himself to board a dog of no pedigree.

Touching pedigree, we have to remember when purchasing that there is a stud-book, and that all really good dogs are registered therein. It is always easy, therefore, to verify a given pedigree, by sending it up to such journals as the "Stock Keeper," "The Live Stock Journal," etc. Forgery thus becomes impossible and is penal.

But *where* to purchase? Avoid replying to advertisements in cheap organs. I do not say many good dogs are not so advertised, but eight-tenths of them are trash, and if you are not a *connoisseur* you may go considerably to leeward of the thing you want. A plan I freqently recommend is to write to the secretary of some big show for a prize-list. You thus get the names and addresses of good breeders and winners at once. These may charge higher, but you are almost sure of getting a good dog.

The dog should be had on approval, and, before completing the purchase, it will be well to obtain the advice of some good vet. as to the state of its health. If a puppy —and it is best to buy about two or three months old—the skin should be clean and free from scurf or vermin—especially the latter. Puppies, like babies, change their skin, and this may give the puppy's coat a scaly look—but a vet. can distinguish between this and skin-complaint. The puppy ought to be as fat as a lamb and as frisky as a kitten, the limbs should be straight, teeth and eyes clear, and ears and tail correct.

Having got the little rascal, you must feed him well—*four or five times a day is not a bit too often.* Milk and bread and boiled Spratt cake must be the staple diet. But to tiny dogs you may give boiled eggs. I reared the Champion Newfoundland Grenville on boiled Spratt cake and good milk, and all dog-fanciers know what he is now. Bone-meal, cod-liver oil, and Parrish's chemical food (a syrup of the phosphates) are accessories for the growth of bone and general stamina.

It is a great mistake that all dogs must have distemper. I have never seen a case yet in my own kennels. It is prevented by careful feeding—especially about the time the dog is getting the permanent teeth, say from the fourth to seventh month —cleanliness, freedom from damp, warmth at night, and unlimited *exercise* and *food* all day. Big bones to gnaw help to pass the time, so do old boots and shoes to worry and play with; but small bones that he can swallow should on no account be given to a puppy.

A word or two about the training of the household dog. The owner himself should take this in hand. A puppy must not be scolded and talked at by every member of the family, including the servants. There is no surer method of making the poor fellow grow "bad," morally and physically. "The best trained dogs," says a recent writer, "are the most intelligent, and consequently the best looking, and any young dog with a heavy stupid expression may be vastly improved by a judicious course of training." This stands to reason. Indeed, there is as much difference between a dog like my Queen Bolina here and an ordinary street or stable loafing cur, as there is between a lady of culture and a charwoman.

"Proper training not only improves the dog but binds more closely the tie of affection 'twixt him and his master. Different dogs, of course, require different sorts of training, as the terrier for vermin and the Newfoundland for the sea."[1]

But what the householder requires is a dog that will be clean indoors, faithful and kind outside or in; if large, capable and willing to defend master or property, and if small, always on the alert and ready to give the alarm by day or night.

In training the dog one must have patience, and be gentle, firm, and kind. You must not attempt to rush a dog's education. The chief secret is to get the animal not only to love you—that is easy —but to believe that you love him. He will then take an interest in your every movement and strive to please you.

As to cleanliness in the house, when a dog forgets himself, show displeasure or grief in your face, shake the warning finger or the tiny cane, do not beat him, but turn him out at once.

Never thrash a dog at all if chastisement can be done without. Talk slowly and quietly to a dog when you want him to understand and obey a command. Dogs study one's face. They are splendid physiognomists. If, for example, you are sitting of an evening writing or reading in a quiet room and a footstep sounds outside on the gravel, the dog will raise his head and his eye seek yours, and I can assure you you can communicate your fears or suspicions far better by expression of face than words. You may, however, say in a low whisper, "Who is it, boy?" or "You had better watch!"

I have an idea that all animals, from a dog down to a parrot, soon know the meaning of the word "rascals." At night in the country, then, one may make plentiful use of the word on meeting, or hearing the footsteps of, any suspicious character. The dog will immediately be on the *qui vive*, and the dear fellow will be as happy as a king to think you trust him and put yourself under his protection.

Never correct a dog in anger, nor some time after he has done the offence, or his finite mind will be unable to form any connection 'twixt crime and penalty.

Remember in all your dealings with your dog that he *means* to do well, *means* to please you, and tries his best to do so. Only make him understand what you want.

Let me repeat that love is the bond that binds dog and master together, love and CANDOUR.

# "YANKEE DODGES."

## MACHINERY AND ENGINEERING.

THE American does all he can by machinery. If he has only a dozen articles to make he schemes a machine whereby they make themselves.

Handicraft is at a discount, brains at a premium. "We make dropped forgings and malleable castings," said an engineer one day to an inquirer, "but we don't make smiths."

Most of the elaborate carving in a Pullman car is done by machinery; miners rarely use a hand-drill, but one worked by steam or compressed air; farm-work on the immense fields of the West is, of course, all done by machinery.

The simplest processes, as well as the more elaborate ones mentioned above, are performed by a machine. For instance, every one knows, who has tried it, what an awkward piece of business it is to "shoot" or plane up the end of a plank, to make it straight and true across the grain.

You fix the thing upright in a vice and take the back corner off with a chisel to prevent the plane splitting it off; then slowly and laboriously you work the plane, stopping every two or three strokes to apply straightedge or square until the work is

satisfactory. In any American pattern or carpenter's shop there is a tool like a guillotine working horizontally; a true bed and a sharp vertical knife worked from above by a long handle. The workman places his piece of timber on the machine, sets the rest to any angle, gives one or two strokes with the handle, and has a true straight "glue joint" at once.

These machines are, of course, made and sold here, and in fact were introduced, I believe, by an Irish firm; but an English master-man needs much persuasion before he introduces one, while the American "goes for" it at once. If he could not buy one he would make one; there's the difference. It is in the *adoption* as well as in the invention of a machine that the American shines.

Jig saws, band saws, steam augers, countersinks, and screw-drivers, lathes with tools held in the back-centre, which is made to swivel so as to bore out taper if required, and all kinds of cutters for making spur-wheel patterns, are found in every *small* shop, and are not, as here, the exclusive servants of large concerns.

In iron-work also everything that can be done by machinery is done: stamped work is exquisite; gun-sights and the most delicate small forgings are made under a "drop" hammer. Flanging, drawing, welding, etc., are brought to great perfection, although, probably, the old country holds her own here. I was shown a cylinder, 15″ diam. and 8″ deep, with a top to it, all stamped out of one steel plate and untouched by hand. It was not an eighth of an inch thick, and the inventor of the process said he could have made it much deeper if required.

Electric welding is coming into extensive practical use, and appears to be a beautiful and satisfactory process. The two pieces of metal (not necessarily of the same kind) which it is desired to weld are placed in close juxtaposition by screw-holders, and an electric current of low electromotive force is passed through them. At the point of separation intense heat is generated which is sufficient to render the interior of the pieces almost fluid, while the outside remains comparatively cool; when hot enough the pieces are jammed together by the screws and the weld is made; it only remains to smooth off the slight burr raised at the junction. At present this process is chiefly used for light delicate work, for which it is admirably adapted.

No one who saw the working exhibition of the Waltham Watch Company at the London "Inventions" will deny the excellence of American machinery for light fine metal-work; but the same ingenuity and economy of labour are displayed in the heaviest iron-work. Carnegie's Rail Mills at Pittsburg, for example, are an admirable example of how to do work without touching it by hand.

The blooms, or rough bars of steel, are drawn from the furnaces, conveyed to the rolls, passed through them, cut to length and finished with a slight curve, so that as they cool they may straighten themselves; and all this by one or two men who stand on platforms and work hydraulic levers.

No man to haul up the furnace door when the "heat" is ready; no gang waiting about until the time comes for them to work the handle end of the great tongs and pull the bloom out. All is done quietly, and the doors, tongs, cranes, trollies, and rolls move as though endowed with intelligence.

Wire-drawing through rolls is an exceptionally difficult operation, because as the wire becomes thinner it of course also becomes longer, so that the speed of the last rolls has to be much greater than that of the first. This necessitates very careful gearing, as the least strain on the wire between two sets of rolls would stretch and probably break it. To guard against this it has been usual to allow the wire to make a bend between each pair of rolls, and a man stands in each bend to guide the wire round.

In Worcester, Mass., however, there is a mill in which the wire goes straight from one set of rolls to the next, and hundreds of yards of steel-wire are drawn from a bloom without being touched by hand.

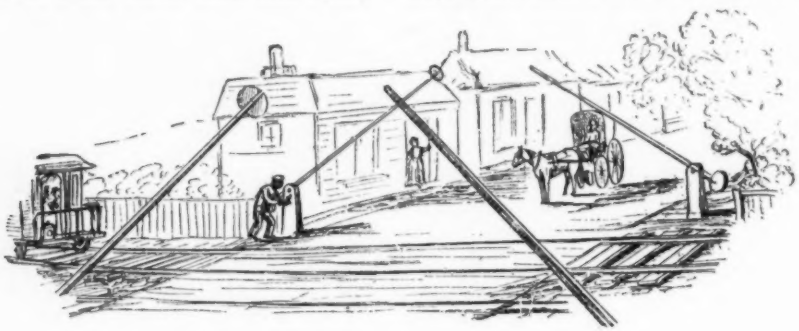
The first train of rolls which reduce the bloom to medium-sized rods of course do far more work in a given time than the later rolls, which have to deal with the wire in its lengthened condition; therefore to every set of first rolls there are arranged three or four sets of finishers, and the rods are delivered to each in turn by the instrumentality of a "switch."

Horse-nails are made out of solid cold square iron bar, which is passed down through rollers, cut into lengths, which have the heads formed on them, and finally pointed between dies.

Instances of clever machinery might be multiplied almost indefinitely, but many or most of them are now well known here.

American design in engineering has one striking feature, and that is its lightness. Machines are made light, for people prefer to "scrap" a machine and have another of a later pattern to possessing plant that is practically everlasting.

Bridges are also very light looking, and occasionally break down. The controversy between American and English schools of engineering is constantly raging, however, and need not be gone into here, except to say that the conditions in the two countries are entirely different, and that it is practically impossible to build a bridge strong enough to withstand a Johnstown flood or a Chicago avalanche.



The American has to build one strong enough to carry his trains and stand ordinary bad weather, and inclines to risk calamities. The distances also are so great that the railways, at first at any rate, have to be constructed in a quasi-temporary manner

Cast iron is used much more freely in the States than at home. A cast-iron locomotive driving-wheel with hollow spokes and a steel tire would frighten many English locomotive superintendents, though such wheels are common enough on the other side. Car wheels (all "bogey") are generally cast-iron with a chilled tread and no tire, and are ground up by emery wheels.

In places where ordinary cast-iron is inadmissible a "malleable" iron casting will be used, and only in the direst necessity does an American have recourse to a forging. The Lake Superior iron is said to be the best in the world for "malleable" work, and full advantage is taken of it. All gas-fittings—elbows, tees, etc.—are malleable castings, and most of the angle pieces, etc. used in car construction are the same. A visit to any American Novelty Store in London is enough to confirm these statements.

LOCOMOTIVES.

The American locomotive is a curious and "rattle-trappy"-*looking* contrivance, but there is a reason for all its seeming eccentricities. The huge spark-catcher on the funnel is required to

prevent forest fires; the severity of the climate produces a large and sumptuous "cab;" the length of the roads and their consequently unprotected state render the "cow-catcher" essential. The immense grate and fire-box are wanted on account of the poor coal, which is also answerable for the cinder accumulator or prolonged smoke-box. The gimcrack look of the "motion" is due to the fact that the Yankee fitter prefers to see the valve face he is surfacing to lying prone on his side between the cylinders, as in an English engine; therefore the valve chest is put above the cylinders and the spindle connected to the eccentrics by a rocking shaft. The outside connecting rod, which generally looks very light, is due to the well-founded American abhorrence of cranked axles; the immense polished bell and head lamp are concessions (and about the only ones) to public safety. The trains run along on the level through the stations, there being no platforms, so that the first care of a passenger on alighting from one train is not to step into the way of another.

Thus all the excrescences on the locomotive may be accounted for, and it must be borne in mind that very little is sacrificed to appearance. Machines are made to do their work on the

cheapest and simplest principles, irrespective of æsthetic proportions ; what is lacking in these is compensated for by brass bands and polish. Whatever be the faults of the American locomotive, it at least "gets there." Ten or twelve seventy-foot Pullman cars is no uncommon load for one engine running three hundred miles between sunset and sunrise, and over gradients and round curves which caused the eyes of an imported English driver to open considerably.

The railroads often run through the streets of a town, which echo to the "churchy" sound of the engine bells all day long.

Level crossings instead of bridges are universal, and these are generally protected by four swivel barriers which are lowered simultaneously across the roadway on the approach of a train. They are intended to serve the same purpose as the gates in use here, although there is nothing to prevent children or idiots running under them in front of an advancing train ; but all children there are about twenty-one years of age to begin with, and idiots —well, they are not wanted "anyhow."

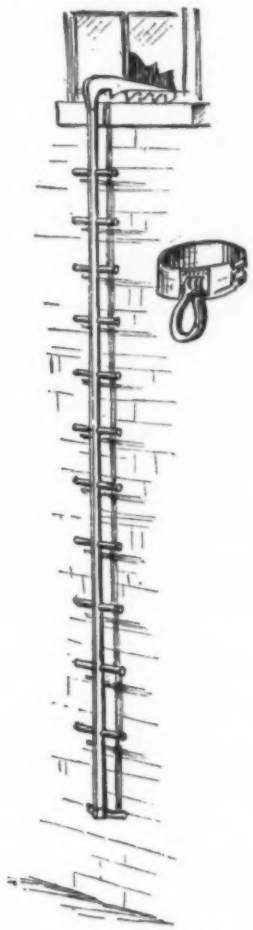
### THE FIRE BRIGADE.

There is one "dodge," or rather encyclopædia of "dodges," which, while it does not entirely come under the head of machinery or engineering, includes so much of both as to render mention in this connection admissible. It is the American Fire Brigade.

For efficiency and promptitude the New York Fire Brigade is probably unequalled in the world, and these qualities it owes quite as much to the ingenuity displayed in its apparatus as to the admirable discipline and training of its members.

For purposes of fire protection the whole city is divided into a number of sections, each of which contains from three to four fire-engines and two or three "hook and ladder" stations. Each station is under the command of a captain and lieutenant, and the whole section is under one chief, who has his headquarters at one or other of the stations, and rides to fires in his own gig, which is kept in readiness alongside the engines.

The crew of each station consists of ten men : one in turn is always on duty, one off duty and away altogether, and the other eight off duty but on the premises, ready night and day for action. Every man thus has every tenth day "off."



There is nothing special about the engines except that they are all steamers, and that the boilers are connected to a stove in the cellar which keeps the water in them boiling. On a "call" the connection to the heater is broken by a simple disengaging valve, the fire is lighted as the engine is moving out, and full steam pressure is obtained almost immediately.

The "hook and ladder" station contains a fearful-looking conveyance on four wheels, and about forty feet long. It carries fire escapes, hooks, and numberless other appliances, and the way in which it and its three horses abreast are driven at full speed through the rough, narrow, crowded and column-studded streets of New York is a marvel. The escape is pivoted on the fore end of the carriage and is raised by powerful screw-gearing to the vertical position ; the second continuing ladder may then be hoisted above it by chains and a winch.

The hook, which is part of the equipment, and gives its name to the station, is a very long-handled implement armed with a sharp iron tooth or hook, for tearing down ceilings or other overhead obstructions.

The carriage is packed full with scaling-ladders, leaping-nets, grappling-irons, "Siamese" unions for three or four streams of water, special hose-nozzles, crowbars, pitchforks, axes, etc. etc. All these devices are admirably designed, for they have to work, not deliberately and in the daylight, but at a moment's notice, in the dark, in a crowd, and under every conceivable disadvantage.

A scaling-ladder, with its accompanying belt, is shown in the sketch. The long iron-toothed projection at its upper end is pushed through a window or over a ledge, and the fireman, having put on the belt, ascends the hanging ladder. Arrived at the

top, he clips the ladder with the spring hook—made like a gigantic watch-chain staple—which hangs from the front of his belt, and then has both hands free to raise a second ladder, handed him by his mates below, up to the window on the next floor.

The spring hook or ring on the belt also serves as a pulley, by which a man can lower another to the street. To do this he sets his feet against the wall inside a window and takes a turn or two of the lowering rope through the ring.

Some of the special hose-nozzles are very ingenious. One is formed at the end of a long piece of bent iron pipe, and is intended to deliver water into a cellar from which smoke may be issuing in such dense clouds as to prevent the men getting close to it.

Another carries jets revolving in each direction, which are turned by the force of the stream, and make a perfect ball of water, which can be lowered into a cellar or thrust through a hole into the midst of the fire.

The most striking feature in the Brigade, however, is the rapidity with which an engine or ladder cart gets out of its house and away to the scene of action on receiving a call. This, again, is largely secured by the excellence of the mechanical "dodges."

To many a recital of the performance will be an oft-told tale, but since there is nothing like it on our side of the water it may be of interest.

The eight men off duty may be eating their dinner, or playing billiards, or sleeping soundly in their rooms above the engine-house; should the great gong below, which is connected electrically to the central station, sound and give the "first alarm," every man in that particular house, and in every fire-house in the city—for the "first alarm" is given them all round—leaves his dinner, his game, or his bed, and rushes to a hole in the floor, in the centre of which is a vertical brass rod. Grasping this he slides down like lightning into the engine-house, landing on a rubber mat placed there to lessen the shock.

Meantime, down below, the same current which sounded the gong has released the strap which holds each horse in his stall. The stalls are close alongside the engine, and the horses face towards the door. The instant they are released they clatter into their respective places on each side of the pole—being trained, of course, to do so—and await events.

Thus, in about one second after the "first alarm" the nine men are at their stations and the horses in their places. In nine cases out of ten the performance finishes here, for although the "first call" is given to every station in the city—with the object, presumably, of keeping things from rusting—the "second alarm" is only given to those stations in the vicinity of the fire.

Let us suppose that the station we are watching receives the "second alarm," which will come, if it come at all, immediately after the first. The collars, traces, and reins are all slung up to the roof by an arrangement of cords and pulleys. One man will release these and lower them on to the horses. Another man clips the collars, which are hinged, and puts in the bits. The cords release themselves automatically when the horses start.

The engineer cuts off his boiler-heating connection and puts a match to the fire. Another man opens the door, the crew swing up on to the engine, there to don their helmets, etc., kept there in readiness, and in six or seven seconds from the alarm the engine is tearing along the street.

If there be truth in the fireman's axiom, that the first half-minute at a fire is worth as much as the succeeding ten, American blazes should have small chance of developing into conflagrations.

With this crowning instance of Yankee "dodges" these papers may well close. Countless other still more clever contrivances in house and factory and machinery there doubtless are, but I prefer to describe only what I saw.

Only a few instances have been given, but they suffice to show one great characteristic of the American—the desire for speed.

He talks fast, walks fast, eats fast, thinks fast, travels fast. His very horse has a gaunt and restless appearance, disdains all such useless proceedings as arching of the mane or stepping high, and sweeps along with neck extended and hoofs just skimming the ground.

To be "slow" is the *bête noire* of the average Yankee, and "dead slow" is the most contemptuous epithet in his vocabulary.

With this craving for speed and the acuteness and ingenuity which it has developed, the American combines a readiness to impart information which is admirable, and an open-handed hospitality which must be experienced to be appreciated.

W. E. BUCK.

# THE DRAGON'S BREATH.

"YOU'D better hold your tongue just now, mate, unless you can trim it to a better fashion," said Jack Heronshawe, the headman at the "night-shift" at the Clapperston Iron Works. "Talk o' your sort don't go down well with th' maister." And he jerked his head towards a tall figure looming through the lurid light that crossed and recrossed the huge shed in bars and paths and patches of blood red.

"Th' maister—be it he?"

"Ay, and he's ears like a hare, as you'll likely find to your cost."

"I were saying no harm, Jack."

"No harm! Well, ye were cursing at a rate I'd rarely heard beat. You would appear to be a sort of prize-medal chap at cursing, Edwin Field. Perhaps ye reckon yourself on that question; perhaps ye take kind o' pride in piling up the big black words higher than the rest o' us can reach to. Is that so, Edwin Field?"

But the figure they had spoken of had come close up by this time, and Jack's question got no answer. Perhaps Edwin Field did not care to display his peculiar style of conversation so near to the "master" with ears like a hare, and who had a prejudice against cursing. He was a new hand at the Clapperston Iron Works, and was not very sure of his ground as yet.

Besides, a critical moment had come; a huge mass of molten iron was ready for "rolling," and there was no time for talk, good or bad.

The master, or rather the manager of the works, stood watching the scene. This rolling-work was a special feature at Clapperston, and all the care and skill of the place was centred in this shed, where the wheels and shafts and whirling bands drove the mass of iron down its appointed course, until what had been a shapeless incandescent thing—too bright to look upon, too blazing hot to approach—was stretched and cooled into a girder for an iron bridge, or a deck beam for some ocean steamer.

The men, defended by leathern garments soaked in water, "tended" the rolling-mill, seizing the iron with their long-handled pincers as it passed from side to side, and thrusting it again and again into the ever-narrowing grip of the machinery.

They were neither blinded, deafened, nor scorched, although any one not used to such fierce heat and glare would have deemed that rolling-shed a place fit only for such creatures as the gnomes of old legends or the demon genii of Arabian tales.

That particular beam of iron lay at last finished—a massive flawless bar; dark, inert, almost cold—wholly different from the white-hot lump that the machinery had first seized upon.

The men stood back; even they, seasoned muscular giants as they were, panted, and mopped their dripping foreheads.

"Terrible weighty bars, these," said Edwin Field, the new hand; and then he grumbled at the size of the Clapperston "rolls" in that awful vocabulary for which he was evidently famous.

"You believe in God, my man?" said a grave deep voice at his elbow.

He jumped as though he had been reached by one of those flakes of fiery rain that were falling from the furnace on the other side of the shed.

It was the manager. "You believe in God, Field?" he asked again.

"'Spose most on us do, sir," he answered awkwardly; "but why for should you ax me in particular?"

"You appealed to Him, and that earnestly. I also believe in Him, Field, but my strong belief keeps me from using His Name unless with respect, or allowing it so to be used here while I manage these works. God is our King, our Judge, our Great Father: we should be careful how we speak of Him."

No one replied. What was there to say? The "shift" was over, and the men going home; another gang of fresh hands were already gathering about the doors; there was some "puddling" to be done now, the rolling-mill was at rest for a space. Jack Heronshawe took his coat from a rusty nail in the "tea-house," Field and the rest followed to get their own belongings. To the men's astonishment, Mr. Lang, the manager, stepped in after them.

There was comparative quiet in the tea-house. Certainly the racket of the trucks rushing up the incline to feed the furnaces was tremendous, and the pounding of the forge-hammers unceasing, but still, to ears used to the din, the tea-house was a haven almost calm.

"Men," said Mr. Lang, "I've been wanting to speak to you all about this same habit of strong language; no time like the present, as the saying is, so here goes. I'm no preacher——"

"Nay, you're not," came in gruff chorus from some part of his audience.

"And I wish to dictate to no man's conscience; but this thing is open insult to One I serve, and as such I can't suffer it where I have any bit of authority. Do you see?"

"Mr. Lang, sir," spoke up Jack Heronshawe, "it's but a bit habit; we means no harm, no sort o' harm; the words just slips out and there's the end of them——"

"I'm not sure of that, Jack. In fact, I don't think there *is* the end by any means. But don't you be thinking I can't gauge the hold a habit has over a man; ay, and *this* habit, this devil-taught habit itself. There's not a man here—I *hope* theres not a man here—that has sinned as blackly as I have sinned with my blaspheming tongue."

(Was it fancy, or did his glance really rest on Edwin Field as he spoke?)

The men stared at him in silence. Their manager was not exactly a favourite with them; he was too strict, too unbending, to be very popular with a set of hard drinkers and wild livers such as were most of the Clapperston workmen; but they respected him, every mother's son of them; and to hear that he hoped there was not one amongst themselves as wicked as he had been was startling.

"I know the power of the habit, and the guilt of it; and I know the fight a man has to kick it out of himself," went on Mr. Lang. "See you here—I was a lad at the Huntwearsley Works. My father was a workman, a puddler, and so was I."

Again the men stared. A queer chap, this manager of theirs! Not often did a master confess to his own underlings how low his beginnings had been. What was he driving at? He was always odd and cold and sudden, but had he gone fairly off his head to-day, this Mr. Lang?

"Huntwearsley was a rough place in my day—well, yes, rougher even than Clapperston, and we know what Clapperston can do in the matter of roughness, some of us. But Huntwearsley was just God-forsaken, as the saying goes. But that word is *merely* a saying; God never forsakes any man or any place. *No, never!* Don't you believe it. Anyway, He didn't forsake me all those wild evil days when I was serving His enemy, the devil, as hard as a lad like me could serve. Jack!"

"Yes, sir."

"Would you care to hear, you and the rest? Would you care to know how I turned from the bad road to the pleasant path, from earning the wages of sin to trying to do some scrap of my dear Lord's work in these working days? It will take me ten minutes or more, and you're all needing home and your rest."

"You go ahead, sir, we're keen to hear."

Jack Heronshawe was over the others, it was for him to speak for the rest, for him to show manners, and humour the master by listening. Only Edwin Field shuffled a little nearer to the door, glancing uneasily round as if calculating whether he could possibly slip away unobserved.

But Mr. Lang spoke directly to him.

"Field, I should wish you to know my experience, and how fully I can understand *your* position, and gauge the big fight *you* will have if you determine to shake off the devil's chains and be God's freeman. I was about the foulest-mouthed boy that ever handled iron. I gloried in it, as the devil's slaves do sometimes glory in their shame. The men laughed at me and egged me on, and at length they too took a sort of pride in what I could say; and they'd tease me, or bribe me, or flatter me, on purpose to hear what horrible string of oaths I could get through without taking breath. God forgive me! . . .

"And then—well, I can't say much of *that*. . . . But I'd a little sister, a sweet white wee lass, just one of the lambs of God, such as the Saviour loved and lifted long ago. He loved *her*, that's plain, and He took her away from us—away from *me* that I might not smirch and soil her soul by my ill words and ways. But as they opened Heaven's gate to let her in, it seemed as though some bit of the Light fell through, right down into the blackness of my heart. I saw by the help of that Light what I'd never reckoned of before:—I saw that gentleness is stronger than fierceness, that truth must outlast lies, that God's way of clean unselfish living is the only life that can fit a man's needs. And I saw too that the only Poor Man who ever triumphed over vileness and spitefulness and death, who lives now after eighteen hundreds of years, is the Man Christ Jesus, who has given His word to help and save all who come to His Father in His Name.

"So I came. And He did help me.

"He helps me yet.

"There was an end of my cursing. I could not insult Him, for I loved Him well for all His Love to the child, and to me. The world seemed changed somehow, and the work too. Times were hard, and bread was dear, and my hours were long enough to make every bone of me ache most days; but the heart of me was light, and the labour did not daunt me as it had done.

"A fight? Well, yes, Field; the devil was not likely to give me up without trying to hold on. I almost thought afterwards in the fever that seized me that he and his friends had come bodily up from hell to worry me. Anyway they entered into the minds of my mates and put them up to try me hard.

"The men could not understand the change that had come over me: and like a lad I was foolish, and took no pains to stand aside so that the truth of God should show out to them rather than my own poor rags of goodness. They laughed at me at first; then they vowed I should be what I had been for so long, and that I should amuse and delight them by the immeasurable badness of my language. Come,' said they, 'round off for us, once at least. *Once at least*, or it will be worse for thee.'

"I tried to turn the bitter tide that was rising against me: I tried to please them by other things, to soften them, to pretend I thought their threats mere 'fun;' but it wouldn't do. Their blood had got up. Work their will I should, or——

"For that day I was safe, for something happened to call off their attention. And the next day, and the next, they *only* plagued and threatened. Then there came a Friday night, pay night. I remember it well, the last pay I drew for many a weary week. We were all standing about, and the big blasts were staining the cloudy sky blood-red above us: then one of them began at me. The old story—curse and swear I must and should! and the rest gathered round. I can see their faces now in that red glow; and their eyes, all full of cruel laughter.

"They clutched me. Would I reel off the old oaths? would I give up this uppish nonsense? Would I? No, I would not. Well then, they'd see who would conquer.

"They tied me to one of the stanchion-heads: I was but a slip of a lad, and it didn't take much roping to keep me fast. Then they all fell back from me, and I saw—I saw what they were going to do.

"I was but a yard or two from the doors of the great blast furnace. I heard the rattle of the lever chains. *They were going to open the doors on me.*

"You know, men, what that means.

"And so did I. I grew deadly sick, and was smitten with mortal fear. I unclosed my lips to cry out that I would give in, that I would say what they chose, do what they chose; I rolled my despairing eyes round on them—were they indeed devils sent by Satan to torture me?

"I know now they were men like myself, men Christ died for and loved; I know now that all the horror of that minute was measured and allowed by my Father in Heaven. I don't say I would go through it again—I don't think, strong man as I am, that I *could* go through it again; but I can look back and thank my Father that He asked and had from me such proof that I am in truth His child.

"He kept me safe in spite of my wild fear.

"The vast doors opened, and that intense tide of heat swept over me as the scorching breath of some devouring dragon. I felt it, and shivered and shrank, as a leaf shivers when one flings it on the fire-bars of the grate. I felt it, but I also felt that One was with me in that fiery ordeal. Long ago, when the half-mad angry king cast Shadrach, Meshech, and Abednego into the midst of his Babylonian furnace One stood by them there. And He, the Son of God, the Friend of men, stood now by me! . . .

"They shut to the doors again, and lifted me. I was senseless, and for many a day after I raved in agony, delirious with fever and with pain. Three or four of them were smitten to the heart at what they had done. They tended me, they brought their wages that I might have all that doctoring and nursing could do for me: they are my friends, my close-held friends to this hour. They serve my Master, they help me in my humble stand for His service and His glory. You don't know Huntwearsley Works? Ah, they're a different sort of place since; not only three or four but many a score of men have stood out as servants of the gentle King, and striven to work His will.

"It is many and many a year ago, and I have prospered well. I am here, set over you all to see that you do your duty. I am set here by the Clapperston Company, and have my duty to do to *them*. But I am sent here, too, by my Master Christ, the 'gentle King' of whom I spoke, and I have my duty to do to *Him*.

"Will you help me, one and all?

"Will you help me, John Heronshawe? Will you help me, Edwin Field? Will you help me to keep clean lips at least in these work-sheds: that Christ may not be openly insulted by 'Christian' men? I'd give a great deal. . . . I'd give all I have. . . . I'd give *my life* if you and the rest out there could believe what I believe, and hope what I hope. Some of you *must* surely be on my Lord's side? some of you *must* surely have His gentleness in your hearts? . . . Ah well, He knows. And He reigns. He will work out His will in His own good time."

The strong voice sank away almost in a sob. The reddened twilight stole through the grimy tea-house windows: did it show tears on the manager's eyelashes, and on more than one furrowed and toil-marked visage in that group of silent men?

There was a long pause. Then Jack Heronshawe spoke out; his voice was very faltering, and his words few and broken, but he knew what he meant to say, and he said it.

"Mr. Lang, sir, we *will* back you up. We mean to be decent men. And for myself, I know the truth. I've learned it all, times past, at Sunday school, and in my father's house,—a God-fearing house if ever there was one!—and I've a wife as is just a saint on earth. For myself, I'll try to stand on the right side from this day out. God help me!"

So spoke John Heronshawe: and as God had helped the manager, so God did help him.

It was not plain sailing at Clapperston for him or for Mr. Lang. There will always be a battle when good meets evil, when the hosts of God advance against the forces of darkness. But the right will win at last, for stronger is He that is for us than he that is against us.

And even Edwin Field is uneasy in the chains of his tyrant task-master; even Edwin Field is ashamed of the reckless life he leads; perhaps the day is not far off when even Edwin Field will see that the service of God is the only liberty.[1]

CRONA TEMPLE.

[1] The incident on which this sketch is based had its counterpart some years ago in the North of England, with a sadder result. We give the narrative as it reaches us, in the hope that it may stimulate working-men in these days of advancing privilege and education to do more towards purifying the public speech, which by all classes is degraded as much from senseless usage as from any other cause.—ED. L. H.

# HOW COMMODORE ANSON CAPTURED THE SPANISH GALLEON,

## AND BROUGHT THE SILVER TO LONDON.

ANSON IN 1744

IN the year 1739, when war between Great Britain and Spain seemed inevitable, it was planned that an expedition should be sent out to attack the Spanish settlements beyond the seas. Captain George Anson, then in command of the Centurion, 64, was designed as leader of the expedition. High expectations were raised in the country, and the seamen of the fleet rejoiced in the anticipation of adventure and of gain, as in old times, when rich prizes were taken and much booty obtained from the enemy's towns and forts within reach of the ships.

The plan was as a whole boldly conceived, and if it had been carried out promptly must have proved disastrous to Spain. But in the naval history of England there is no record more painful and humiliating than the actual mismanagement of this enterprise. The preparation of the ships was delayed so long that the Spaniards sent out a powerful fleet to watch the English movements, and had time to put their distant forts and coast defences into a condition for repelling attack. In England there was meanwhile the most shameful intriguing and jobbery as to the fitting and victualling the ships; and when ready for sea it was almost impossible to get sufficient seamen to man them, or soldiers for embarkation as land forces.

It was intended that Colonel Bland's regiment, as it was called, and three independent companies of a hundred men each, should be sent with the squadron. None of these were forthcoming, and, to the Commodore's vexation, all the forces placed at his disposal were 500 invalids, to be mustered from the out-pensioners of Chelsea College, a handful of marines, raw recruits who had never been to sea, and a number of released convicts. Sir Charles Wager, in command of the Pearl, 26-gun ship, joined the Commodore in making an indignant remonstrance. They were told that naval men could not judge of the efficiency of troops as military authorities could do. The fleet was therefore ordered to Portsmouth, there to fill up their complement of seamen, and to receive the land forces on board.

On arriving at Portsmouth the Admiral on the station, Sir John Norris, told Anson he could spare no men from his own ships. For the Centurion alone 300 additional able-bodied seamen were required, and instead of this only 170

were sent on board at Spithead, of whom 32 were from the hospital or sick quarter, about a hundred marines, and the remainder pressed-men, or prisoners from Salisbury. The other ships of the squadron, the Gloucester, the Severn, the Pearl, and the Wager, had the same bad treatment as to the shortness and inefficiency of their crews. The worst point of all was that on the 5th of August, when the 500 Chelsea pensioners were to come on board, there appeared only 250, most of them above sixty years of age, many above seventy, and few of the whole lot with health or vigour fit for such an expedition.

The last detachment of marines came on board on the 8th of August, and on the 10th the fleet sailed from Spithead for St. Helen's. This proved only the beginning of disappointments and delays. Contrary winds detained the ships long in the Channel, and they had to take charge of a large convoy of merchantmen, so that the Commodore did not get clear of the Channel till the last week of September.

The narrative of the "Voyage Round the World," compiled, from the ship's papers and his own observation, by Richard Walter, M.A., chaplain of the Centurion, gives details of all the events of the long voyage, extending over the greater part of five years, 1740–1744. It is a heavily-written book, but with matter so varied and novel that it was immensely popular on its publication. In 1756 it had reached an eighth edition, of which a copy is before us. Much of the narrative is useless now, containing records of the many cruises in southern seas and along the coasts of South America, without any decisive results. There are some chapters, however, of unfading interest, such as the account of Juan Fernandez, with many traces of the residence of Alexander Selkirk, who left the island about 30 years before Anson's visit; the condition of the South American colonies of Spain and of Portugal, Peru, Brazil, Mexico, and other regions, as they were in the middle of the eighteenth century; the Philippine Islands and their rich capital Manilla; Macao, Canton, and the coast of China, and the island of Formosa. On these and many other topics much curious information is found in Anson's Voyage Round the World."

The book also narrates the adventures of the other ships of the squadron—some of them wrecked, others despatched on various services, and at last all separated from the Centurion, which alone remained under the Commodore to carry out the objects of the expedition. The Gloucester, the largest ship after the Centurion, was broken up and burned. Out of 961 men who left England, after three years only 335 men and boys survived, not sufficient for the Commodore's ship alone. At the time of his great fight with the galleon he had little more than 200. To the Centurion we confine what we have yet to tell of the proceedings.

The crowning event of the whole expedition, and that which had kept up the spirits of the Commodore and his comrades through years of trial, vicissitude, and disappointment, was the capture of the famous Manilla ship that traded between the Philippine Islands and Acapulco on the coast of Mexico.

Floating rumours of this ship had long been current in England. Its capture had been the ambition of Anson throughout the whole of his voyages. On arriving in those remote seas he began to collect all the information he could obtain as to the trade of Manilla, and the time and course of the annual voyage of the renowned ship. He ascertained that Manilla was the great emporium of the trade of Eastern Asia, to which merchantmen from the isles of the Indian Sea, as well as from countries on the mainland, and also Chinese traders, brought their merchandise for conveyance to the New World.

Rare woods, spices, ornaments, and textile fabrics of every sort, especially silk goods, were brought to the Philippines and sent thence to America in the great ship, which returned laden with silver from Mexico. From China vast quantities of silk stuffs, including 50,000 pairs of silk stockings, were sent. Anson ascertained that the ship went only once in each year, and learned the usual time of arriving and departure. The last two years of his voyage he had mainly passed in preparation for intercepting the great Spanish ship. He kept out of sight as much as possible, often remaining a long time at Macao and near the Chinese coasts. In 1742 the Spaniards had heard of his purpose, and no ship came out that year. The next season he thought that two ships would probably sail with the accumulated freight, and his watchfulness was all the more keenly excited. As there was much intercourse between Macao and Manilla, he kept his purpose concealed in case of warnings reaching the Spaniards; but at last he put to sea on the final venture.

When he got quite clear of the Chinese coast he mustered all his people on the quarter-deck of the Centurion and announced to them his intention of intercepting the ships, for he expected this year there would be two of them, and encouraged them to exert themselves for such a prize. The Spanish vessels were said to be stout ships, with 44 guns apiece and numerous crews, but he trusted in the courage and skill of Englishmen to disregard any odds on such an occasion. He had only 227 hands on board all told, and the Spanish ships might have 500 men each, but he did not fear the result if he could come near them.

The speech of the Commodore was received with great joy, and the answer was given with three hearty cheers, after the manner of British sailors. All the perils and mishaps of the past were forgotten. The enthusiasm spread through the whole of the ship's crew. Much amusement was caused one day when the Commodore asked the butcher why he had lately seen no mutton at his table, and the butcher replied that he had only two sheep left, and, with the Commodore's leave, he proposed to keep them for the entertainment of the Spanish general.

During the weeks that passed in anxious waiting the Commodore caused the men to be exercised every day with working the great guns and in the use of their small arms. Rewards were

given for successful shooting, and most of the crew became expert marksmen.

At length the long-expected event took place. The story must be told in the words of the chaplain, as an eye-witness and the narrator of the fight.

On the 20th of June O.S., being just a month after their gaining their station, they were relieved out of this state of uncertainty; for at sunrise they discovered a sail from the masthead in the S.E. quarter. On this a general joy spread through the whole ship, for they had no doubt but this was one of the galeons, and they expected soon to descry the other. The Commodore instantly stood towards her, and at half an hour after seven they were near enough to see her from the Centurion's deck, at which time the galeon fired a gun and took in her topgallant sails. This was supposed to be a signal to her consort to hasten her up, and therefore the Centurion fired a gun to leeward to amuse her. The Commodore was surprised to find that during all this interval the galeon did not change her course, but continued to bear down upon him; for he hardly believed, what afterwards appeared to be the case, that she knew his ship to be the Centurion, and resolved to fight him.

About noon the Commodore was little more than a league distant from the galeon, and could fetch her wake, so that she could not now escape; and no second ship appearing it was concluded that she had been separated from her consort. Soon after the galeon haled up her foresail and brought to under topsails, with her head to the northward, hoisting Spanish colours and having the standard of Spain flying at the topgallant masthead. Mr. Anson in the meantime had prepared all things for an engagement on board the Centurion, and had taken every possible measure, both for the most effectual exertion of his small strength and for the avoiding the confusion and tumult too frequent in actions of this kind. He picked out about thirty of his choicest hands and best marksmen, whom he distributed into his tops, and who fully answered his expectation by the signal services they performed. As he had not hands enough remaining to quarter a sufficient number to each great gun in the customary manner, he therefore on his lower tier fixed only two men to each gun, who were to be solely employed in loading it, whilst the rest of his people were divided into different gangs of ten or twelve men each, who were continually moving about the decks to run out and fire such guns as were loaded. By this management he was enabled to make use of all his guns, and instead of whole broadsides with intervals between them, he kept up a constant fire without intermission, whence he doubted not to procure very signal advantages. For it is common with the Spaniards to fall down upon the decks when they see a broadside preparing, and to continue in that posture till it is given; after which they rise again and, presuming the danger to be for some time over, work their guns and fire with great briskness till another broadside is ready; but the firing gun by gun in the manner directed by the Commodore rendered this practice of theirs impossible.

The Centurion being thus prepared, and nearing the galeon apace, there happened a little after noon several squalls of wind and rain, which often obscured the galeon from their sight; but whenever it cleared up they observed her resolutely lying to. Towards one o'clock the Centurion hoisted her broad pendant and colours, she being then within gunshot of the enemy, and the Commodore perceiving the Spaniards to have neglected clearing their ship till that time, as he saw them throwing overboard cattle and lumber, he gave orders to fire upon them with the chace-guns to disturb them in their work and prevent them from compleating it, though his general directions had been not to engage before they were within pistol-shot. The galeon returned the fire with two of her stern-chace; and the Centurion getting her sprit-sail-yard fore and aft, that if necessary she might be ready for boarding, the Spaniards in a bravado rigged their sprit-sail-yard fore and aft likewise. Soon after the Centurion came abreast of the enemy within pistol-shot, keeping to the leeward of them with a view of preventing their putting before the wind and gaining the port of Jalapay from which they were about seven leagues distant.

And now the engagement began in earnest, and for the first half hour Mr. Anson over-reached the galeon and lay on her bow, where by the great wideness of his ports he could traverse almost all his guns upon the enemy, whilst the galeon could only bring a part of hers to bear. Immediately on the commencement of the action the mats with which the galeon had stuffed her netting took fire and burnt violently, blazing up half as high as the mizen-top. This accident, supposed to be caused by the Centurion's wads, threw the enemy into the utmost terror, and also alarmed the Commodore, for he feared lest the galeon should be burnt, and lest he himself too might suffer by her driving on board him. However, the Spaniards at last freed themselves from the fire by cutting away the netting and tumbling the whole mass which was in flames into the sea. All this interval the Centurion kept her first advantageous position, firing her cannon with great regularity and briskness; whilst at the same time the galeon's decks lay open to her topmen, who, having at their first volley driven the Spaniards from their tops, made prodigious havoc with their small arms, killing or wounding every officer but one that appeared on the quarter-deck, and wounding in particular the general of the galeon himself.

Thus the action proceeded for at least half an hour; but then the Centurion lost the superiority arising from her original situation, and was close alongside the galeon, and the enemy continued to fire briskly for near an hour longer; yet even in this posture the Commodore's grape-shot swept their decks so effectually, and the number of their slain and wounded became so considerable, that they began to fall into great disorder, especially as the general, who was the life of the action, was no longer capable of exerting himself. Their confusion was visible from on board the Commodore's ship, for they were so near that some of the Spanish officers were seen running about with much assiduity to prevent the desertion of their men from their quarters. But all their endeavours were in vain, for after having as a last effort fired five or six guns with more judgment than usual, they yielded up the contest, and the galeon's colours being singed off the ensign staff in the beginning of the engagement, she struck the standard at her maintop-gallant masthead, the person who was employed to perform this office having been in imminent peril of being killed had not the Commodore, who perceived what he was about, given express orders to his people to desist from firing.

Thus was the Centurion possessed of this rich prize, amounting in value to near a million and a half of dollars. She was called the Nostra Signora de Cabadonga, and was commanded by General Don Jeronimo de Mentero, a Portuguese, who was the most approved officer for skill and courage of any employed in that service. The galeon was much larger than the Centurion, and had five hundred and fifty men and thirty-six guns mounted for action, besides twenty-eight pedreroes in her gunwale, quarters, and tops, each of which carried a four-pound ball. She was very well furnished with small arms, and was particularly provided against boarding, both by her close quarters and by a strong net-work of two-inch rope, which was laced over her waist and was defended by half-pikes. She had sixty-seven killed in the action, and eighty-four wounded, whilst the Centurion had only two killed and a lieutenant and sixteen wounded, all of whom but one recovered, of so little consequence are the most destructive arms in untutored and unpractised hands.

The treasure thus taken by the Centurion having been for at least eighteen months the great object of their hopes, it is impossible to describe the transport on board when after all their reiterated disappointments they at last saw their wishes accomplished. But their joy was near being suddenly damped by a most tremendous incident; for no sooner had the galeon struck than one of the lieutenants, coming to Mr. Anson to congratulate him on his prize, whispered him at the same time that the Centurion was dangerously on fire near the powder-room. The Commodore received this dreadful news without any apparent emotion, and taking care not to alarm his people, gave the necessary orders for extinguishing the fire, which was happily done in a short time, though its appearance at first was extremely terrible.

The Commodore appointed the Manila vessel to be a post ship in his Majesty's service, and gave the command of her to Mr. Saumarez, his first-lieutenant, who before night sent on board the Centurion all the Spanish prisoners except such as were thought the most proper to be retained to

assist in navigating the galeon. And now the Commodore learnt from some of these prisoners that the other ship, which he had kept in the port of Acapulco the preceding year, instead of returning in company with the present prize, as was expected, had set sail from Acapulco alone much sooner than usual, and had, in all probability, got into the port of Manila long before the Centurion arrived off Cape Espiritu Santo; so that Mr. Anson, notwithstanding his present success, had great reason to regret his loss of time at Macao, which prevented him from taking two rich prizes instead of one.

The Commodore, when the action was ended, resolved to make the best of his way with his prize for the river of Canton, being the mean time fully employed in securing his prisoners, and in removing the treasure from on board the galeon into the Centurion.

The Commodore's anxiety was not over when the treasure was secured. He had to make the most careful arrangements for the custody of the prisoners, who far outnumbered his own men. The officers, 17 in number, were lodged in the first-lieutenant's cabin, and the general in the captain's cabin, always with sentinels on the watch, while the Spanish soldiers and seamen were kept in the holds of the Centurion and the prize ship, with guns pointed at the hatchways and air-holes, and guards with loaded muskets always ready to fire into the hold in case of any attempt at disturbance. The poor fellows all reached Canton in safety, except a few who had been seriously wounded. Being on short allowance both of food and water, they presented a very haggard and spectral appearance at the end of the voyage.

On examining the cargo of the prize it was found that she had on board 1,313,843 pieces of eight, and 35,682 ounces of virgin silver, with some cochineal and other commodities, of small account compared with the specie.

If we reckon the plunder taken in previous events of the voyage, especially at the capture of Paito, the port of Lima, and the destruction of Spanish property, the damage done to the enemy probably exceeded a million sterling. To this must be added the cost to Spain of fitting out the vessels sent to watch Anson, and other charges in fortification and defence in the places liable to attack.

The Chinese were greatly astonished at the capture of the Spanish ship and the defeat of the troops by a force so greatly inferior. They were still more astonished at the humane treatment of the prisoners, as they would themselves doubtless have put them to torture and death. Great fame came to the Commodore, who with his officers was honoured and fêted by the Chinese Viceroy and other authorities. The prisoners were sent away in Chinese junks hired for the purpose, and in due time Anson set out on his return to England.

The homeward voyage was not all plain sailing. There were storms to encounter, and a sharp look-out had to be kept for Spanish war-cruisers. The most critical time of all was in approaching the Channel, for by this time there was war with France as well as Spain, and there were French ships in the Channel. Under cover of an opportune fog this last peril was escaped, and Anson brought the Centurion safely into Portsmouth Harbour.

The Spanish prize had been sold to Chinese merchants at Canton on December 15, 1743, Anson sailing the same day for England. The Centurion passed the Straits of Sunda early in January, anchored in Table Bay at the Cape of Good Hope on March 11, on April 19 sighted St. Helena, on June 12 got sight of the Lizard, and on the evening of the 15th came safe to anchor at Spithead.

The public triumph was when the treasure was brought to London. Thirty waggons laden with the silver were drawn through the streets to the Tower, the ship's company heading the procession with colours flying, and band playing with escort of troops, and vast crowds lining the way. The distribution of the booty made all the survivors comparatively rich, or at least compensated them for their privations.

The Government did not behave well to the Commodore, but on a change of Ministry he was made a Lord of the Admiralty by the Duke of Bedford. He subsequently rose to be Rear-Admiral, and finally Admiral of the Fleet. For his services against the French during the war he received a peerage. He died, full of honour, in 1762. Many of the naval commanders of later years—Saumarez, Brett, Keppel, Hyde-Parker, and others—were trained by Anson, and had served with him in the Centurion. His exploits occupy a large space in naval annals, but his name will be chiefly memorable in history for his "Voyage Round the World" and the "Capture of the Manilla Galleon."[1]

[1] The story of his life is given in a book entitled "From Middy to Admiral of the Fleet," by Dr. Macaulay (Hutchinson & Co.). The portrait at the head of this article was taken in 1744, as Commodore, on his return from his South Sea expedition. His portrait was painted again, as Admiral, by Sir Joshua Reynolds.

# Varieties.

### H.M.S. Serpent.

The loss of H.M.S. "Serpent" on the Spanish coast is still fresh in the public memory. The following letter, relating to the burial of the bodies recovered, reaches us from the British Consulate at Coruña:—

"The funeral service in memory of the officers and sailors lost in H.M.S. 'Serpent' was held at Puente de Buey. The commander of H.M.S. 'Lapwing,' also my husband, wished us, my children and me, to be present. Naturally our hearts had been stirred to their depths by the terrible catastrophe. We had collected ivy, ferns, etc., to make a cross and wreaths, and had secured from a garden near Coruña some white roses; these were sent on board the 'Lapwing.'

"We arrived in Camariñas on Saturday, the day before the ceremony was to take place; rooms had been prepared for us in Camariñas itself, a poverty-stricken little town.

"The following morning we were roused by the tramp of sailors and marines, and the firing of twenty-one guns from the 'Lapwing,' and the passing of carts carrying arms and uniforms. At ten the commander called for our party; we rode on mules and horses to the scene of the wreck, through the wildest and most desolate looking country, no roads, our animals stumbling over boulders, crossing a sandy beach, climbing a mountainous path, then for a while on a tolerably smooth level near the sea.

"After a ride of about two hours we reached our destination. We then walked to the cemetery, which had been inclosed, but as many more bodies were washed on shore, it was decided to enlarge the ground and consecrate two plots. Strange to say, the morning of the funeral service a large portion of the wreck appeared, also thirty bodies—the largest number washed up at a time. The officers and my husband, having donned their uniforms, found temporary shelter behind a huge boulder. The bugle sounded for falling-in. Just then the Spanish commander, McMahon, of the gun-boat 'Mendez-Nunez,' and his men, appeared on the scene with the captain of the port of Camariñas, and the mayor. All were drawn up with military precision, awaiting the arrival of the priest, who punctually at two arrived at the cemetery, dressed in his robes. Then followed the consecration of both grounds, after which the Spanish sailors fired three volleys. Our commander ordered his party into the inclosed spot, the crowd—which was immense, from all parts of the surrounding neighbourhood—respectfully making way.

"Then followed our funeral service read by the commander, in a clear impressive voice. How solemn it was! The burial ground close by the sea, with its always agitated waves at this spot—the wreck showing—the newly made mounds: what wonder that our very souls were touched! Our little son dressed in his sailor's suit stood to the left of the commander and joined in the responses, his face white with emotion.

"After the service our sailors fired three volleys, and the 'Lapwing' responded with twenty-one guns. Wreaths were then placed on the cross, one being presented by the Spanish commander in the name of the Spanish navy; this consisted of a coronet of flowers decorated with black ribbon embroidered with gold letters, 'The Spanish navy present this in token of sympathy with the English navy on their loss.'

"Evening was now drawing on, and we prepared for our return. Any one unaccustomed to a Spanish saddle finds it most difficult to keep on, especially a woman: *we* mount on the *left* side, the saddle itself is nothing but a pile of cloth strapped on, a stirrup hangs loosely down, the bridle generally consists of one piece of rope attached to the bit on one side only. My girls and I preferred to ride with our feet free, *ready* to fall; two girls did come off unhurt, while one met with what might have been a serious accident: the mule falling, the trappings of the saddle giving way at the same time, threw her with some violence against a stone wall. We were all glad to reach Camariñas and rest.

"The following day the Romish 'Requiem Mass' took place in the parish church at Camariñas, to which we were all invited. Seats were provided for us on either side of the altar. The service was a long, mournful, and tedious one, but there was something pathetic in all the arrangements. The masses were paid for by subscription, the very poorest inhabitant giving his or her mite; there was intense devoutness in the attitudes and expressions of the worshippers. The church was cold and damp. Near the altar stood a catafalque covered with a black cloth, at the corners the designs of death's heads and cross-bones. The service consisted of the Romish prayers for the dead, the sprinkling of the catafalque, the tolling of bells, etc.—a most weird ceremony it seemed to us; it lasted two hours and a half, and I never remember feeling more glad to get into the fresh air. Yet I repeat there was something intensely pathetic in the whole service.

"We prolonged our stay a few days in Camariñas, again visiting the scene of the wreck, where the first lieutenant and a party of men remained encamped, working at favourable tides in order to secure the torpedoes discovered in it; we were told our visits animated the men in that lonely, dreary spot.

"I think we shall all have a warm place in our memories for Camariñas, the people were so kindly and sympathetic. It was a little trying at first to be followed about everywhere by a crowd, but they were not rude, the children often giving us wild flowers. English women are a novelty down there, and it greatly pleased the simple folk when we turned round and chatted with them. Mothers thought from my boy's dress and ribbon that he was a sailor on board the 'Lapwing', and loudly pitied the little fellow. Many times and oft explanations were given. Many were the kind farewells, the authorities coming to see us off. And so we left Camariñas, its neighbourhood sacred now to the hearts of many English men and women.

"LOUISA M. RAWSON WALKER."

**Inventor of the Steamboat.**—There are many disputes as to who is really entitled to be called the "inventor" of steamboats. American as well as English claims are maintained. In Scotland there seems no debate on the subject. Recently a marble bust of William Symington was unveiled in the west wing of the Museum of Science and Art, Edinburgh, by Professor Sir William Thomson, Glasgow. In the course of some remarks, Sir William said that Symington was the real discoverer and the practical originator of the steamboat. It was interesting to note that Symington exhibited before the professors of Edinburgh University a model of a carriage to be moved on the public roads by the power of steam. In 1803 Symington constructed a steamer which took in tow two laden sloops, each seventy tons burthen, on the Forth and Clyde Canal. Provost Macpherson, Grangemouth, said that it was claimed that at Grangemouth the first practical steamer was built, and her engines were made at the famous Carron Ironworks. The unveiling of the bust took place amidst loud cheering. Sir R. Murdoch Smith, on behalf of the museum authorities, accepted the custody of the bust. Amongst those present at the ceremony was Mrs. Dickie, Glasgow, a granddaughter of Symington. The bust is by D. W. Stevenson, R.S.A.

**Wrecks in Chinese Seas.**—The terrible calamity of the loss of the Turkish ship "Ertogrul," having on board a large number of cadets of high families (as was the case when our "Captain" foundered), has caused discussion as to faults of naval construction, as well as to the dangers of the Chinese waters. A writer in the "Times" said that "The loss of H.M.S. 'Wasp' in 1887, in the China seas, was due to glaring faults of construction." This is a very unfair as well as untrue statement. A communication from the Admiralty affirms that the "Wasp" was pre-eminently safe as a sea-going vessel, and that three sister gun-boats, built from the same design, have been highly reported on as the result of actual service. The truth is that the China coasts are extremely perilous, and insufficiently surveyed, with few trustworthy charts, and insufficient beacons and lighthouses.

**London Fogs.**—The regular London fogs, dense and dark with carbonaceous and sulphurous products, do not dissolve and disperse gradually, as white vapourous mists and fogs do, but are borne far off by the currents of air. In December, 1890, when the winds were for a long period easterly, the London fog, unmistakable both in colour and odour, was injuriously felt, and disfiguringly deposited in various places in Berkshire and Oxfordshire. Mr. Martin Sutton of Reading, and Mr. Stephen Darly of Cookham Dean, near Maidenhead, reported the arrival of the dingy clouds of fog in these localities.

**St. Martin's-le-Grand Sanctuary.**—In olden times there were many places in London with the privilege of affording refuge to criminals, or of persons liable to prosecution by law. One of these was in the parish of St. Martin's-le-Grand, on the site of the present Post Office. A curious incident occurred here in 1439. A soldier was being taken by the Sheriff from Newgate to Guildhall for trial. In passing Panyer Alley, between Newgate Street and Paternoster Row, five men rushed out suddenly, and took the man to St. Martin's Sanctuary, close at hand. The Sheriff and his guards were incautious enough to follow them into the church, seize them, and take them to Newgate Prison. The judges and magistrates, however, soon compelled the Sheriff to release the prisoners, and replace them in the Sanctuary, for which they would watch their own opportunity to escape.

**Paupers in England.**—Dr. J. M. Rhodes read at the last meeting of the British Association a paper on pauperism, which gave rise to an animated discussion. Few people are aware of the amount of pauperism still burdening the country. There are paupers enough, supported by rates, to form a procession four deep over a hundred miles in length. Fortunately, the numbers are diminishing. In 1834 there could not be less than 2,000,000, while now they are under 800,000. In 1832 the sum expended was £7,000,000, or ten shillings per head of population, while in 1888, with double the population, the sum expended was £8,400,820, at less than six shillings per head. The increase of coal-mining and other industrial work has chiefly been effective in keeping down pauperism. Alcoholism is a huge feeder of pauperism, along with idleness and vice in every form.

**Future Wars.**—Sir Frederick Abel, in his Address as President of the British Association, after describing the extraordinary improvements in the military resources of European nations, thus spoke of the probable influence of these appliances in future wars. "The conditions under which engagements by sea or land will in future be fought have certainly become greatly modified from those of thirty-five years ago, and the duration of warfare, even between nations in conflict who are on a fair equality of resources, must become reduced; but, as regards the results of a trial of strength between contending forces similarly equipped, as they now will be, with the latest of modern appliances only varying in detail, these must after all depend, as of old, partly upon accident, favoured perhaps by a temporary superiority in equipment, partly upon the skill and military genius of individuals, and very much upon the characteristics of the men who fight the battles."

**German Chivalry.**—During the Franco-German war the country round Domrémy, the birth-place of Joan d'Arc, was in possession of the Prussians. The German regiments always presented arms in passing the house reputed to be that in which the heroic Maid of Orleans was born. It is the custom for French troops to beat the drum in marching past the place.

**The Columbus Celebration.**—Several Governments having been consulted as to the celebration of the fourth centenary of Columbus's departure "in search of the new world," the Madrid Government, at the request of the American Congress, has fixed upon Huelva as its place of celebration, this being the estuary (now known as Huelva Harbour) from which the great discoverer sailed. The meetings will be held at the Convent of La Rabida, which sheltered Columbus when he was about to abandon his project in despair, and the prior of which secured for him that royal aid which he had himself failed to obtain. It is expected that the great celebration is to be at Chicago, where preparations are making for "the biggest world's show" ever known.

**Tax-eaters in America.**—Among the returns of the census are tables of taxes in various States and cities. The costs of government are indicated, and it appears that, while ten dollars per head serves for municipal government in Philadelphia, the more corrupt government of New York City requires fifteen dollars. It is stated that on the pay-rolls of New York, there are at least 12,000 persons getting on the average 1,000 dollars apiece! With such an army of tax-eaters, and with scandalous misgovernment and jobbery, no wonder that the "politicians" make strong fight for place and power. The taxes are excessive, the waste great, and the respectable citizens, in the minority, grumble but pay.

**New South Wales.**—During the five years of the governorship of Lord Carington, this senior Australian colony has increased in population by two hundred thousand, the revenue receipts by nearly two millions, the value of sea-borne trade by six millions, the shipping tonnage by over a million tons. New South Wales has now some 2,300 miles of railway yielding a net revenue of a million sterling, and not far short of a million and a quarter of acres under crop. Since 1885 the sheep stock has increased from thirty-seven to fifty millions; and in eighteen months following a long drought the numbers "jumped" eleven millions.

**Artificial Rubies.**—Since the days of the alchemists, who vainly tried to transmute baser metals into gold, many experiments have been made for the production of other precious natural objects by chemistry. More successful than the efforts to crystallise carbon into diamonds, is the method of making rubies, as described by two French chemists, MM. Fremy and Verneuil, in papers communicated to the Académie des Sciences. Alumina, which is the chemical basis of rubies, is subjected for a long period to intense heat in crucibles, retained for several weeks in huge gas furnaces. By using chromated alumina, alkalized with carbonate of potash, beautiful colours of varied hue appear in the crystals, which are as large as any rubies found in natural condition. It is said that the hardness of the artificial crystals is extreme, and if this is confirmed by experts, the new product will be much used by watchmakers and other artificers as well as for ornamental jewellery. So far as mere appearance goes, there are few precious stones which cannot be manufactured and set so as to vie with natural gems in beauty and brilliancy.

**The Tallest German Soldier.**—A correspondent writes:—"Until quite lately Captain Plüskow, of the first regiment of Guards, had been considered the biggest man in the German army. He measured over 8oin. in height. But a short time since a young Rhinelander joined the first regiment of Foot Guards as a 'One year's volunteer,' who attains the colossal height of over 7ft. 4½in. Since 1850 the first regiment of Guards has not had so tall a man. At that time they had a man who was so tall that everything, even his bedstead, had to be made specially for him. His accoutrements are preserved still among the *curios* of the regiment. He died of consumption during his term of service."

In the volume of the "Leisure Hour" for 1875 there is a story, "The Tall Man," by Gustav Nieritz, translated by Mrs. Alexander Kerr, founded on the adventures of one of the giant grenadiers of King Frederick William I. of Prussia.

**Happiness in Humble Life.**—Mr. Jay, of Bath, himself once a cottage boy, has described the happiness of humble rural life, when illumined and sanctified by piety. "Take a peasant, or a mechanic," he says, "in a village, sober, moral, religious, his wishes bounded by the simplicity of rural life, his sleep sweet, his meals, though plain, sauced with appetite, his hands sufficient for him, his labour limited and free from distracting care, his little garden yielding him the useful vegetable and the Sunday flower, the Sabbath a day of pleasing change, rest, and refreshment of spirit, the going to the house of God in company, and the Bible now more amply read, though not forgotten during the week,—take such a one, and his position as to enjoyment will not shrink from comparison with the state of thousands, who never look down upon him but with contempt, pity, or indifference."

**Niagara Falls Receding.**—The official engineer of the State of New York has made a new survey of the country adjoining the Falls of Niagara. The report gives details of the recession of the Falls since 1742, when the first survey was made. The total mean recession of the Horse Shoe Falls since that time has been 104 feet 6 inches; the maximum recession at one point is 270 feet. Of what was known as the American Falls the mean recession is only 30 feet 6 inches. The length of the crest has increased from 2,260 feet to 3,010 feet, by the wasting away of the embankment. The total area of recession of the American Falls is 32,900 square feet; of the Horse Shoe Falls 275,400 feet. The earliest picture of the Falls is the frontispiece of "Falk Hennepin's Travels," published in 1678. A copy of the English translation is in the British Museum. An account of it appeared in the "Leisure Hour" for 1871.

**Dinners without Wine.**—In American homes, far more than in England, it is the custom to have dinner without wine. A new fashion has been introduced, not in New York so much as in truly American cities, of affixing a tiny bow of blue ribbon on one of the lower corners of the note-paper or card of invitation. This leaves each guest to decline the invitation if he is unequal to the required self-denial for one evening, while at the same time any one who is struggling against the temptation of drink will understand that he is exposed to no risk in accepting the offered social pleasure —"the feast of reason and the flow of soul."

**Centenarian Soldiers.**—On the occasion of the recent death of Admiral Zambelli, upwards of 100 years of age, Vienna papers spoke of him as the oldest warrior in Europe. The Turkish general, Achmet Pasha, reports that in the number of veteran pensioners in the service of the Sultan there are three soldiers whose combined ages are above 330. The oldest is said to be 112, born in 1778. We suspect that registers of births are not very strictly kept in Turkey.

**Mr. C. E. Mudie and Carlyle.**—The late Mr. Mudie was at a brilliant reception given by Lady Ashburton. It was soon after the time when there had been complaints in the newspapers of the exclusion of certain objectionable books from "Mudie's Library." During the evening he was near Thomas Carlyle, who at once singled him out, and looking him full in the face, said in his brusquest manner and broadest Doric, "So you're the man that takes upon you to divide the sheep from the goats! Ah, it's an awfu' thing to judge a man. It's a more awfu' thing to judge a book, for a book has a life beyond a man." Mr. Mudie, when thus attacked as a literary and ethical censor, held his ground boldly enough, and said, "In my business I profess to judge books only from a commercial standpoint, though it is ever my object to circulate good books and not bad books." Mr. Mudie was attacked violently by the lower order of authors as well as readers, but he was perfectly justified in doing as he thought right, the Library being at that time wholly a private and personal property. It is said that the annoyance caused by disputes as to tastes and proprieties in the books ordered helped Mr. Mudie's decision to form his business into a company, so that the responsibility might not be his alone. He was a high-minded and honourable as well as a shrewd business man. He himself had no little talent as an author, as his volume of poems, privately printed, attests. At his funeral the beautiful hymn was sung, "I lift my heart to Thee," one of his own composition.

**Stowe House.**—The celebrated mansion and estate of the Dukes of Buckingham has for a new tenant the head of the house of Orleans, the Comte de Paris. On the arrival of the Comte and Comtesse, with the Duc d'Orleans and the Princess Hélène, addresses were presented by the tenantry, and by the inhabitants of Buckingham and of Stowe. In replying to the latter address, the Comte de Paris, who had landed only the day before from his visit to the United States, where he had served as a volunteer in the Federal army during the Civil War, made graceful reference to the circumstances of his coming to the place. "My family and myself are deeply moved by the cordial reception we have experienced from the inhabitants of this ancient city. Having returned only yesterday from the New World, I expected to find myself among you a total stranger; but such cannot be the case in this hospitable land, and the courtesies extended a few weeks since to the Comtesse de Paris make me feel already at home here, although I hardly yet even know the historical and stately mansion in which we are taking up our temporary abode. We cannot replace, in his connexion with this town and neighbourhood, the noble Duke—that hard-working man whose loss you are still mourning. But the way in which you have reminded us of the friendship of the King, my grandfather, towards the English people, and of our cordial relations with your Royal Family, has established between us bonds which I trust will be strengthened every day. You know that it is a grateful appreciation of British hospitality which has brought the exiles again to your shores. It is the knowledge of the charm and the resources of English country life which has induced us to seek a residence in this delightful country. To whatever place we may be carried by our future destinies, we shall ever cherish grateful remembrance of our welcome to Stowe."

**Horses in Natal.**—Twenty-four years ago a cart-horse, properly so called, was scarcely ever seen in Natal. Now, in the towns, horses have almost elbowed out the slow and humble, but careful, ox. We have to thank road-hardening and railways for this change.—*Natal Mercury.*

**Feeding the Passengers of the Cunard Company.**—In the Life of Sir George Burns, Mr. E. Hodder says that the Cunard fleet of liners, which are ever on the Atlantic connecting the Old World and the New, require for their victualling in the course of a year, 4,656 sheep, 1,800 lambs, 2,474 oxen, 24,075 fowls, 4,230 ducks, 2,200 turkeys, 2,200 geese, 53 tons of ham, 20 tons of bacon, 15 tons of cheese, 831,603 eggs. Of minor things we have, "one ton and a half of mustard, one ton and three-quarters of pepper, 7,216 bottles of pickles, 8,000 tins of sardines, 30 tons of salt cod and ling, 4,192 four-pound jars of jam, 15 tons of marmalade, 22 tons of raisins, currants and figs, 18 tons of split peas, 15 tons of pearl barley, 17 tons of rice, 34 tons of oatmeal, 460 tons of flour, 23 tons of biscuits, 33 tons of salt, 48,902 loaves of bread of 8 lbs. each." The consumption of wines, mineral waters, etc., is on a corresponding scale—over 15,000 bottles altogether for a single voyage. The continuous and extensive breakage of glass and earthenware is also another feature of life on the sea which should not be overlooked. Thus the loss under this head attains to an average of something like this for every voyage: "900 plates, 280 cups, 438 saucers, 1,113 tumblers, 200 wine glasses, 27 decanters, and 63 water-bottles." The passengers for a single voyage will number between five and six hundred, and the company altogether gives employment to over 4,500 persons.

**Dr. Johnson on Preaching.**—No man was ever more an advocate of order and regularity in the services of the Church, and in all matters ecclesiastical, than Dr. Johnson. But in view of the highest objects of the Christian ministry, he

made light of outward proprieties compared with spiritual earnestness and usefulness. Talking of preaching, and of the great success of John Wesley and the Methodists, he said: "It is owing to their expressing themselves in a plain familiar manner, which is the only way to do good to the common people, and which clergymen of genius and learning ought to do from a principle of duty; a practice for which they will be praised by men of sense." And in the same spirit he wrote to a young clergyman an excellent letter of advice, in which he said: "All means must be tried by which souls may be saved." Dr. Johnson's words may be remembered by any one who is disposed to condemn methods of work or of preachers which he may not entirely approve.

**Steam Engine Inventor.**—The recent erection of a memorial to William Symington, the inventor of steam navigation, although made the occasion of a Scottish national demonstration, has by no means silenced other claims. Professor Sir W. Thomson, who presided on the occasion, spoke with dogmatic enthusiasm of his countryman; but the French renew the assertion of their claim to the invention of the earliest locomotive. In the *Conservatoire des Arts et Métiers* in Paris is an engraving of a steam-engine constructed by M. Cugnot, and used in 1769, but it was soon damaged and set aside. Mr. Murdoch, the assistant of James Watt, made an engine in 1784, the model of which was exhibited in 1884 at the Centenary festival in Newcastle in honour of Stephenson. But there is little doubt that Symington's engine was the first actually used in steam navigation, the boat being built for Mr. Miller, of Dalswinton, in Scotland, and tried on Dalswinton Loch in 1789.

**African Explorers.**—A list of the explorers who have crossed Africa has been published in the "Vossische Zeitung." It appears that from 1802 to 1811 the feat was accomplished by a Portuguese, Honorato de Costa; in 1838 and 1853 it was achieved by Francesco Coimbra and Silva Porto; in 1854 by Dr. Livingstone; in 1865 by Gerhard Rohlfs; in 1874 by Lieutenant Cameron and Mr. Stanley; then by Serpa Pinto and the Italians Mattenio and Massari; next by Lieutenant Wissmann, who crossed from St. Paul de Loanda to Sadani on the east coast, from 1882 to 1884; and recently by the Scotch missionary Arnat, the Portuguese Capello and Ivans, the Swedish Lieutenant Gleerup, who occupied the least time, crossing from Stanley Falls to Bagamoyo in six months; the Austrian Dr. Senz; Mr. Stanley for the second time; and, finally, Captain Trivier, the French traveller. The first explorer who crossed Africa took nearly ten years over the task, while the last occupied barely a year.

**Foreigners in Japan.**—In view of the agitation amongst the foreign residents of Japan against the proposal for placing them wholly under native jurisdiction, the following statistics from the last British Consular report from that country will be read with interest. At the close of 1889 the number of foreign residents at Tokio and the open ports (excluding those elsewhere in the interior) was 3,324. Of these 1,359 were British, 718 Americans, 459 Germans, 292 French, 113 Portuguese, 79 Dutch, and the remainder of other nationalities. The number of Chinese was 4,879, and that of Chinese business firms 277. The number of foreign business firms was 202, of which 94 were British, 37 German, 32 American, and 14 French.

**Sleeping under or in the Snow.**—The case of Mrs. Elizabeth Woodcock, who survived long burial under snow, may be known to many readers. This woman, forty-two years of age, of Impington, a village three miles north of Cambridge, lost her way in returning home from market on Saturday evening, February 2, 1799, and was buried seven feet deep in the snow. In this state she continued eight nights and eight days, when she was dug out alive on Sunday, February 10. She retained the full possession of her senses all the while she was immured. She died July 24, 1799. A somewhat similar case occurred in the snow-storm of November 1890. A middle-aged woman, named Alice Jane Lowe, belonging to Wigan, was admitted into Spalding workhouse in a very weak state, having been found by the relieving officer sleeping out in the snow in the Lincolnshire Fens, near Spalding. She was put to bed, and then stated that she had slept out for five weeks continuously, including, within the last few days, the severest weather of the year, when the snow covered the ground to the depth of nearly a foot. The poor woman's hair was in such a matted state that it had to be all cut off. She stated that she had tramped from Lancashire, where she had formerly been in domestic service, and at the time she was found in the snow she appeared to have lost her way. The workhouse officials consider it most remarkable that the woman survived the exposure and cold.

**Waterloo.**—A correspondent (G. H. I. B.) at the Bridge of Allan, Scotland, referring to the defeat of the French Imperial Guard by the flank attack of the 52nd Regiment, as described in the "Leisure Hour" for January 1890, says, "It is remarkable how few casualties occurred in the regiment." The rank and file of the 52nd, under Sir John Colborne, numbered 1,052. Of the regiment only one officer, Ensign Nettles, is said to have been killed in the action, and sixteen men. Eight officers and 174 men were wounded. Total casualties, 199. None were missing. In a little work published by Carfrae, of Edinburgh, in 1819, giving a detailed account of the battles of Quatre Bras, Ligny, and Waterloo, an appendix shows the strength of every regiment under Wellington at the beginning of the three days' fight, with the names of the officers, and list of the killed, wounded, and missing. Carfrae was a medical publisher, and it is likely that this book was written by an army surgeon. The grand attack of the 52nd is very clearly described in this book; and the swiftness of the unexpected movement, with the rapid firing of volleys on the dense column of the Guard, sufficiently accounts for their decisive defeat with comparatively small loss to the assailants.

**Postal Revenue.**—In the British postal service there seems to be a constant increase of revenue, which is little affected by social or political changes. Probably a larger effect would be produced by some change of fashion, such as the cessation of Christmas cards and presents, than from the greatest commercial or public events. A noteworthy fact is stated as to the reduction of postal revenue in New Orleans by nearly one-third, due to the passing of an anti-lottery law. In Roman Catholic cities everywhere vast sums are connected with the lottery system. From Ireland to England the circulars about ecclesiastical lotteries are numerous and importunate, and it is to be feared too successful in extracting money from moral lunatics who are tempted to invest in moonshine.

**A Plunge into Space.**—The spectroscope has convinced men of science that the planets and stars are composed of the same elements as our earth. Since Fontenelle wrote his "Plurality of Worlds," and Sir David Brewster gave the theory the support of his great name, there has been a popular belief that the inhabitants of other worlds may not be absolutely different from the people that dwell in our own planet. Starting with this idea, an ingenious writer, Mr. Cromie, has told the story, under the title of "A Plunge into Space," of an expedition to the planet Mars in a machine, the notion of which is worthy of the wild fancy of Jules Verne. One of the voyagers falls in love with a beautiful girl, and the story, with its romantic incidents and tragical ending, might belong to our own planet as well as to Mars.

**Five Generations.**—A correspondent at Rathmines, Dublin, asks if it is quite accurate to say (in reference to the remarkable case of longevity in "Varieties" for November "Leisure Hour") that old Mary Cooper *saw* five generations of descendants when she herself was one of the series of five? This is rather sharp a bit of criticism or casuistry; the "seeing" not implying actual vision at the moment, but only the "contemporaneousness" of five generations. Our correspondent says he "saw in the parish church of Mongret, near Limerick, four generations, all in the male line, and the great-grandson was then over twenty-two years old unmarried. Had he married when he came of age, he might have had a son representing the fifth generation." This would certainly have been a more remarkable fact than the five female generations of Cooper. Can no report be given of name, or parish record?

# Household Queries.

**Seltzogene Repairs.**—*Will you kindly advise me best steps to take in getting my Seltzogene repaired. The screw will not bite, therefore lets off the gas, then the charge is useless.*—No fair wear would so strip the screw itself that it would not hold. If it is so, it is either your fault or the maker's, and in either case your only plan is to get the tradesman of whom you bought it to send it to the manufacturers, or get a duplicate of the part. On the other hand, many gasogenes require a soft washer of leather or rubber inserted, against which the cap screws up tightly to make a join. You may have dropped this out unnoticed, and if so, the remedy is obvious, so long as the screw holds at all. No screw is itself gas-tight; it only screws up the joint which is so, and which needs the soft material.

**French Polishing.**—*Can you tell me how French Polishing is done? I have used a soft cloth with ball of cotton wool dipped in linseed oil and then in the polish, but cannot get a good face on the wood.*—It is a tedious operation, needing more rubbing than most novices are prepared for. The regular polisher makes a rubber by coiling up a piece of list, or a strip *torn* off woollen cloth so as to have a soft edge, into a flat coil one to three inches across. A double thickness of soft linen is stretched over the soft face of this, and gathered behind as a handle. He begins by holding the rubber without the cloth over the neck of the bottle and giving the bottle one good shake upwards, which puts about enough polish on it; then he puts the linen over, *on the linen* puts some oil with his finger, and begins to rub, which must be lightly and quickly and in one direction only. When nearly dry more polish is put on the rubber as before, but oil is seldom required till two or three coats have been rubbed in. When the rubber feels sticky, a trifle on the linen is added, but very little. A novice had better wait when five or six coats have been applied to see if it seems to soak entirely into the wood anywhere, and if so more must be applied; but the regular polisher knows, and when his coating is thick enough puts a little spirit inside the linen cloth instead of oil outside it, and rubs more quickly and lightly. The final glaze is given by a rubber made as you describe, and used very lightly with methylated spirit only. There is a great deal of knack in it, and need for experienced judgment; but we know by experience that amateurs *can* do fairly if their heads are screwed on the right way and they have patience.

**Beeswax.**—*What use can be made of the wax from honeycomb after the honey is taken from it, and what is the process to make it into the wax used by tailors, if this kind of wax is from a hive.*—Melt the comb in water nearly or quite boiling, and strain it when melted; it then becomes the yellow wax or beeswax of commerce. The difficulty of selling this is merely that shops now are used to buying in larger quantities from wholesale houses, and do not like small lots; but you may succeed with one of the tradesmen you deal with. If a bad colour, it is sometimes coloured with a little annatto. This wax is bleached into white wax by exposing it in thin flakes to the weather and sun, every now and then remelting and forming it into fresh flakes; but a great deal sold is adulterated with spermaceti. Domestically beeswax is used in furniture polish and for rubbing floors, and in the country people still sometimes make candles of it. Tailor's wax is little used now, as waxed thread will not work in sewing machines; it is or was made of a mixture of beeswax and soap.

**Removing Gold Paint.**—*I should very much like to know how to remove gold paint (Ozonised Enamel) from a marble mantel-piece, and also from china door-plates and bells, and from door-panels and wainscots. The gold enamel was put on about six months ago, but as it is looking blurred and dirty, I am now anxious to wash it off. I have tried soap and soda, but neither has any effect.*—Methylated ether will readily rub it off the china without injury, but the marble being porous is more doubtful; still, applied quickly and lightly with linen only moistened with ether, it will probably come off clean. From wood, however, any other varnish or paint would be removed along with the gold. It is rather foolish to apply to such surfaces anything that may have to come off again, as it sinks in more or less. On the whole, if you are pleased with the gold decoration as such, our advice would be to have them properly regilt over again in the ordinary way.

**Ice Cream.**—*Would you kindly insert a receipt for making ice cream.*—We presume you refer to the cream itself, not to the freezing. Where ices are made it is far better to buy a small freezing machine, when there is no trouble, and about a pint and a half of ice will only cost about threepence to freeze with the common mixture of ice and salt, and perhaps fourpence with chemical freezing powders. Ice can be made with a plain tub and a coffee-tin, but it is troublesome, and takes far more freezing material. Genuine cream is made *with* cream, a little milk being sometimes added. To this is added fruit or flavour to taste. Thus we may beat up one pound of strawberries and half pound sugar into a pulp, with a little lemon juice; rub through a sieve, and add a pint of cream, with or without half a pint of water. Or we may beat up with the cream one pound of fine raspberry jam and a little lemon juice. Or we may add to a pint of cream half pound of apricot jam, the juice of a lemon, six pounded bitter almonds, and a glass of noyeau. Then again we may add milk, sugar, and crushed Naples biscuits; or a chocolate cream may be made of six ounces chocolate scraped into half pint of new milk, added, with half pound of sugar, to one pint of cream. Anyone can vary such a list infinitely. For a *cheap* cream, make a custard with half a pint of milk, two yolks of eggs, a tablespoonful condensed milk, and sugar to taste; as soon as this is a little thick, stir it continuously till nearly cold, and add essence of almonds, or vanilla, or noyeau, or any other flavour fancied. This makes a fair cream, and if the flavouring be left out, crushed strawberries or raspberries and sugar may be added as before, or jam. Red fruit ices should be brightened, if necessary, by adding some red currants, or cochineal. Water ices are of the nature of lemonade, made stronger and flavoured to taste; or can be made by adding fruit syrups to water; or yet again by adding fruit juice to an equal quantity of plain sugar syrup, generally with a little lemon, which is used in most ices.

# THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN, AUTHOR OF "THE HOUSE OF THE WOLF," ETC.

"A GOOD FRIEND OF OURS"

### CHAPTER IX.—PLAYING WITH FIRE.

HE was a young man, and a Dutchman, but not a Dutchman of the stout burly type which I had most commonly seen in the country. He had, it is true, the usual fair hair and blue eyes, and he was rather short than tall; but his figure was thin and meagre, and he had a pointed nose and chin, and a scanty fair beard. I took him to be near-sighted; at a second glance I saw that he was angry. He was talking fast to Dymphna—of course in Dutch—and my first impulse, in face of his excited gestures and queer appearance, was to laugh. But I had a notion what his relationship to the girl was, and I smothered this, and instead asked, as soon as I could get a word in, whether I should leave them.

"Oh, no!" Dymphna answered, blushing slightly, and turning to me with a troubled glance I believe she had clean forgotten my presence. "This is Master Jan Van Tree, a good friend of ours. And this," she continued, still in Spansh,

but speaking to him, "is Master Carey, one of my father's guests."

We bowed, he formally, for he had not recovered his temper, and I—I dare say I still had my Spanish ancestors in my head—with condescension. We disliked one another at sight, I think. I dubbed him a mean little fellow, a trader, a peddler; and, however he classed me, it was not favourably. So it was no particular desire to please him which led me to say with outward solicitude, "I fear you are annoyed at something, Master Van Tree?"

"I am!" he said bluntly, meeting me half-way.

"And am I to know the cause?" I asked, "or is it a secret?"

"It is no secret!" he retorted. "Mistress Lindstrom should have been more careful. She should not have exposed herself to the chance of being seen by those miserable foreigners."

"The foreigners—in the boat?" I said dryly.

"Yes, of course—in the boat," he answered. He was obliged to say that, but he glared at me across her as he spoke. We had turned and were walking back to the house, the poplars casting long shadows across our path.

"They were rude," I observed carelessly, my chin very high. "But there is no particular harm done that I can see, Master Van Tree."

"Perhaps not, as far as you can see," he retorted in great excitement. "But perhaps also you are not very far-sighted. You may not see it now, yet harm will follow."

"Possibly," I said, and I was going to follow up this seemingly candid admission by something very boorish, when Mistress Dymphna struck in nervously.

"My father is anxious," she explained, speaking to me, "that I should have as little to do with our Spanish governors as possible, Master Carey. It always vexes him to hear that I have fallen in their way, and that is why my friend feels annoyed. It was not, of course, your fault, since you did not know of this. It was I," she continued hurriedly, "who should not have ventured to the elm-tree without seeing that the coast was clear."

I knew that she was timidly trying, her colour coming and going, to catch my eye; to appease me as the greater stranger, and to keep the peace between her ill-matched companions, who, indeed, stalked along eyeing one another much as a wolf-hound and a badger-dog might regard each other across a choice bone. But the young Dutchman's sudden appearance had put me out. I was not in love with her, yet I liked to talk to her, and I grudged her to him, he seemed so mean a fellow. And so—churl that I was—in answer to her speech I let drop some sneer about the great fear of the Spaniards which seemed to prevail in these parts.

"*You* are not afraid of them, then?" Van Tree said, with a smile.

"No, I am not," I answered, my lip curling also.

"Ah!" with much meaning. "Perhaps you do not know them very well."

"Perhaps not," I replied. "Still, my grandmother was a Spaniard."

"So I should have thought," he retorted swiftly. So swiftly that I felt the words as I should have felt a blow. "What do you mean?" I blurted out, halting before him, with my cheek crimson. In vain were all Dymphna's appealing glances, all her signs of distress. "I will have you explain, Master Van Tree, what you mean by that?" I repeated fiercely.

"I mean what I said," he answered, confronting me stubbornly, and shaking off Dymphna's hand. His blue eyes twinkled with rage, his thin beard bristled; he was the colour of a turkey-cock's comb. At home we should have thought him a comical little figure; but he did not seem so absurd here. For one thing, he looked spiteful enough for anything; and for another, though I topped him by a head and shoulders, I could not flatter myself that he was afraid of me. On the contrary, I felt that in the presence of his mistress, small and short-sighted as he was, he would have faced a lion without winking.

His courage was not to be put to the proof. I was still glaring at him, seeking some retort which should provoke him beyond endurance, when a hand was laid on my shoulder, and I turned to find that Master Bertie and the Duchess had joined us.

"So here are the truants," the former said pleasantly, speaking in English, and showing no consciousness whatever of the crisis in the middle of which he had come up, though he must have discerned in our defiant attitudes and in Dymphna's troubled face that something was wrong. "You know who this is, Master Francis," he continued heartily. "Or have you not been introduced to Master Van Tree, the betrothed of our host's daughter?"

"Mistress Dymphna has done me that honour," I said stiffly, recovering myself in appearance, while at heart sore and angry with everybody. "But I fear the Dutch gentleman has not thanked her for the introduction, since he learned that my grandmother was Spanish."

"*Your* grandmother, do you mean?" cried the Duchess, much astonished.

"Yes, madam."

"Well, to be sure!" she exclaimed, lifting up her hands, and appealing whimsically to the others. "This boy is full of starts and surprises. You never know what he will produce next. The other day it was a warrant! To-day it is a grandmother, and a temper!"

I could not be angry with her; and perhaps I was not sorry now that my quarrel with the young Dutchman had stopped where it had. I affected as well as I could to join in the laugh at my expense, and took advantage of the arrival of our host—who at this moment came up the slope from the landing-place, his hands outstretched and a smile of greeting on his kindly face—to slip away unnoticed, and make amends to my humour by switching off the heads of the withes by the river.

But naturally the scene left a degree of ill-feeling behind it; and for the first time, during the two months we had spent under Master Lindstrom's roof, the party who sat down to supper were under some constraint. I felt that the young Dutchman had had the best of the bout in the garden; and I talked loudly and foolishly in the boyish attempt to

assert myself, and to set myself right at least in my own estimation. Master Van Tree meanwhile sat silent, eyeing me from time to time in no friendly fashion. Dymphna seemed nervous and frightened, and the Duchess and her husband exchanged troubled glances. Only our host and Mistress Anne, who was in particularly good spirits, were unaffected by the prevailing chill.

Mistress Anne, indeed, in her ignorance, made matters worse. She had begun to pick up some Dutch, and was fond of airing her knowledge and practising fresh sentences at meal-times. By some ill-luck she contrived this evening — particularly after, finding no one to contradict me, I had fallen into comparative silence—to frame her sentences so as to cause as much embarrassment as possible to all of us. "Where did you walk with Dymphna this morning?" was the question put to me. "You are fond of the water; Englishmen are fond of the water," she said to Dymphna. "Dymphna is tall; Master Francis is tall. I sit by you to-night; the Dutch lady sat by you last night," and so on, and so on, with prattle which seemed to amuse our host exceedingly—he was never tired of correcting her mistakes—but which put the rest of us out of countenance, bringing the tears to poor Dymphna's eyes—she did not know where to look—and making her lover glower at me as though he would eat me.

It was in vain that the Duchess made spasmodic rushes into conversation, and in the intervals nodded and frowned at the delinquent. Mistress Anne in her innocence saw nothing. She went on until Van Tree could stand it no longer, and with a half-smothered threat, which was perfectly intelligible to me, rose roughly from the table, and went to the door as if to look out at the night.

"What is the matter?" Mistress Anne said wonderingly in English. Her eyes seemed at length to be opened to the fact that something was amiss with us.

Before I could answer, the Duchess, who had risen, came behind her. "You little fool!" she whispered fiercely, "if fool you are. You deserve to be whipped!"

"Why, what have I done?" murmured the girl, really frightened now, and appealing to me.

"Done!" whispered the Duchess; and I think she pinched her, for my neighbour winced. "More harm than you guess, you minx! And for you, Master Francis, a word with you. Come with me to my room, please."

I went with her, half-minded to be angry, and half inclined to feel ashamed of myself. She did not give me time, however, to consider which attitude I should take up, for the moment the door of her room was closed behind us, she turned upon me, the colour high in her cheeks. "Now, young man," she said in a tone of ringing contempt. "Do you really think that that girl is in love with you?"

"What girl?" I asked sheepishly. The unexpected question and her tone put me out of countenance.

"What girl? What girl?" she replied impatiently. "Don't play with me, boy! You know whom I mean. Dymphna Lindstrom!"

"Oh, I thought you meant Mistress Anne," I said, somewhat impertinently.

Her face fell in an extraordinary fashion, as if the suggestion were not pleasant to her. But she answered on the instant: "Well! The vanity of the lad! Do you think all the girls are in love with you? Because you have been sitting with a pretty face on each side of you, do you think you have only to throw the handkerchief this way or that? If you do, open your eyes, and you will find it is not so. My kinswoman can take care of herself, so we will leave her out of the discussion, please. And for this pink-and-white Dutch girl," my lady continued viciously, "let me tell you that she thinks more of Van Tree's little finger than of your whole body."

I shrugged my shoulders, but still I was mortified. A young man may not be in love with a girl, yet it displeases him to hear that she is indifferent to him.

The Duchess noticed the movement. "Don't do that," she cried in impatient scorn. "You do not see much in Master Van Tree, perhaps? I thought not. Therefore you think a girl must be of the same mind as yourself. Well," with a fierce little nod, "you will learn some day that it is not so, that women are not quite what men think them; and particularly, Master Francis, that six feet of manhood, and a pretty face on top of it, do not always have their way. But there, I did not bring you here to tell you that. I want to know whether you are aware what you are doing?"

I muttered something to the effect that I did not know I was doing any harm.

"You do not call it harm, then," the Duchess retorted with energy, "to endanger the safety of every one of us? Cannot you see that if you insult and offend this young man—which you are doing out of pure wanton mischief, for you are not in love with the girl—he may ruin us?"

"Ruin us?" I repeated incredulously.

"Yes, ruin us!" she cried. "Here we are, living more or less in hiding through the kindness of Master Lindstrom—living in peace and quietness. But do you suppose that inquiries are not being made for us? Why, I would bet a dozen gold angels that Master Clarence is in the Netherlands at this moment tracking us."

I was startled by this idea, and she saw I was. "We can trust Master Lindstrom were it only for his own sake," she continued more quietly, satisfied perhaps with the effect she had produced. "And this young man, who is the son of one of the principal men of Arnheim, is also disposed to look kindly on us, as I fancy it is his nature to look. But if you make mischief between Dymphna and him—"

"I have not," I said.

"Then do not," she replied sharply. "Look to it for the future. And more, do not let him fancy it possible. Jealousy is as easily awakened as it is hardly put to sleep. A word from this young man to the Spanish authorities, and we should be hauled back to England in a trice, if worse did not befall us here. Now, you will be careful?"

"I will," I said, conscience-stricken and a little cowed.

"That is better," she replied, smiling. "I think you will. Now go."

I went down again with some food for thought—with some good intentions too. But I was to find—the discovery is made by many—that good resolutions commonly come too late. When I went downstairs I found my host and Master Bertie alone in the parlour. The girls had disappeared, so had Van Tree, and I saw at once that something had happened. Master Bertie was standing gazing at the stove very thoughtfully, and the Dutchman was walking up and down the room with an almost comical expression of annoyance and trouble on his pleasant face.

"Where are the young ladies?" I asked.

"Upstairs," said Master Bertie, not looking at me.

"And—and Van Tree?" I asked mechanically. Somehow I anticipated the answer.

"Gone!" said the Englishman, curtly.

"Ay, gone, the foolish lad!" the Dutchman struck in, tugging at his beard. "What has come to him? He is not wont to show temper. I have never known him and Dymphna have a cross word before. What has come to the lad, I say, to go off in a passion at this time of night? And no one knows whither he has gone, or when he will come back again!"

He seemed as he spoke hardly conscious of my presence; but Master Bertie turned and looked at me, and I hung my head, and very shortly afterwards I slunk out. The thought of what I might have brought upon us all by my petulance and vanity made me feel sick. I crept up to bed nervous and fearful of the morrow, listening to every noise without, and praying inwardly that my alarm might not be justified.

When the morrow came I went downstairs as anxious to see Van Tree in the flesh as I had been yesterday disappointed by his appearance. But no Van Tree was there to be seen. Nothing had been heard of him. Dymphna moved restlessly about, her cheeks pale, her eyes downcast, and if I had ever flattered myself that I was anything to the girl, I was undeceived now. The Duchess shot angry glances at me from time to time. Master Bertie kept looking anxiously at the door. Every one seemed to fear and to expect something. But none of them feared and expected it as I did.

"He must have gone home; he must have gone to Arnheim," said our host, trying to hide his vexation. "He will be back in a day or two. Young men will be young men."

But I found that the Duchess did not share the belief that Van Tree had gone home; for in the course of the morning she took occasion, when we were alone, to charge me to be careful not to come into collision with him.

"How can I, now he has gone?" I said meekly, feeling I was in disgrace.

"He has not gone far," replied the Duchess, meaningly. "Depend upon it, he will not go far out of sight unless there is more harm done than I think, or he is very different from English lovers. But if you come across him, I pray you to keep clear of him, Master Francis."

I nodded assent.

But of what weight are resolutions with fate in the other scale! It was some hours after this, towards two o'clock indeed, when Mistress Anne came to me, looking flurried and vexed. "Have you seen Dymphna?" she asked abruptly.

"No," I answered. "Why?"

"Because she is not in the house," the girl answered, speaking quickly, "nor in the garden; and the last time I saw her she was crossing the island towards the footbridge. I think she has gone that way to be on the look-out—you can guess for whom," with a smile. "But I am fearful lest she shall meet some one else, Master Francis; she is wearing her gold chain, and one of the maids says that she saw two of the Spanish garrison on the road near the end of the footbridge this morning. That is the way by land to Arnheim, you know."

"That is bad," I said. "What is to be done?"

"You must go and look for her," Anne suggested. "She should not be alone."

"Let her father go, or Master Bertie," I answered.

"Her father has gone down the river—to Arnheim, I expect; and Master Bertie is fishing in a boat somewhere. It will take time to find him. Why cannot you go? If she has crossed the footbridge she will not be far away."

She seemed so anxious as she spoke for the Dutch girl's safety that she infected me with her fears, and I let myself be persuaded. After all, there might be danger, and I did not see what else was to be done. Indeed, Mistress Anne did not leave me until she had seen me clear of the orchard and half-across the meadows towards the footbridge. "Mind you bring her back," she cried after me. "Do not let her come alone!" And those were her last words.

After we had separated I did think for a moment that it was a pity I had not asked her to come with me. But the thought occurred too late, and I strode on towards the head of the bridge, resolving that, as soon as I had sighted Dymphna, I would keep away from her and content myself with watching over her from a distance. As I passed by the little cluster of cottages on the landward side of the island, I glanced sharply about me, for I thought it not unlikely that Master Van Tree might be lurking in the neighbourhood. But I saw nothing either of her or him. All was quiet, the air full of spring sunshine and warmth and hope and the blossoms of fruit-trees; and with an indefinable pleasure, a feeling of escape from control and restraint, I crossed the long footbridge, and set foot, almost for the first time since our arrival—for at Master Lindstrom's desire we had kept very close—on the river bank.

To the right a fair road or causeway along the waterside led to Arnheim. At the point where I stood, this road on its way from the city took a turn at right angles, running straight away from the river to avoid a wide track of swamp and mere which lay on my left—a quaking marsh many miles round, overgrown with tall rushes and sedges, which formed the head of the bay in which our island lay. I looked up the long straight road to Arnheim, and saw only a group of travellers moving slowly along it, their backs towards me. The road before me was bare of passengers. Where, then, was Dymphna if she had crossed the bridge? In the last resort I scanned the green expanse of rushes and willows, which stretched, with intervals of open water, as far as the eye could reach on my

left. It was all rustling and shimmering in the light breeze, but my eye picked out one or two raised dykes which penetrated it here and there, and served at once as pathways to islets in the mere and as breastworks against further encroachments of the river. Presently, on one of these, of which the course was fairly defined by a line of willows, I made out the flutter of a woman's hood. And I remembered that the day before I had heard Dymphna express a wish to go to the marsh for some herb which grew there.

"Right!" I said, seating myself with much satisfaction on the last post of the bridge. "She is safe enough there! And I will go no nearer. It is only on the road she is likely to be in danger from our Spanish gallants!"

My eyes, released from duty, wandered idly over the landscape for awhile, but presently returned to the dyke across the mere. I could not now see Dymphna. The willows hid her, and I waited for her to reappear. She did not, but some one else did; for by-and-by, on the same path and crossing an interval between the willows, there came into sight a man's form.

"Ho! ho!" I said, following it with my eyes. "So I may go home! Master Van Tree is on the track. And now I hope they will make it up!" I added pettishly.

Another second and I started up with a low cry. The sunlight had caught a part of the man's dress, a shining something which flashed back a point of intense light. The something I guessed at once was a corslet, and it needed scarce another thought to apprise me that Dymphna's follower was not Van Tree at all, but a Spanish soldier!

I lost no time; yet it took me a minute—a minute of trembling haste and anxiety—to discover the path from the causeway on to the dyke. When once I had stumbled on to the latter I found I had lost sight of both figures; but I ran along at the top of my speed, calculating that the two, who could not be far apart, the man being the nearer to me, were about a quarter of a mile or rather more from the road. I had gone one-half of this distance perhaps when a shrill scream in front caused me to redouble my efforts. I expected to find the ruffian in the act of robbing the girl, and clutched my cudgel—for, alas! I had left my sword at home—more tightly in my grasp; so that it was an immense relief to me when on turning an angle in the dyke I saw her running towards me. Her face, still white with fear, however, and her hair streaming loosely behind her, told how narrow had been her escape—if escape it could be called. For about ten feet behind her, the hood he had plucked off still in his grasp, came Master Spaniard, hot-foot and panting, but gaining on her now with every stride.

He was a tall fellow, gaily dressed, swarthy, moustachioed, and fierce-eyed. His corslet and sword-belt shone and jingled as he ran and swore; but he had dropped his feathered bonnet in the slight struggle which had evidently taken place when she got by him; and it lay a black spot in the middle of the grassy avenue behind him. The sun—it was about three hours after noon—was at my back, and shining directly into his eyes, and I marked this as I raised my cudgel and jumped aside to let the girl pass; for she in her blind fear would have run against me.

It was almost the same with him. He did not see me until I was within a few paces of him, and even then I think he noticed my presence merely as that of an unwelcome spectator. He fancied I should step aside; and he cursed me, calling me a Dutch dog for getting in his way.

The next moment—he had not drawn his sword nor made any attempt to draw it—we came together violently, and I had my hand on his throat. We

ABOUT TEN FEET BEHIND CAME MASTER SPANIARD.

swayed as we whirled round one another in the first shock of the collision. A cry of astonishment escaped him—astonishment at my hardihood. He tried, his eyes glaring into mine, and his hot breath on my cheek, to get at his dagger. But it was too late. I brought down my staff with all the strength of an arm nerved at the moment by rage and despair upon his bare head.

He went down like a stone, and the blood bubbled from his lips. I stood over him watching him. He stretched himself out and turned with a convulsive movement on his face. His hands clawed the grass. His leg moved once, twice, a third time faintly. Then he lay still.

There was a lark singing just over my head, and

its clear notes seemed, during the long long minute while I stood bending over him in an awful fascination, to be the only sounds in nature. I looked so long at him in that dreadful stillness and absorption, I dared not at last look up lest I should see I knew not what. Yet when a touch fell on my arm I did not start.

"You have killed him," the girl whispered, shuddering.

"Yes, I have killed him," I answered mechanically.

I could not take my eyes off him. It was not as if I had done this thing after a long conflict, or in a *mêlée* with others fighting round me, or on the battle-field. I should have felt no horror then such as I felt now, standing over him in the sunshine with the lark's song in my ears. It had happened so quickly, and the waste about us was so still; and I had never killed a man before, nor seen a man die.

"Oh, come away!" Dymphna wailed suddenly. "Come away!"

I turned then, and the sight of the girl's wan face and strained eyes recalled me in some degree to myself. I saw she was ill; and hastily I gave her my arm, and partly carried, partly supported, her back to the road. The way seemed long and I looked behind me often. But we reached the causeway at last, and there in the open I felt some relief. Yet even then, stopping to cast a backward glance at the marsh, I shuddered anew, espying a bright white spark gleaming amid the green of the rushes. It was the dead man's corslet. But if it had been his eye I could scarcely have shrunk from it in greater dread.

It will be imagined that we were not long in crossing the island. Naturally I was full of what had happened, and never gave a thought to Van Tree's jealousy, or the incidents of his short visit. I had indeed forgotten his existence until we reached the porch. There entering rapidly, with Dymphna clinging to my arm, I was so oblivious of other matters that when the young Dutchman rose suddenly from the seat on one side of the door, and at the same moment the Duchess rose from the bench on the other, I did not understand in the first instant of surprise what was the matter, though I let Dymphna's hand fall from my arm. The dark scowling face of the one, however, and the anger and chagrin written on the features of the other, as they both glared at us, brought all back to me in a flash. But it was too late. Before I could utter a word the girl's lover pushed by me with a fierce gesture and fiercer cry, and disappeared round a corner of the house.

"Was ever such folly!" cried the Duchess, stamping her foot, and standing before us, her face crimson. "Or such fools! You idiot! You—"

IT HAD HAPPENED SO QUICKLY.

"Hush, madam," I said sternly—had I really grown older in doing the deed?—"something has happened."

And Dymphna, with a low cry of "The Spaniard! The Spaniard!" tottered up to her and fainted in her arms.

### CHAPTER X.—THE FACE IN THE PORCH.

"THIS is a serious matter," said Master Bertie thoughtfully, as we sat in conclave an hour later round the table in the parlour. Mistress Anne was attending to Dymphna upstairs, and Van Tree had not returned again; so that we had been unable to tell him of the morning's adventure. But the rest of us were there. "It considerably adds to the danger of our position," Bertie continued.

"Of course it does," his wife said promptly. "But Master Lindstrom here can best judge of that, and of what course it will be safest to take."

"It depends," our host answered slowly, "upon whether the dead man be discovered before night. You see if the body be not found—"

"Well?" said my lady impatiently, as he paused.

"Then we must some of us go after dark and bury him," he decided. "And perhaps, though he will be missed at the next roll-call in the city, his death may not be proved, or traced to this neighbourhood. In that case the storm will blow over, and things be no worse than before."

"I fear there is no likelihood of that," I said; "for I am told he had a companion. One of the maids noticed them lurking about the end of the bridge more than once this morning."

Our host's face fell.

"That is bad," he said, looking at me in evident consternation. "Who told you?"

"Mistress Anne. And one of the maids told her. It was that which led me to follow your daughter."

The old man got up for about the fortieth time, and shook my hand, while the tears stood in his eyes and his lip trembled. "Heaven bless you, Master Carey!" he said. "But for you, my girl might not have escaped."

He could not finish. His emotion choked him, and he sat down again. The event of the morning—his daughter's danger, and my share in averting it—had touched him as nothing else could have touched him. I met the Duchess's eyes, and they too were soft and shining, wearing an expression very different from that which had greeted me on my return with Dymphna.

"Ah, well! she is safe," Master Lindstrom resumed when he had regained his composure. "Thanks to heaven and your friend, madam! Small matter now if house and lands go!"

"Still, let us hope they will not," Master Bertie said. "Do you think these miscreants were watching the island on our account? That some information had been given as to our presence, and they were sent to learn what they could?"

"No, no!" the Dutchman answered confidently. "It was the sight of the girl and her gewgaws yesterday brought them, the villains! There is nothing safe from them and nothing sacred to them. They saw her as they passed up in the boat, you remember."

"But then, supposing the worst to come to the worst?"

"We must escape across the frontier to Wesel, in the Duchy of Cleves," replied Lindstrom in a matter-of-fact tone, as if he had long considered and settled the point. "The distance is not great, and in Wesel we may find shelter, at any rate for a time. Even there, if pressure be brought to bear upon the Government to give us up, I would not trust it. Yet for a time it may do."

"And you would leave all this?" the Duchess said in wonder, her eyes travelling round the room, so clean and warm and comfortable, and settling at length upon the great armoire of plate which happened to be opposite to her. "You would leave all this at a moment's notice?"

"Yes, madam, all we could not carry with us," he answered simply. "Honour and life, these come first. And I thank heaven that I live here within reach of a foreign soil, and not in the interior where escape would be hopeless."

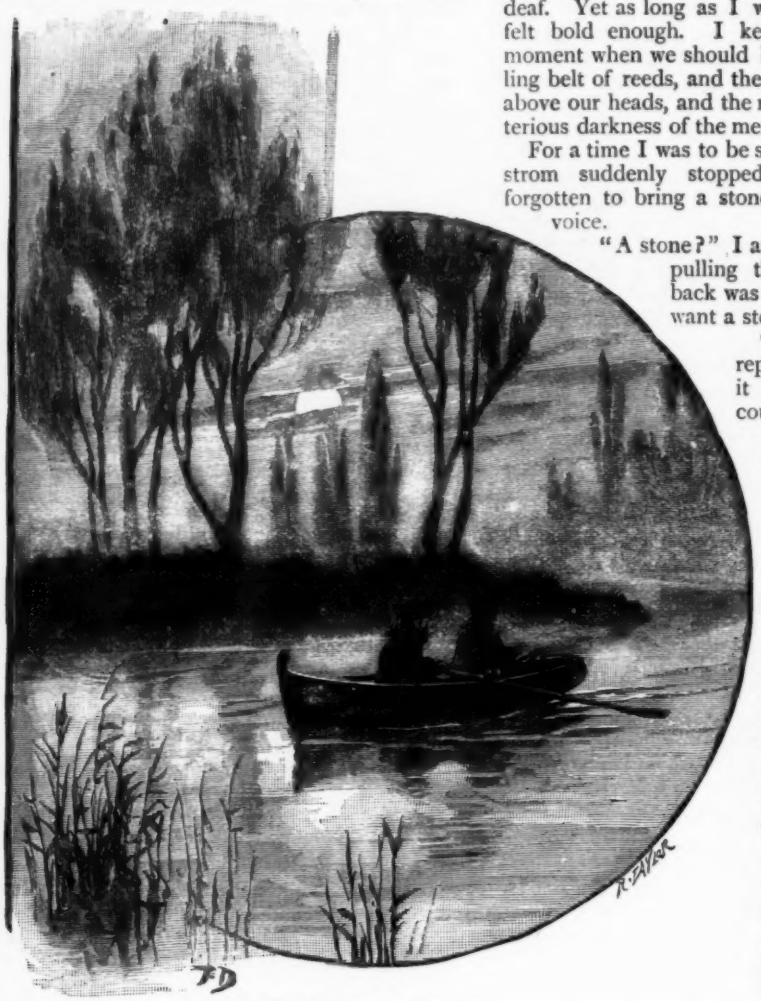
"But if the true facts were known," the Duchess urged, "would you still be in danger? Would not the magistrates protect you? The Schout and Schepen as you call them? They are Dutchmen."

"Against a Spanish governor and a Spanish garrison?" he replied with bitter emphasis. "Ay, they would protect me—as one sheep protects another against the wolves. No! I dare not risk it. Were I in prison what would become of Dymphna?"

"Master Van Tree?"

"He has the will to shelter her, no doubt. And his father has influence; but such as mine, a broken reed to trust to. Then Dymphna is not all. Once in prison, whatever the charge, there would be questioning about religion; perhaps," with a faint smile, "questioning about my guests."

"I suppose you know best," said the Duchess, with a sigh. "But I hope the worst will not come to the worst."



"Amen to that!" he answered quite cheerfully.

Indeed, it was strange that we seemed to feel more sorrow at the prospect of leaving this haven of a few weeks, than our host of quitting the home of a lifetime. But the necessity had come upon us suddenly, while he had contemplated it for years. So much fear and humiliation had mingled with his enjoyment of his choicest possessions that this long-expected moment brought with it a feeling akin to relief.

For myself I had a present trouble that outweighed any calamity of to-morrow. Perforce, since I alone knew the spot where the man lay, I must be one of the burying party. My nerves had not recovered from the blow which the sight of the Spaniard lying dead at my feet had dealt them so short a time before, and I shrank with a natural repulsion from the task before me. Yet there was no escaping it, no chance of escaping it, I saw.

None the less, throughout the silent meal to which we four sat down together, neither the girls nor Van Tree appearing, were my thoughts taken up with the business which was to follow. I heard

our host, who was to go with me, explaining that there was a waterway right up to the dyke, and that we would go by boat; and heard him with apathy. What matter how we went if such were the object of our journey? I wondered how the man's face would look when we came to turn him over, and pictured it in all ghastliest shapes. I wondered whether I should ever forget the strange spasmodic twitching of his leg, the gurgle—half oath, half cry—which had come with the blood from his throat. When Lindstrom said the moon was up and bade

A GOOD NIGHT FOR THE PURPOSE.

me come with him to the boat, I went mechanically. No one seemed to suspect me of fear. I suppose they thought that as I had not feared to kill him, I should not fear him dead. And in the general silence and moodiness I escaped notice.

"It is a good night for the purpose," the Dutchman said, looking about when we were outside. "It is light enough for us, yet not so light that we run much risk of being seen."

I assented, shivering. The moon was almost at the full, and the weather was dry, but scud after scud of thin clouds sweeping across the breezy sky, obscured the light from time to time, and left nothing certain. We loosed the smallest boat in silence, and getting in, pulled gently round the lower end of the island, making for the fringe of rushes which marked the line of division between river and fen. We could hear the frogs croaking in the marsh, and the water lapping the banks, and gurgling among the tree-roots, and making a hundred strange noises to which daylight ears are deaf. Yet as long as I was in the open water I felt bold enough. I kept my tremors for the moment when we should brush through the rustling belt of reeds, and the willows should whisper above our heads, and the rank vegetation, the mysterious darkness of the mere should shut us in.

For a time I was to be spared this. Master Lindstrom suddenly stopped rowing. "We have forgotten to bring a stone, lad," he said in a low voice.

"A stone?" I answered, turning. I was pulling the stroke oar, and my back was towards him. "Do we want a stone?"

"To sink the body," he replied. "We cannot bury it in the marsh, and if we could it were trouble thrown away. We must have a stone."

"What is to be done?" I asked, leaning on my oar and shivering, as much in impatience as nervousness. "Must we go back?"

"No, we are not far from the causeway now," he answered, with Dutch coolness. "There are some big stones, I fancy, by the end of the bridge. If not, there are some lying among the cottages just across the bridge. Your eyes are younger than mine, so you had better go. I will pull on, and land you."

I assented, and the boat's course being changed a point or two, three minutes' rowing laid her bows on the mud, some fifty yards from the landward end of the bridge, and just in the shadow of the causeway. I sprang ashore and clambered up. "Hist!" he cried, warning me as I was about to start on my errand. "Go about it quietly, Master Francis. The people will probably be in bed. But be secret."

I nodded and moved off, as warily as he could desire. I spent a minute or two peering about the causeway, but I found nothing that would serve our purpose. There was no course left then but to cross the planks, and seek what I wanted in the hamlet. Remembering how the timbers had

creaked and clattered when I went over them in the daylight, I stole across on tiptoe. I fancied I had seen a pile of stones near one of the posts at that end, but I could not find them now, and after groping about awhile—for this part was at the moment in darkness—I crept cautiously past the first hovel, peering to right and left as I went. I did not like to confess to myself that I was afraid to be alone in the dark, but that was nearly the truth. I was feverishly anxious to find what I wanted and return to my companion.

Suddenly I paused and held my breath. A slight sound had fallen on my ears, nervously ready to catch the slightest. I paused and listened. Yes, there it was again ; a whispering of cautious voices close by me, within a few feet of me. I could see no one. But a moment's thought told me that the speakers were hidden by the farther corner of the cottage abreast of which I stood. The sound of human voices, the assurance of living companionship, steadied my nerves, and to some extent rid me of my folly. I took a step to one side, so as to be more completely in the shadow cast by the reed-thatched eaves, and then softly advanced until I commanded a view of the whisperers.

They were two, a man and a woman. And the woman was of all people Dymphna ! She had her back to me, but she stood in the moonlight, and I knew her hood in a moment. The man—surely the man was Van Tree then, if the woman was Dymphna ? I stared. I felt sure it must be Van Tree. It was wonderful enough that Dymphna should so far have regained nerve and composure as to rise and come out to meet him. But in that case her conduct, though strange, was explicable. If not, however, if the man were not Van Tree—

Well, he certainly was not. Stare as I might, rub my eyes as I might, I could not alter the man's figure, which was of the tallest, whereas I have said that the young Dutchman was short. This man's face, too, though it was obscured, as he bent over the girl, by his cloak, which was pulled high up about his throat, was swarthy ; swarthy and beardless, I made out. More, his cap had a feather, and even as he stood still I thought I read the soldier in his attitude. The soldier and the Spaniard !

What did it mean ? On what strange combination had I lit ? Dymphna and a Spaniard ! Impossible. Yet a thousand doubts and thoughts ran riot in my brain, a thousand conjectures jostled one another to get uppermost. What was I to do ? What ought I to do ? Go nearer to them, as near as possible, and listen and learn the truth ? Or steal back the way I had come, and fetch Master Lindstrom ? But first, was it certain that the girl was there of her own free-will ? Yes, the question was answered as soon as put. The man laid his hand gently on her shoulder. She did not draw back.

Confident of this, and consequently of Dymphna's bodily safety, I hesitated, and was beginning to consider whether the best course might not be to withdraw and say nothing, leaving the question of future proceedings to be decided after I had spoken to her on the morrow, when a movement diverted my thoughts. The man at last raised his head. The moonlight fell cold and bright on his face, displaying every feature as clearly as if it had been day. And though I had only once seen his face before, I knew it again.

And knew him ! In a second I was back in England, looking on a far different scene. I saw the Thames, its ebb tide rippling in the sunshine as it ripples past Greenwich, and a small boat gliding over it, and a man in the bow of the boat, a man with a grim lip and a sinister eye. Yes, the tall soldier talking to Dymphna in the moonlight, his cap the cap of a Spanish guard, was Master Clarence ! the Duchess's chief enemy !

I stayed my foot. With a strange settling into resolve of all my doubts I felt if my sword, which happily I had brought with me, was loose in its sheath, and leaned forward scanning him. So he had tracked us ! He was here ! With wonderful vividness I pictured all the dangers which menaced the Duchess, Master Bertie, the Lindstroms, myself, through his discovery of us, all the evils which would befall us if the villain went away with his tale. Forgetting Dymphna's presence, I set my teeth hard together. He should not escape me this time.

But man can only propose. As I took a step forward, I trod on a round piece of wood which turned under my foot, and I stumbled. My eye left the pair for a second. When it returned to them they had taken the alarm. Dymphna had started away, and I saw her figure retreating swiftly in the direction of the house. The man poised himself a moment irresolute opposite to me : then dashed aside and disappeared behind the cottage.

I was after him on the instant, my sword out, and caught sight of his cloak as he whisked round a corner. He dodged me twice round the next cottage, the one nearer the river. Then he broke away and made for the bridge, his object evidently to get off the island. But he seemed at last to see that I was too quick for him—as I certainly was—and should catch him half-way across the narrow planking ; and changing his mind again he doubled nimbly back and rushed into the open porch of a cottage, and I heard his sword ring out. I had him at bay.

At bay indeed ! But ready as I was, and resolute to capture or kill him, I paused. I hesitated to run in on him. The darkness of the porch hid him, while I must attack with the moonlight shining on me. I peered in cautiously. "Come out !" I cried. "Come out, you coward !" Then I heard him move, and for a moment I thought he was coming, and I stood a-tiptoe waiting for his rush. But he only laughed a derisive laugh of triumph. He had the odds, and I saw he would keep them.

I took another cautious step towards him, and shading my eyes with my left hand, tried to make him out. As I did so, gradually his face took dim form and shape, confronting mine in the darkness. I stared yet more intently. The face became more clear. Nay, with a sudden leap into vividness, as it were, it grew white against the dark background —white and whiter. It seemed to be thrust out nearer and nearer, until it almost touched mine.

It—his face? No, it was not his face! For one awful moment a terror which seemed to still my heart glued me to the ground where I stood, as it flashed upon my brain that it was another face that grinned at me so close to mine, that it was another face I was looking on: the livid blood-stained face and stony eyes of the man I had killed!

With a wild scream I turned and fled. By instinct, for terror had deprived me of reason, I hied to the bridge, and keeping, I knew not how, my footing upon the loose clattering planks, made one desperate rush across it. The shimmering water below, in which I saw that face a thousand times reflected, the breeze which seemed the dead man's hand clutching me, lent wings to my flight. I sprang at a bound from the bridge to the bank, from the bank to the boat, and overturning, yet never seeing, my startled companion, shoved off from the shore with all my might—and fell a-crying.

A very learned man, physician to the Queen's Majesty, has since told me, when I related this strange story to him, that probably that burst of tears saved my reason. It so far restored me at any rate that I presently knew where I was—cowering in the bottom of the boat with my eyes covered: and understood that Master Lindstrom was leaning over me in a terrible state of mind, imploring me in mingled Dutch and English to tell him what had happened. "I have seen him!" was all I could say at first, and I scarcely dared remove my hands from my eyes. "I have seen him!" I begged my host to row away from the shore, and after a time was able to tell him what the matter was, he sitting the while with his arm round my shoulder.

"You are sure that it was the Spaniard?" he said kindly, after he had thought a minute.

"Quite sure," I answered, shuddering yet with less violence. "How could I be mistaken? If you had seen him—"

"And you are sure—did you feel his heart this morning? Whether it was beating?"

"His heart?" Something in his voice gave me courage to look up, though I still shunned the water lest that dreadful visage should rise from the depths. "No, I did not touch him."

"And you tell me that he fell on his face. Did you turn him over?"

"No." I saw his drift now. I was sitting erect. My brain began to work again. "No," I admitted; "I did not."

"Then how—" asked the Dutchman, roughly—"how do you know that he was dead, young sir? Tell me that."

When I explained, "Bah!" he cried. "There is nothing in that! You jumped to a conclusion. I thought a Spaniard's head was harder to break. As for the blood coming from his mouth, perhaps he bit his tongue, or did any one of a hundred things—except die, Master Francis. That you may be sure is just what he did not do."

"You think so?" I said gratefully. I began to look about me, yet still with a tremor in my limbs, and an inclination to start at shadows.

"Think?" he rejoined, with a heartiness which brought conviction home to me; "I am sure of it. You may depend upon it that Master Clarence, or the man you take for Master Clarence—who no doubt was the other soldier seen with the scoundrel this morning—found him hurt late in the evening. Then, seeing him in that state, he put him in the porch for shelter, either because he could not get him to Arnheim at once, or because he did not wish to give the alarm before he had made his arrangements for netting your party."

"That is possible!" I allowed, with a sigh of relief. "But what of Master Clarence?"

"Well," the old man said; "let us get home first. We will talk of him afterwards."

I felt he had more in his mind than appeared, and I obeyed; growing ashamed now of my panic, and looking forward with no very pleasant feelings to hearing the story narrated. But when we reached the house, and found Master Bertie and the Duchess in the parlour waiting for us—they rose startled at sight of my face—he bade me leave that out, but tell the rest of the story.

I complied, describing how I had seen Dymphna meet Clarence, and what I had observed to pass between them. The astonishment of my hearers may be imagined. "The point is very simple," said our host coolly, when I had in the face of many exclamations and some incredulity completed the tale; "it is just this! The woman certainly was not Dymphna. In the first place, she would not be out at night. In the second place, what could she know of your Clarence, an Englishman and a stranger? In the third place, I will warrant she has been in her room all the evening. Then if Master Francis was mistaken in the woman, may he not have been mistaken in the man? That is the point."

"No," I said boldly. "I only saw her back. I saw his face."

"Certainly that is something," Master Lindstrom admitted reluctantly.

"But how many times had you seen him before?" put in my lady very pertinently. "Only once."

In answer to that I could do no more than give further assurance of my certainty on the point. "It was the man I saw in the boat at Greenwich," I declared positively. "Why should I imagine it?"

"All the same, I trust you have," she rejoined. "For if it was indeed that arch scoundrel we are undone."

"Imagination plays us queer tricks sometimes," Master Lindstrom said, with a smile of much meaning. "But come, lad, I will ask Dymphna, though I think it useless to do so. For whether you are right or wrong as to your friend, I will answer for it you are wrong as to my daughter."

He was rising to go from the room for the purpose, when Mistress Anne opened the door and came in. She looked somewhat startled at finding us all in conclave. "I thought I heard your voices," she explained, timidly standing between us and the door. "I could not sleep."

She looked indeed as if that were so. Her eyes were very bright, and there was a bright spot of crimson in each cheek. "What is it?" she went on abruptly, looking hard at me and shutting her lips tightly. There was so much to explain that no one had taken it in hand to begin.

"It is just this," the Duchess said, opening her

mouth with a snap. "Have you been with Dymphna all the time?"

"Yes, of course," was the prompt answer.

"What is she doing?"

"Doing?" Mistress Anne repeated in surprise. "She is asleep."

"Has she been out since nightfall?" the Duchess continued. "Out of her room? Or out of the house?"

"Out? Certainly not. Before she fell asleep she was in no state to go out, as you know, though I hope she will be all right when she awakes. Who says she has been out?" Anne added sharply. She looked at me with a challenge in her eyes, as much as to say, "Is it you?"

"I am satisfied," I said, "that I was mistaken as to Mistress Dymphna. But I am just as sure as before that I saw Clarence."

"Clarence?" Mistress Anne repeated, starting violently, and the colour for an instant fleeing from her cheeks. She sat down on the nearest seat.

"You need not be afraid, Anne," my lady said, smiling. She had a wonderfully high courage herself. "I think Master Francis was mistaken, though he is so certain about it."

"But where—where did he see him?" the girl asked. She still trembled.

Once more I had to tell the tale, Mistress Anne, as was natural, listening to it with the liveliest emotions. And this time so much of the ghost story had to be introduced—for she pressed me closely as to where I had left Clarence, and why I had let him go—that my assurances got less credence than ever.

"I think I see how it is," she said, with a saucy scorn that hurt me not a little. "Master Carey's nerves are in much the same state to-night as Dymphna's. He thought he saw a ghost, and he did not. He thought he saw Dymphna, and he did not. And he thought he saw Master Clarence, and he did not."

"Not so fast, child!" cried the Duchess sharply, seeing me wince. "Your tongue runs too freely. No one has had better proofs of Master Carey's courage—for which I will answer myself—than we have!"

"Then he should not say things about Dymphna!" the young lady retorted, her foot tapping the floor, and the red spots back in her cheeks. "Such rubbish I never heard!"

## Spring.

THE Spring is here! In wild wet wood
The primrose buds are showing,
And in the forest solitude
Blue hyacinths are blowing.
The cowslips hide in long green grass,
The violets scent the shadows,
And little laughing children pass
Where daisies star the meadows.

Now lovers walk along the lane
And linger on the highway,
And flowering grass grows tall again
Across the meadow by-way.
Again the cuckoo sings his song,
The full stream bends the rushes,
And all the orchard is a throng
Of blackbirds, wrens, and thrushes.

Now prisoned larks begin to sing,
The caged dove plumes his bosom,
And in town gardens wakes the Spring,
And scented lilacs blossom.
The blackened garden's narrow bound
Forgets how smoke has smutched it,
And blooms to an enchanted ground
Because the Spring has touched it.

And many a heart where sorrow lives
While earth's snow-garment lingers,
Finds that some flower of joy survives
The winter's cruel fingers;
And happy tears fall from tired eyes
On buds and blossoms vernal,
For winter dies, and sorrow dies,
But Springtime is eternal.

E. NESBIT

# RELIGIOUS PERSECUTION IN RUSSIA.

THE frontier of the Russian Empire lies only three days' journey from London, yet so few are the points of interest offered to the traveller in the vast regions beyond it, so disheartening the conditions of life, and so hampering to freedom the open suspicion of the police and gendarmerie, that few venture on an enterprise of travel where there is so little to reward them.

English travellers who enter Russia are of two kinds: well-born men of ample means, with a recognised position at home; and those whose object is of an exclusively commercial nature. The former are the lions of the *salons* in St. Petersburg and Moscow; they are fêted and caressed, and their eyes are deceived by the thin crust of French veneer that covers the surface of their surroundings; the latter, hurrying and pre-occupied, obtain a superficial knowledge of the sleek *bourgeoisie*, and of the vice and corruption of the cities. But neither of these classes of travellers can see deep into the conditions of life surrounding the peasantry; they can know nothing of the injustice, maladministration, and tyranny under which the people groan, or of that great fear of the "natchalstvo," or governing classes, which is so painful a feature in their lives. To illustrate this with any degree of fulness would require volumes; they would be volumes full of wrong-doing on one side, and of patient, blind endurance on the other; they would be records of hateful despotism borne with dog-like resignation, or rebelled against with criminal despair.

To only one branch of Russian affairs can attention be called now—to the hostile attitude of the Government and the Church towards freedom of conscience.

Within the past year public opinion in England has been deeply stirred by the reports that have reached us of cruel wrongs inflicted on the Lutherans of the Baltic provinces, and on the Jews of the south and west. The sufferers in both cases have appealed to Europe for sympathy and assistance, and their appeals have elicited such loud manifestations of disapproval of the acts of the Russian Government, that the position of the Germans has been in consequence considerably ameliorated, and enactments, which were on the point of enforcement against the Jews, have been either postponed or altogether shelved. Of course, the Russian Government, naturally enough, say, *audi alteram partem*, and bring forward material in support of their position, which, if trustworthy, would go far, if not to exonerate them from blame, at any rate to extenuate their culpability. But this is just the question. Is this material trustworthy? Has it been satisfactorily proved that the Lutheran pastors of the Baltic Provinces are quasi-politicians, anxious for the advance of German, and the downfall of Russian, influence in that territory? Or have we any sufficient evidence that the Jews of the south and west are a whit worse than their Russian neighbours, or that any other crime is theirs, save great ability, tenacity, and attachment to their faith and nation?

But there is yet another scandalous persecution raging in Russia, to which little or no attention has yet been directed. Its victims have neither a powerful neighbour like Germany, watching the progress of events and hampering the arm of the persecutor, nor a powerful European press and enormous financial influence at their back. Because they are Russian peasants, and poverty-stricken, and ignorant, and frightened, they suffer in silence, and their voice is not heard.

## THE PROTESTANT MOVEMENT IN THE SOUTHERN AND CENTRAL PROVINCES.

I take it for granted that the readers of this magazine know something of the origin and growth of the remarkable Protestant movement among the peasantry of the southern and central provinces of Russia. It is a movement which, although attracting little attention outside Russia, is yet full of deep significance. Beginning thirty years ago in a little German settlement near the Black Sea, this movement, or "infection" as the priests prefer to call it, has now spread into twelve provinces, and its adherents are numbered by hundreds of thousands. Fifteen years ago there was hardly a Protestant in the entire archbishopric of Kieff; to-day, in 150 villages the new heresy is at work. In the sub-district of Tarash there are now over 2,000 Protestant families. There are villages where they may be numbered by hundreds—one, for instance, where there are 350. The movement is so great, that the bishops of eight provinces are conducting a stern conflict against it; pillars of the church like the Metropolitan Platon of Kieff and Archbishop Nicanor of Odessa, are employing all their resources to destroy these enemies of the Orthodox faith; but, notwithstanding *every effort made to repress it*, the new protest is going steadily forward, and fresh recruits are flocking to its standards.

"Efforts made to repress it;" these are the euphemistic words employed by a high official to describe a system of persecution which has had no parallel in Europe since the days of the Reformation. It is extraordinary how much ignorance prevails on this subject. It is extraordinary that these unfortunate people have had no powerful voice raised on their behalf, to point out their sufferings, to point out how these simple and timid peasants—endeavouring to live pure lives modelled on the precepts of the Gospel—are harried and oppressed, wantonly and cruelly persecuted.

A bare recital of specific cases is, perhaps, the best way to bring this matter before English

readers. Declamatory writing about the iniquity of persecution for conscience' sake, and the beauty of complete religious freedom, is all very well in its way—no one has written finer things on the subject than certain Russian authors, high in the esteem of the Government—but plain facts speak more eloquently, and carry conviction more readily. My object is to bring before my readers specific cases of religious intolerance, to present in the simplest form what is actually occurring, by a recital of facts, to enable Englishmen to comprehend what their co-religionists in Russia can be made to suffer in the nineteenth century. It will be found that these cases require no comment to heighten the colours, or rather, I should say, to deepen the shadows, that the Russian St. Dominics are still at work, and that a plentiful crop of banished and persecuted heretics reward their labours. That I give all the cases is, of course, impossible; it is impossible even to give all known to me; but I shall choose a few examples from different parts of the country, taking care that these be as representative as possible of large classes of similar cases.

### BANISHED PEASANTS.

The first I shall cite is that of the peasant Tichenko, from a provincial market town. Were Tichenko in England, he would probably attach himself to the Primitive Methodists, as his views on doctrine and church policy seem to have approximated to theirs. At the instigation of his parish priest, he was charged before the divisional court at Kieff, with the offence of comparing icons, or holy pictur_s, to idols. The trial was held with closed doors. As far as I can ascertain, no account of what transpired appeared in the newspapers, but Tichenko afterwards informed a friend of mine of all that occurred. The president of the court argued the question with the priest and his victim, blamed the peasant for his temerity, and the priest for his harshness, and said he had no alternative but to punish the prisoner. He passed upon him, however, as light a sentence as possible: six weeks in jail, and a fine of eight roubles. The priest, not satisfied with the clemency of the court, complained to the metropolitan of Kieff; the metropolitan brought the matter before the governor of the province, and poor Tichenko on the expiry of his term in jail was "administrated:"[1] obliged to leave his home, and with his family to settle in one of the southern provinces.

The next case I will take is that of the peasant Makarinko, from the Kozilkov district. He is fifty years old, and has a wife and seven children. He was indicted for using disrespectful language about relics, for doubting the curative or medicinal efficacy of certain bones of saints. When called upon for his defence he seems, and well he might, to have been rather weak-kneed. "If the Batushka (priest) says the relics are wonder-working, very well, let them be so; I will say nothing against it." Nevertheless he was sent to Siberia in convoy with some forty others—thieves and reprobates of all sorts. His wife and family were permitted to accompany him, and it is well to think for a moment of that journey to Siberia, of the mental anguish and bodily discomfort suffered by that innocent family.

The case of the sergeant of the Reserve, Yegor Ivanoff, is of interest, as showing that even the army is liable to the Protestant contagion. Ivanoff was stationed in a little village of the Taurida, where the sectaries seem to have been of a very fanatical character. He was present when a few of them smashed an icon with a hatchet. Two of these iconoclasts were afterwards tried, and I believe exiled to the Caucasus. It did not appear that Ivanoff took any active part in this matter: his crime was that he did not take an active part in preventing the iconoclasm; that he was a sympathiser if not an accessory. For ten months he remained in prison untried. The trial was held at Izium, an insignificant town in the government of Charkoff. The prisoner was found guilty, and sentenced to banishment for life to Transcaucasia, with the loss of all civil rights. In the following May, as soon as the Kazbek Pass was sufficiently free from snow, this wretched Ivanoff tramped across the Caucasus in chains. Last summer I met him in T— and he described the hardships of his journey. He told me a sickening narrative of how the foot-sore prisoners were herded together in small and unventilated rooms, with absolutely no arrangements made either for their comfort or decency. He described a room twenty feet by fifteen, where sixty of them passed the suffocating hours of a May night.

### EXILES IN CAUCASIA.

It is to the government of Stavropol in Ciscaucasia that most of these "malefactors" are exiled. The Orthodox are relatively scarce there, and there is little danger of infection to any one but the Nogia Tatars, and the Kalmyks and Kirgiz of the Steppe. Their principal settlement is a long valley of tolerably fertile land called Gorkaya Balka, "Bitter Valley;" truly a bitter valley to many there who look back with longing to their old homes in Russia. Here are Protestants from all parts of Southern and Western Russia. One of them is the peasant Babienko, from near Kieff. His case was peculiarly hard. He seems to have been an indiscreet sort of man, and to have used inopportune times for the expression of his religious opinions. But the neighbours took the law into their own hands, and on more than one occasion sadly maltreated the heretic. He was shunned, beaten, boycotted, and his life rendered so miserable that he foolishly determined to complain to the provincial governor. As soon as the governor heard his story he simply issued orders for his arrest and immediate banishment to Ciscaucasia. There was no examination into Babienko's story, no attempt to do justice between man and man; there was only this tyrannical order, and the miserable persecuted wretch is compulsorily taken from his

[1] Administration is a power vested in governors of provinces and other high functionaries which enables them to get rid of "suspicious" people, either by sending them summarily to jail, or banishing them to some distant part of the Empire. It is an arbitrary power, and its exercise involves no legal proceedings.

family and home. But I expect he is one of those who do not find Gorkaya Balka so very bitter.

Both Cis- and Transcaucasia are full of little settlements of dissenters and schismatics of all sorts and conditions, who have been banished to those remote regions. Many of them are men for whom no sympathy can be evoked. Often attached to wild and impure doctrines, it is well perhaps that the simple and ignorant peasant should be freed from their contaminating influence. But the bulk of Caucasian dissenters, the Molokans, Dukhobors, Baptists, and others, are quiet, industrious, honest men, very considerably raised above the average *Mujik* in intelligence and the spirit of enterprise.

### SECTARIES IN SIBERIA.

Even in those far-distant provinces we have inquisition made into opinion, and exilings and banishment for conscience' sake. From Russia the sectaries are banished to Siberia and the Caucasus; from the Caucasus they are banished to the remoter parts of Russia. I will cite only one case out of many—that of the school-teacher, Emirchanoff. At an early hour of the morning when he and his family were asleep, he was visited by a police official and taken before the prefect of the city of Tiflis, accused of spreading Protestant doctrines among the Orthodox Russians. The prefect informed him that instructions had been received from St. Petersburg for his immediate deportation to a village in the government of Orenburg, a province contiguous to Siberia, and that until the authorities had made arrangements for carrying this into effect he was to go to jail. He asked to be allowed to see his wife before going to prison, but this was refused. In prison he was placed in a ward with some eighty common felons, and suffered the ignominy of being clad in the prison costume. When stripped of his own clothes he was shown a heap of cast-off prison garments lying in a corner, and told to select whatever might fit him. Emirchanoff describes these clothes as stained with filth, crawling with noxious vermin, and unutterably abominable. His nights were passed in an unventilated room, without beds or bedding, with some twenty others. He describes the fetid atmosphere of this den—a place only large enough to accommodate ten persons—the sickening stench, the abominable habits of his companions, the vermin, and he wonders he did not become insane. After ten days and ten nights of this disgraceful treatment he was allowed out on bail, and fourteen days after his arrest he and his large family were on the road to Siberia, escorted by a guard of police. These are specific facts, and they speak for themselves; comment only spoils such stories. There is, however, one rather important remark that I would like to make on this case, and that is that the man was altogether innocent of the childish charge brought against him. He and his family were doomed to all this ignominy, and suffering, and loss, on mere suspicion that he entertained or caused others to entertain opinions which some anonymous traducer considered heterodox.

I will now illustrate another phase of the persecuting spirit which has taken such fast hold of the Russian authorities, by citing the case of the three Protestant peasants, Anterstchuk, Nagorny, and Mojar, of the village Turbooka. The mother of one of these men had died, and they were anxious that she should be buried without the rites of the Orthodox Church. But, contrary to their desire, the body had been taken into the church, and the priest was about to begin a service for the dead when a disturbance arose, which was afterwards proved to be caused by one of the Protestants giving the priest a violent push. For the defendants it was alleged that they were simply protecting themselves from the violent conduct of the priest. Two of the five accused persons, on abjuring Protestantism, were sentenced to trifling terms of imprisonment; the others, whose names I have given, were sentenced respectively to thirteen, twelve, and fifteen years' hard labour in Siberia.

### THE PENAL CODE.

Before proceeding to narrate other painful instances of the barbarous persecutions to which Russian Protestants are now subjected, it will be well if I state the articles of the Penal Code on which the greater part of this nefarious action is founded. These articles, numbered 187, 189, and 196, form, however, only an insignificant part of numerous enactments for preserving inviolate the purity and unity of the Orthodox Church. Paragraph 187 deals with the "crime" of leaving the Church for another Christian community, and cites the punishment as loss of civil and personal rights and privileges, and transportation to Siberia. There is an alternative punishment for milder cases at the discretion of the court: work in a reformatory for a period not exceeding eighteen months. Article 189 treats of the crime of those who, either by means of preaching or writing, pervert orthodox believers, "although it be to join another Christian community," or who mislead people so that they join an heretical sect, or who induce others to join a dissenting sect or to embrace dissenting views. For a first offence the punishment is loss of certain personal rights, and imprisonment from eight to sixteen months; for a second offence imprisonment *in a fortress* from thirty-two to forty-eight months; the third offence entails loss of all rights and transportation to Siberia. Article 196 specifies the punishment for spreading or propagating the views of heretics or dissenters already sundered from the Orthodox Church, or for establishing the views of any new sect dangerous or hostile to the faith. This punishment is loss of all civil rights and transportation—from European Russia to the Caucasus, from the Caucasus to Siberia, and from Siberia to "regions beyond."

### SOME RECENT VICTIMS.

I will now continue my record of cases, which will still further illustrate the drastic nature of the measures taken against these harmless Protestants of the Steppe. Aksenti Rudakoff was a frail old

man of about sixty, living in the government of Orel. For twelve years he had been the "writer" in his native village, having been selected for this post because of his superior intelligence and good conduct. He had been, moreover, an irreproachable member of the Orthodox Church. But in time he became inoculated with Protestant ideas, and at once incurred the hostility of the village priest. The priest accused him before the district court of having embraced heretical tenets, and of perverting his own family and others. But his family and the others, when examined on oath, denied this, maintaining that they were still faithful to the Church. Were they still faithful members of the Church, or was their denial of the charge brought against them the inevitable result of their fear, part of the inevitable dissimulation and perjury ever attending religious persecution? Of course, Rudakoff was found guilty and banished to the Caucasus.

Ivan Golovtchenko, also a man of superior intelligence, was tried in Ekaterinoslav about four years ago on a charge of propagating the Protestant heresy, and was sentenced to three years' imprisonment. In May of last year he was about to be liberated, but it was first thought advisable to send an official message to his village priest to inquire if, in the priest's opinion, the return of the "convict" might result in the contamination of the villagers. The priest objected to his return, and the broken-down wretch, now joined by his family, was "administrated" to the town of Tiumin in Siberia. Three years in jail had left him and his family in utter destitution, and their sufferings from hunger on the road to Siberia, and after their arrival in Tiumin, were terrible. It was a kind-hearted Englishman, in charge of the steamers on the river Irtish, who pitied him and gave him an opportunity of earning his livelihood.

In the jail at Ekaterinoslav three heads of families are now awaiting a somewhat similar fate. They have just completed a term of eighteen months' imprisonment for becoming Protestants. Fearing their influence on his flock, the priest of their village refuses to permit them to return home. They will likely meet with Golovtchenko's fate—banishment to Siberia. Do we realise what all this means to these people? Apart from the physical discomfort and mental pain involved, it means leaving home and friends and land; it means selling the little properties gathered through years of thrift at great loss, and beginning all over again in a strange country, under police surveillance, and with an everlasting stigma of disgrace upon them.

I turn over my notes and come upon another group of woful cases. There are hundreds of them, but I select these. Seven heads of families in the town of Vitebsk have been recently sentenced to various terms of imprisonment, on a charge of having gone over to the Protestants. Four railway porters at Kharkoff, who had become Protestants, were suddenly, and without any notice, "administrated" to distant parts of the empire. It was the Bishop of Kharkoff who moved the civil governor in their case. Three persons have been banished by administrative process from Vladikavkaz, a beautiful little town lying below the northern foothills of the central Caucasus, for disseminating Protestant views considered hostile to the National Church. One of them, Bogdanoff, seems to have been exceptionally favoured: he had his choice of eleven different provinces, all of them, of course distant from Vladikavkaz.

In December of 1889, Piotr Boitchenko, a peasant of the province of Kursk, was taken before the divisional court accused of propagating Protestantism. He was sentenced to transportation to the Caucasus with the loss of all civil rights. From December until Easter he lay in prison, treated like an ordinary felon, and then, dressed in prison clothes, with one side of his head shaved, and bearing on his legs those terrible clanking irons whose gruesome sound one hears so often in Russia, he was forwarded across the Caucasus to his place of exile. Now what had this man done to deserve this ignominy and shame? Was he a polished swindler, who had deluded and ruined multitudes who trusted him? or was he a betrayer of innocent women? or a card-sharper? or a receiver of bribes? No, no; these sit in high places, and administer the law, and lead the armies, and rule the Bourse. But Boitchenko, and witnesses proved it at his trial, read the New Testament to his neighbours, and explained why no man should prostrate himself to an icon! For this, he tramped across the Caucasian snows, an exile in chains.

In Glukhi, a little town in the government of Mohileff, nine heads of families were tried for a similar offence, and had the same sentence passed on them as was passed on Boitchenko. Whether well grounded or not, I am hardly in a position to say, but there was a general impression at the time of the trial, that the judge had received his instructions to have the prisoners brought in guilty. The exclusion of the public from the court may have given rise to this impression, and the conviction on such flimsy evidence as was adduced only tended to confirm it. When sentenced, the prisoners were put in chains, and had one side of their heads shaved. But before this mock trial was heard, certain persons of the same district, against whom the evidence was exceptionally weak, were dealt with by administrative process. A person so treated was Leon Prematchenko, the presbyter or deacon of the Protestants: he was sent to Orenburg, and afterwards to Orsk, a miserable place on the confines of the Kirgiz Steppe. Before being forcibly removed from his house this unfortunate man was half murdered by his neighbours, in an outbreak of fanaticism.

The Orthodox are encouraged by the priests and police to inform upon their Protestant neighbours. The Bishop of Kharkoff has publicly asked the people of his diocese to lend themselves to this scurvy espionage. In this way, the police receive a good deal of information upon which they are not slow to act. In a large town in Central Russia five persons, one of them an elderly woman, are now anxiously awaiting the result of recent police inquisition into their religious opinions. Their neighbours informed the police that these people did not attend church, had no

icons in their rooms, and sang hymns when they had visitors. So the police took action, and cited them to appear before the "Sledovatyel." These "Sledovatyeli" are the examining magistrates, sharp lawyers accustomed to unravel the meshes in which cunning criminals involve their actions. To their wiles the Protestants, scorning subterfuge, fall an easy prey, committing themselves at every step. This old woman I have mentioned is accused of perverting her daughter, a girl of eighteen. She was cross-examined thus :

"You read the Gospels in your house?"—"Yes."
"And explain them?"—"Yes."
"And your daughter, of course, is present."—"Yes."
"She hears your explanations and remarks on what has been read?"—"Yes."
"And of course agrees with her mother?"—"Yes."

The examining magistrate, writing down all this, shows how views are held which have not the countenance of the Orthodox Church. He has now issued a command prohibiting the accused to leave their present residence, and informing them that they are to consider themselves *pod nadzorom politsii*—under the surveillance of the police.

### FINING THE HERETICS.

There are hundreds of cases where fining by administrative process is the method pursued to exterminate the obnoxious Protestantism. Let me narrate a few that are within my own knowledge. In accordance with the enactments of a little new law issued at his own initiative by the governor of one of the southern cities, the wife of a stonecutter, whose name I have, was fined one hundred roubles (£12) for permitting a Protestant meeting in her house. She petitioned the governor to remit the fine; he heard the prayer, remitted the fine, and as an alternative punishment sent her to jail for twenty days. In March last four persons living in a suburb of the same city were fined each one hundred roubles for a like offence. They were foolish enough to petition the Minister of the Interior to mitigate the punishment. The Minister replied through the police department that the matter rested entirely with the governor. The governor increased each fine to 300 roubles. In Romanovka, a suburb of Odessa, the wife of the Protestant Vilkhovsky was fined 300 roubles for avowed sympathy with the Protestant movement, and for permitting the heretics to meet in her house; and in Nerubalski, between March and May, five persons were fined for a like offence, one 100 roubles, three 300 roubles, and one 400 roubles. I am not sure if there is any mercy intended in the provision that enacts that fines may be commuted for imprisonment at the rate of twenty days for each 100 roubles. Wholesale fining has been proceeding for some time past in the Tarash district of the government of Kieff. Not only are those persons fined in whose houses Protestants meet, but every one of whom the police have had information that he or she attends the meetings are also fined. The fines are small, ranging from two roubles to ten roubles (5*s.* to 25*s.*), but as these people are in most wretched circumstances, they are unable to pay, and so go to prison. This sort of thing continued through all 1887, 1888, 1889, and 1890.

### PERSECUTION LITERATURE.

These tyrannical proceedings are supported by a considerable persecution literature. Scattered up and down the published reports of diocesan consistories, we meet with numerous complaints from the priests, that the power of the Church, unaided by the strong arm of the State, is utterly unable to cope with the growing heresy. The civil authorities are urged to take energetic measures to eradicate the "leprosy" which is so rapidly spreading over Russia and tainting the Orthodox believers. Fiery and envenomed letters are sent by village priests to their diocesans, full of malevolent slander against the Protestants, describing them as vile livers, as blasphemers, as revilers of everything sacred, and crying out for assistance in ridding the villages of their pestilent presence. I have a pile of this malignant rubbish before me, and feel sorely tempted to offer some specimens of what can still be written by professed ministers of the Christian religion. There is one "poem," entitled "The damned Stundist" (Protestant), that should not be passed over, as it bears on its last page Censor Kapustin's *imprimatur*, and the sanction of the ecclesiastical authorities in Moscow, and may be taken, therefore, as an authoritative expression of the attitude of the Russian Church towards Russian Protestantism. It has been scattered broadcast in cathedral and church in the diocese of Kharkoff. The invocatory opening is supposed to be sublime.

"Sound forth, thunders of the Church!
Discharge yourselves, curses of the Councils!
Crush with everlasting anathemas
The outcast Stundist rabble!"

And then through eight or nine verses the author describes the iniquity of these Stundists : how they have abandoned the traditions, how they shun the temples of God, revile the pastors, despise the icons, crosses, relics, and so on ; and giving as refrain to each of his verses, "the damned Stundist." The closing lines are :—

"Cruel and dark as a demon,
He shuns all faithful Christians,
And crawls into darkest corners—
The enemy of God, the damned Stundist.

"The thoughtless and harmless, who near
The den of this malignant beast,
Are befouled with blasphemies and slanders,
And cajoled by the damned Stundist."

Surely I have succeeded in revealing a state of affairs for which no parallel can be found since Reformation days. In describing it one retains with difficulty the forms of staid narrative ; we are tempted to hold out brothers' hands to those harried Russian peasants, and to denounce with no uncertain voice the atrocious system which inflicts such cruel and undeserved suffering on men whose only crime is their enlightenment and piety.

# NUMBER ONE.

BY THE REV. PREBENDARY HARRY JONES, M.A.

THOUGH reckoned as a numeral, "Number One" (when capitally printed) stands for a letter also, and thus there are two sets of suggestions connected with its presence and use. It leads us to think of the individual cipher in the row of figures, and the individual in the ranks of men.

Look at it first as a cipher. How it belies the metaphorical meaning attached to this word. We say of a man "He is a mere cipher"—*i.e.* of no value. But though the numeral "Number One" may be indicated by only a single stroke of the pen, it is of the most importance in the whole family of figures. It leads the long procession of arithmetic. Without it there can be no No. 2, no sum, no computation whatever. Merchants, mathematicians, and astronomers need it as much as the savage who makes his simple calculations by means of the fingers on his hand. It is soon counted, but unless it be counted no total can be reached, no balance struck. The value, however, of "Number One" is not seen chiefly in its arithmetical use. It concerns all things, material and moral; all accounts, financial and religious; it belongs to both the Bible and the ledger. If it recalls to us the invention and employment of *numerals*, whereby man's advance into civilisation is denoted, if it affects his commerce, if it marks his measure of most things taken and registered, it also reminds us of the unpenetrated cloud which hides the great beginnings in the Kingdom of God. When and whence came the first created heaven and earth? Think of the pains and time which have been spent over the questions associated with this inquiry. Throughout all literature and records of science, in all books that have been written since the Lord asked Job "Where wast thou when I laid the foundations of the earth?" down to the publication of Darwin's book on the origin of species, the place of "Number One," and the problem of its existence, have exercised and baffled the ingenuity of man.

Men of science and theologians have strenuously occupied themselves with the investigation of "Number One," and it must be said that they are all, if not at fault, yet at a standstill, with no blame to them, but with sheer incapacity to decide the matter before them. For instance, however we account for such and such phenomena or results, saying that they come from the operation of certain laws, we are checked when we attempt to say how these laws originated. Men may protest against the theological theory of separate acts of creation, and assert that the many-branched family of living creatures came from some far distant germ, which was their common ancestor; but whence came the ancestor? According to all evidence and theories we are moved back into the past towards the primæval "Number One." But where and when shall we find it? What was this potent atom of *life* which has sent its energy through the unended ages? When and how did that vital impulse begin to act which has quickened the past, sustains the present, and holds the still more inscrutable future in its unseen hands? Think of the conjectures that have accompanied and the darkness which has shrouded this "Number One," the unfolded and incalculable efficacy of which makes its origin the great marvel of existence. Glibly as we use the word "creation," the thing itself, the "Number One" of material being and created life, steadily baffles conjecture and research. None can comprehend—that is, take in the full truth—about this primæval fact. The man of science, whether professedly Christian or not (though there are masterly scientific minds which are moved with reverent faith), and the simplest unlettered believer are alike unable to define the first foundation of the house through which man was eventually to pass on his way to another city by the same Builder and Maker. Happiest is he who is content to say, without bewildering and abortive struggles to define his words, "In the beginning God created the heaven and the earth;" and when all is said and done, to use from his heart the last words of the Perfect Man, the Son of God, "Father, into Thy hands I commend my spirit."

The same feeling comes to us when we pass from thoughts about the first material of creation to the springs of those rivers of speculation, those streams of conjecture, which have ever flowed through the world of mind. They are equally inscrutable. There appears an august and stupendous "Number One" in the questions asked always, everywhere, and by all who think, about the origin of evil. What is it? Whence comes it? When did it begin? Who tempted the first tempter of mankind! Happiest he who can see in Him whom Christians call the Perfect Man a door of exit from disorder, a saving relief from the mean throng of selfish desires, a strong rock amid the rain and floods and winds which descend and blow in the world of men, trying the hold we have upon Him and His words of truth. Happiest he who, though beset by curious inquirers, or by those who scoff, can yet say with St. Paul, "Brethren, I count not myself to have apprehended; but this one thing I do, forgetting those things which are behind, and reaching forth unto those things which are before, I press toward the mark for the prize of the high calling of God in Christ Jesus."

Into such regions of thought, high, but incessantly pressing upon us, seemingly far off, and yet near to every thoughtful mind, are we led as

soon as we begin to see the graver significance which is attached to the common words "Number One."

Let us now descend, and ask how they are concerned in things more within our reach.

"Number One." Perhaps this first touches the value of invention. Of what supreme initial worth was the earliest of some things which are now common! Think of the ease in locomotion, and in the carrying of our loads, which began to come to pass when some man invented the wheel and axle. The conduct of ordinary life was then revolutionised. Labour, it would seem, was about to be incalculably lessened. We may be sure that the first wheel and axle, however rude, was soon hailed by primæval man with glad comments in whatever language he then spoke. In it we may be certain he thought he saw some deliverance from toil, and presently, when he came to harness submissive animals to his cart, a still further escape of man himself from insistent labour. Alas! let me parenthetically ask how many of these successive inventions have eventually brought the relief which they promised to bring? How often have the sanguine hopes of toiling weary man been baffled by the failure of science to lessen his toil? But we cannot now investigate the slavery of civilisation. We are concerned in the history of "Number One," and are at liberty to conjecture the effect produced by the first made and used of some now common things.

We wonder how the world could (as we say) have got on without them. Think, for instance, what a change came when man lit a fire for the first time. These thoughts might be pursued far, and a long catalogue made of so-called indispensable things, to each of which, however, there must have been a "Number One."

The curious reflection comes with them that some improvements and discoveries which are seemingly obvious were very slow in arriving. Take one which was long coming to pass, in the art of writing. Men wrote with pen and ink time out of mind. We have all seen (perhaps in some museum) old yellow parchment manuscripts inscribed with beautifully-written antique characters, and recording some matter of great importance. And yet, though in spoken language we pause between words, many of these ancient documents admit no break between them.

The words are, of course, all consecutive, but they touch one another. The writer never thought of making the reading of his writing easy by doing with the pen what he always did with the tongue—*i.e.* making a slight pause between contiguous words. How strange it is that such a simple thing should not have occurred to a scribe engaged in writing all day long!

What a relief it was to readers when for the first time he wrote as he spoke! I refer to the delay in the arrival of this seemingly obvious "Number One" in order to suggest that probably there are now some things in the common processes of life which, when perceived, will be greeted with astonishment at not having been discovered before. They are still hidden.

It is the same with unquestionable reforms—social, religious, national, domestic; reforms of which none disapprove when once the need of them is perceived.

Just as we hold up our hands in astonishment at the blindness of our predecessors, so those who come after us may be astonished at our incredible want of righteous perception. Though we are thankful for the march of philanthropy which has made much that was once common impossible now, depend upon it the day will come when every right-minded man will be amazed in learning how some things were ever possible with which we are now content, and in which only a few inglorious reformers have as yet seen anything to complain of. There are "Number Ones" in the progress of human life and in the perception of righteousness which this generation has hardly suspected. It is not of material inventions alone that I now think, but of an opening of men's eyes to the anomalies, evils, wrongs, and displays of degradation or vice which we tolerate now, but which ought to make us go all the day mourning.

Some of these are so generally accepted as hardly to appear evil to many who are familiar with them. Take one example. We read in prophetic language of the time when none shall hurt nor destroy in God's world. A favourite hymn now sung by Christian congregations says, "Thy kingdom come, O Christ—when comes the promised time when war shall be no more?" Now, could we move ourselves onward into that distant period when far future descendants sit in judgment on the days gone by—that is, on our days—might we not see them amazed at learning that some two thousand years after Christ, the Christian nations in that part of the world where Christianity had been longest taught and professed had provided no court of international law, but had kept some millions of men always ready armed to settle their differences (real and imaginary) by the edge of the sword?

I might give other illustrations of the surprise which might be felt at a state of things which prevails so widely now that even the most conspicuous Christians of our age have been concerned and exercised in it without any popular protest, or even perception that there was anything contradictory between their faith and their works, their religious profession and their business in the world.

You might find other examples of accepted procedure which will some day be condemned; you might find them in the wearisome processes of law, you might find them in ecclesiastical abuses, as they are called, venerable, mischievous, and stubborn; you might find them in the attitude of Christian churches towards one another; you might find them in some commercial custom followed without hesitation; you might find them in the degraded condition of many among the poor.

I would now make another use of "Number One;" and in so doing not speak of national imperfections, but the conduct of personal life.

"Number One." Think of the first step in wrong-doing. In the history of how many a one could the finger be laid upon a particular offence, perhaps some seemingly slight divergence from that which was felt to be right, and of which we could

say, this was your fatal "Number One" which led the way to grievous transgression and disgrace; this was the beginning of sorrow and shame.

On the other hand, many may thankfully look back to a "Number One" when the neck of a bad habit was broken for the first time. There are some, however, who have not got thus far. They see the habit. They know that it is bad. And a man in this condition has said to himself, "I will get clear. I will give it up." And yet the stubborn old offence, vice or custom, stands where it did. "Number One" in the actions of a better life has not been reached.

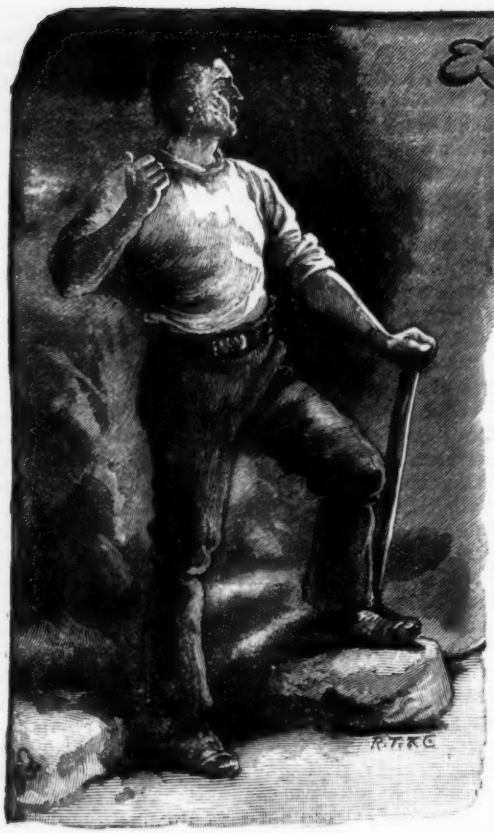
The French have a proverb to this effect, "It is the first step which costs." And it is a very true one. There is nothing easier than for a friend to say, "Make a beginning;" but that is one of the hardest things to do. Still, it has been done, and with anyone who breaks away from a vice or evil custom it has to be done again. And there is this difficulty in, or rather drawback to, it.

Recollecting what an effort the first act of reformation required, the man fancies that the same will be needed for the next; and so the prospect of a long strain or succession of struggles haunts him. He forgets that each blow really drives the nail further in. A half-completed work is labour lost. It is the last half which makes the whole, which builds the bridge, or bores the tunnel through the hill. What would the house be without the roof, or the most finished and costly watch without its hands? It is the completion, the full sequel to "Number One," which gives it its true value.

Here an English proverb hits the right nail in saying, "Once is never." "Number One" is omnipotent when it leads. But if nothing follows it, not even a "number two," it shrinks into the meanest of ciphers. As we thus look at our subject fresh illustrations of it occur to our minds.

When the "Number One" of any course has been reached and followed, we perceive the importance of its character and direction. How much has gone wrong because of the haste, carelessness, or ignorance which marked its birth or beginning! We talk of a man having had a bad start in the world, or of some promising process which goes awry because it was begun wrongly. But "well begun is half done." Thus we avoid false starts, mere flashes in the pan, ill-considered experiments, which begin and end in themselves.

There is an excellent proverb, first cousin to those I have already quoted, and it is this: "One man, no man." This does not forbid or deprecate the lonely thought which may produce a revolution in science, as when Galileo watched the swinging pendulum or Newton saw the apple fall; it does not lessen the value of the courageous solitary protest which may check iniquity, the first brave speech or action, the wholesome daring which may challenge some pernicious but highly respectable custom.



It rather points to the mystery of force which lies in fellowship. The saws, sayings, and maxims about this are, we know, endless. Union, combination, is the secret and instrument of social, national, political, and religious strength. Trouble, depression, suffering of one kind or another, may affect a whole class, a whole trade, a whole section of society, such as matchmakers or needlewomen. And many good people may exert themselves to remedy it by relief of one sort or another. But all this help mostly comes from the outside, and helps only so long as it is so applied. The moment it stops, the evil is as bad as ever. But when the oppressed combine, when they are no longer like a heap of sand, but hold together, there is the best promise of rise and recovery. Then they aid one another in the best way. This union, moreover, which is true in what we call temporal or worldly matters, is especially true in those which are considered spiritual, for without it no one can realise that central fact of Christianity which makes it practically human—that we are every one members one of another.

Here we reach the consideration of "Number One" as a capital letter. And by it we commonly understand "Self." With most, self is the prime "Number One," of whom they chiefly think or take care. Here again comes in the proverb, "One man, no man." For he who thinks only of himself, and makes his own interest the touchstone of every proposal and test of every act, is the very worst example of "Number One." He lacks the true mark of Christianity, and indeed of humanity. He who moves among his fellows, never weeping with those that weep, nor rejoicing with those that rejoice, never lending a hand except for his own profit, never giving except for the hope of gain, never helping except to put another under obligation to himself, is in the deepest sense "no man." He is never loved, missed, nor mourned.

One word more about "Number One" as a leader among men. He is inevitable. There must in all movements be a first, and yet herein is a danger by no means rare, especially, perhaps, in these days. For however excellent hero-worship may be, it may lead to a loss or weakening of our own individuality, which is sacred.

No man may deliver his brother, nor make agreement unto God for him. However united a society may be, however much we may see and enjoy the value of fellowship, it is no paradox to say that each one lives alone, though he moves in the midst of crowds. We cannot shuffle off our personal responsibility. The temptation to do so is manifold, incessant, and strong. Some, *e.g.*, are tempted by the hope of intellectual relief to join a religious community which offers to settle spiritual difficulties for them. There is unquestionably great charm and comfort in such a surrender of conscience. Hereby, however, faith or trust may pass into that credulity which changes us from men into counters on a board, moved by the player's hand. This devotion, this facile yielding of ourselves, is not human, however gratifying to the leader and the led. Gratification is not the chief aim of a man's life. We were not sent here merely to study comfort of any sort. Though no one liveth or dieth to himself, he has to answer alone for his words and acts to his own conscience and his God. And when all is said, it is thus only that he can take the best care of "Number One."

# EVERY DAY LIFE ON THE RAILROAD.

"Well, chaps, we shall never get out of this alive, so we may as well go on with our bit while we live."

## THE ROAD.

IT takes a good road to stand three hundred tons pounding over it every few minutes, at fifty miles and more an hour. Stand on a bridge, and look down on a railway. See the four bars, planished by the heavily-weighted wheels, gleaming in the sunshine, and stretching away till they almost meet in an apex in the distance. There is not a weed or fragment out of place to break the monotonous floor of ballast. All is as clear as if newly swept. Were the railway under glass it could not look tidier. To keep 17,000 miles of line as clear as that is not an easy task. What a number of sources of rubbish there must be! Even the vegetation is a serious matter, although nothing like what it is in warmer climes; in South Australia, for instance, where it costs £16,000 a year in merely weeding the permanent way.

The keeping of the permanent way up to a high standard of efficiency is a most important matter in railway management. On a great line like the North-Western there is a man in charge of every mile of single track, or rather there are three men and a ganger to every two miles of double track. Over every ten or so of these gangs there is an inspector; over every seven or eight of these inspectors there is a chief; and so many of these chiefs are responsible for a division, in charge of a civil engineer. Every day every foot of the track is gone over, and carefully examined, and it is by the gangers and their platelayers, together with the artisans of the division, that the works of the line are kept in repair. A humble task is that of a platelayer, but if his work were done in a slovenly manner there might be serious loss of life.

A railroad is always in danger. Rain and wind may damage embankments, rain and frost may cause landslips and block the rails, mining and brine-pumping may cause subsidences, wind and flood may cause bridges and viaducts to slip and settle, carriages and trucks may break down, cargo may fall overboard. And all these things come in the ordinary day's work. In the extraordinary day's work comes a disaster like that at Llandulas, where, in a Sunday storm, a viaduct was washed clean away, and a break made in the traffic between England and Ireland. Here was a state of affairs requiring all the strength of a great company. Within the week the line was taken half a mile inland, so as to cross the river over a temporary trestle bridge, being cut in the slope of the old embankment and run in places upon stacks of sleepers so that there might be no settlement under the heavy traffic. Down to the bridge and up again the gradients were 1 in 23—a nice task for heavy trains, some of which took three engines to get them over! Yet the working went on without breaking the couplings or heavily bumping the carriages together; no mishap occurred, and "the passengers in the train were scarcely aware that they were travelling under unusual conditions." Meanwhile the new viaduct was in progress, and it was opened within the month, its forty two girders, each thirty-two feet in length, having been rolled and worked at Crewe within a week.

The North-Western is the only company that does all its manufacturing, from rolling its own rails up to fabricating artificial limbs for the injured members of its staff. Crewe has been often described: not so very long ago it was described in this magazine, and, like the making of the steel, the rolling of the rails, and the building of the carriages—which we have seen together[1]—it can have no place

[1] See "Leisure Hour" for February and March 1888, and May 1890, and the volume "Foundry, Forge, and Factory," published at our office, price two shillings.

here. No carriages are built at Crewe, but almost every other branch of railway work can there be seen in progress, and among the unexpected things is the making of steel sleepers. The sleeper of to-day is of wood; the sleeper of the future is to be of steel or a steel alloy, to resist an acid atmosphere.

The M. S. and L. does not "pickle" its wooden sleepers, but nearly all other lines do. We hear of sleepers being "kyanized," or treated with corrosive sublimate; "burnettized," or treated with zinc chloride; "boucherized," or treated with copper sulphate; "vulcanized," or heated by steam and compressed; and "creosoted." In this country we generally "creosote."

If the traveller by the Great Western will glance south of the line as he crosses the canal at Hayes, he will see what looks like a gigantic box of bricks, laid out in towers, and tunnels, and bridges, and cubes, just as if some boy had been amusing himself playing at railway stations. This huge timber-yard, in which all the timber is of one size, shape, and kind, tails off into what looks like tar works, and it is in these tar works that the "pickling" is done. But the Great Western sleeper yard at Hayes is a small affair compared to the Midland yard at Beeston, where a quarter of a million sleepers pass through the pickling process every year.

A sleeper is, nominally, nine feet long, really it is an inch shorter; it is ten inches wide, and half as thick. The first thing that is done to it is to put it into a machine, which bores in it the holes for the bolts and trenails. As all these are done at once, there can be no variation in distance, and no doubt as to gauge. Then the sleepers are piled up on a truck in a circular stack, and six of these trucks, containing about three hundred altogether, are run into what looks like a gigantic boiler. As soon as they are in, and the big tube closed, the air is pumped out, and into the vacuum the creosote flows: then more creosote is pumped in under a pressure of 120 lb. to the square inch; and when each well-conducted sleeper has absorbed two gallons and a half into itself, the pumps are shut off, and the pickling is complete.

On the North-Western the creosote driven into the wood is half as much again, and the block complete as laid on the ballast weighs 160 lb. To each sleeper there are two cast-iron chairs, each weighing 45 lb., which are fastened in by two iron spikes and two galvanised iron screws; and between the chair and the sleeper is a layer of hair felt. There is a sleeper to every yard of track. Concerning these chairs we might say much, but not now. At Derby one of the sights is the casting of chairs in a large shop specially devoted to the purpose. It does not take long to make a railway chair; a man can turn out one a minute without exerting himself over much. There is the wooden mould with the brass clips for the returns; down goes the mould, in go the clips, round goes the sand, out comes the mould, in goes the metal, there is a little smoke, a little flame, and the chair is complete. Like everything on a railroad it is of special design. Rails, chairs, fish-plates, bolts—everything on the line differs in some slight degree from what is used by other companies.

A very casual glance will show that each line differs. The Great Western track from London to the West has its three rails, the extra one being for its broad gauge traffic. The Great Northern lays its inner and outer rails alternately, so that the sleepers come at equal intervals; it also banks up its ballast so that little more than the top edge of the rail is visible. The Great Northern itself is not a large affair; it is its connections which give it so much importance. On the main line it goes no further north than Shaftholme, just outside Doncaster. There the North-Eastern metals begin, which stand clear out of the ballast, as the traveller to the north is only too well aware by the increased noise made by the carriage as it rushes over them. The Great Western was originally laid on longitudinal sleepers; a plan which did very well on the level but did not answer satisfactorily on a gradient, owing to its keeping the rail too rigid; for, strange as it may seem, the very slight amount of spring between sleeper and sleeper gives the wheels a firmer grip and helps the train to climb. Where steadiness is an advantage, as over bridges and viaducts, longitudinal sleepers are still used; and for the same reason rails are used of extra length. On the North-Western there are ten miles of line laid with sixty-foot rails.

But we shall never get away from these sleepers, and chairs, and rails; and seemingly it requires an effort to avoid remaining in permanence on the permanent way. We have said nothing about the ballast, which has cost probably £400 per mile, and which on the Midland at any rate is sixteen inches deep in the middle of the six-foot; and, most important of all, we have said nothing about the road on which all this gravel, and wood, and iron, and steel are bedded.

A perfect road is level and straight, like that of the South-Eastern between Tunbridge and Ashford; but a country like the Weald is not to be found every day, and the engineer has to keep as near as he can to the ideal. In laying out a road it would seem to be the simplest plan to have one long arc springing from the termini and passing through the highest level; but an arc of that nature, over an undulating country, is economically impossible, and it has to be cut up into subsidiary gradients, the object being to run these at such an average that the material removed from the cuttings will suffice to form the embankments. At the same time the general slope of the line, taken as between its highest and lowest points, is of considerable importance to those who have to run trains over it, and under the name of the ruling gradient it figures in many a discussion.

When George Stephenson laid out the Liverpool and Manchester, the line he floated on brushwood over Chat Moss, the ruling gradient he worked to was 1 in 900; the Birmingham and London line, which followed, could not be run to so flat an arc, and the Stephensons could do no better than 1 in 330; the union of these lines by the Grand Junction gave us the London and North-Western, which has the best road running out of London to the north.

And yet, between Euston and Crewe, the North-Western has only 14 miles of level line out of the 158, though, curiously enough, on the 141 miles between Crewe and Carlisle there are 18 miles absolutely level, but of course these miles are not continuous. Throughout the distance from Euston to Carlisle there is rather more than a mile of curve to each mile of straight, the percentage of straight being 49. South of Crewe the steepest gradient up which the North-Western trains have to climb is 1 in 177, but through Cumberland they have to toil up 1 in 75 at Shap, and go over a summit of 915 feet, after several minor ups and downs; and yet through 50 miles of hills, their average speed is 48½ miles an hour, every ton of engine finding a sufficient load in two and a half tons of passenger train. North of the Border the Caledonian, which continues the North-Western route in Scotland, rises to over a thousand feet at Beattock, and dropping to 250, rises again over 880 before it reaches Edinburgh.

Its rival in the Scotch traffic, the Great Northern, has a worse road in the south and a better one in the north. Its ruling gradient is 1 in 200, and its summit is at Stoke, just a hundred miles from London, where it attains a height of 427 feet. From Shaftholme to Berwick its trains run on North-Eastern metals: between Berwick and Edinburgh they run over the eastern branch of the North British, the summit of which, at Grant's House, is only 367 feet, being 648 feet lower than the Caledonian.

The third road from London to the north is the Midland. Being the last comer it has had to take the best route that was left, and make a feature of its picturesqueness. Out of London it rises to Elstree; it runs from thence down and up to Leagrave, 367 feet; drops down to Bedford; crosses the Ouse seven times in seven miles; and rises 50 feet in a mile, and runs through cuttings 50 feet deep and over embankments 50 feet high till at Desborough it has climbed 435 feet. But this is nothing to what it accomplishes in the Lake country. There it climbs 1 in 100 for 14 miles, passes through Blea Moor tunnel at a height of 1,150 feet, drops with a run and rises again until it reaches its summit level of 1,167 feet at Aisgill. This is 252 feet higher than the North-Western and 740 feet higher than the Great Northern, and is the greatest height attained by any railway in England, except the Tebay branch of the North-Eastern, which goes over 1,320 feet at Stainmoor. The Midland reaches Edinburgh by means of the Waverley branch of the North British, which runs by Riccarton and Melrose, and varied by a most difficult combination of hills and curves, rises to 1,000 feet at Hawick, and to 900 again north of Galashiels.

A very different road is that of the Great Western main line, which Brunel laid out so as to be as nearly flat as possible. Its summit level is at Swindon, where the line is only 270 feet above what it is at Paddington. The ruling gradient is 1 in 1,320; in fact, the line is practically level all the way to Exeter, the only noticeable descents being between Wootton Basset and Dauntsey and at the Box tunnel, where it drops 1 in 100 for about two miles. Between Exeter and Plymouth the road becomes much more curved and varied, and before it reaches Penzance the curves, and banks, and astonishing viaducts, become so numerous as to preclude any speed worth mentioning.

The London and South-Western has a much less favourable road to work. It is a line of long gradients and huge embankments. From London to Basingstoke it is fairly level, but beyond there the climbing begins, one bank, rising 1 in 250, being 17 miles long. At Lichfield, in the Hampshire ridge, the line is nearly 400 feet above the level of the rails at Waterloo. Between Southampton and Ilfracombe a level straight road could hardly be expected, though the engineers were more fortunate on that route than on the Portsmouth Direct, where circumstances led them to climb 460 feet up to Haslemere.

There is nothing on the South-Western like the thirty miles dead level which the Great Eastern possesses north of Cambridge, nor has it anything like the series of gentle ups and downs that mark the whole of the road from Liverpool Street to Norwich. What the Great Eastern suffers from is not a crippling ruling gradient, but inadequate approaches for its enormous suburban traffic. As a contrast to it in many ways we may mention the struggling Chatham and Dover, which has the worst road out of London. For twenty-seven miles it runs up and down, chiefly up, to Sole Street, then it undulates, chiefly down to Canterbury, up again it goes to Shepherdswell, to come down again to sea-level at Dover. Unfavourable as this road may be for quick passenger traffic, it is not nearly so bad as that of the Manchester, Sheffield, and Lincolnshire, and yet on the M. S. and L. there are more expresses than on any other line in the kingdom. If the Chatham has the worst of the London roads, the Brighton has the best. Beyond gentle rises to each of its three tunnels, Merstham, Balcombe, and Clayton, and short inclines up to Grosvenor Road and Balham, its track from Victoria to Brighton is practically level, and has nothing about it to prevent "five miles an hour easy" being added to its fastest running when its dividends begin to drop.

But something should be said as to the way in which these roads were made. An innings must be found for the navvy. Between Dore and Chinley there is now making one of the most difficult lines in England. It is only twenty miles long, but it will cost more than a million of money. This will soon give a third road through the Pennine Range between Sheffield and Manchester. Through that range on the same errand there first went the M. S. and L., who drove through it the Woodhead tunnel, 5,297 yards long, which at the time was the longest in England—a terribly hard piece of work mostly through millstone grit, in which 157 tons of gunpowder were used for blasting; and differing from other tunnels in being in duplicate, one bore being for the up traffic, and the other for the down. On similar thoughts intent—the thoughts of sharing in the Sheffield and Manchester trade—came the North-Western, who went through the ridge by the Stanedge tunnel of 5,342 yards, which, by eclipsing the Woodhead, be-

came the premier tunnel in England, until that under the Severn, 7,644 yards long, put it very considerably in the shade. And now, here is the Midland, by its branch from Dore to Chinley, going through the same ridge as the North-Western and M. S. and L., and that by a tunnel 6,100 yards long. This huge bore, which is under Longshawe Moors, opens into the valley of the Derwent; and no sooner has the new line crossed that picturesque stream than it bores again for 4,000 yards through the limestone of the Peak to join the main Midland to Manchester, a little north of Chapel-en-le-Frith.

This second tunnel ranks only next to the Woodhead in length. Next to it comes Bramhope, 3,745 yards, on the North-Eastern, followed by the Medway tunnel, only five yards shorter, on the South-Eastern, the next being that at Sevenoaks on the same line, which measures 3,600 yards. The Box tunnel on the Great Western is only 3,227 yards long, but it is one of the wonders of the West, as those who have visited the quarries and walked into it can testify. Unlike other tunnels it is not lined throughout, owing to the exceptional nature of the rock through which it is driven. Where the fuller's earth and clay are met with there is the usual state of things, but in the freestone beds there is a huge cavern half a mile long, forty feet high and thirty feet wide, roughly shaped as a Gothic arch. The dip of the road is from east to west, the dip of the rocks is from west to east, and there, at a gentle slope, they stand in huge joints and strata, rising as on corbels to the under side of the uppermost visible bed, which has been left as a flat narrow roof.

Very differently do we think of tunnels now to what our fathers did when this at Box was made. Then the plunge into the hill was deemed to be so prejudicial to health that doctors advised their patients on no account to adventure it. And in Yorkshire the feeling against travelling underground was so strong that a commission of medical men was appointed to inquire into the effects on the human constitution of "the Leeds, and Selby, and other tunnels."

The most remarkable tunnel in this country is undoubtedly that under the Severn, giving the Great Western a short cut to South Wales, under an estuary where the tides are higher than at any other place in the world, except in the Bay of Fundy. The story of this tunnel has a volume to itself, and well it deserves it. The works were started in 1879, but the water broke in, and a panic seized the men, who fled, leaving open the door that was there for them to shut when an inrush took place. Then followed such a pumping as the world had never seen; and all in vain. Evidently nothing could be done till that open door was shut; but to shut that door the diver had to walk a thousand feet from the shaft, dragging his air-hose with him, go behind the door, which opened inwards, shut down a flap-valve upon an eighteen-inch pipe, come back through the doorway, pull up two rails of the tramway, close the door, and screw down a twelve-inch sluice-valve. As no one diver could drag such a length of hose after him, three men took the job in hand. One stood at the bottom of the shaft, one five hundred feet up the heading; the leader going on to reach the door. Groping his way past upturned skips, and tools, and masses of rock, which had been left in the panic, he got within a hundred feet of the door, and then found it impossible to drag the air-hose after him, owing to its rising to the top, and grinding against the roof. Sitting down amid the dark waters, he hauled up a length of the hose and went on; and thus for a time in short lengths did he advance, to find it impossible to get far enough. But he was to succeed after all. Abandoning the air-hose, and wearing a knapsack of compressed oxygen communicating with a mask over his face, he succeeded in reaching the doorway, and pulling up one of the rails. Two days afterwards he went again, and shut the door. Then the pumping recommenced, and the water slowly sank, the slowness being accounted for by the fact that there were two valves, one with a right-handed screw, and one left-handed, and Lambert, the diver, not knowing this, had screwed both tight to the right hand, so as to shut one sluice and open the other.

Then the real work began, but the difficulties were great. Once again the water burst in, and Lambert, who had been out to Sydney to help raise the Orient liner, "Austral," had again to shut a door; and then the tidal wave came in; and then the snow choked the approaches. But the work went on. A town grew up round the tunnel mouth, with hospital, schools, and music-hall complete, for the men and their families. At last, by steadily pumping twenty-three million gallons a day, and by using 76,400,000 bricks, and 36,794 tons of Portland cement, the 3,628 men succeeded in seven years in completing the longest and driest tunnel in this island.

If the Severn is our best tunnel, the Settle and Carlisle is our most remarkable line. It is just over seventy miles long, and it took over seven years to make, and cost over three millions of money. When it was being staked out the engineer and his men were snowed up in the Blea Moor inn. For three weeks the snow fell continuously, until it lay seven feet and a half thick, and it was only by driving a tunnel through the snow to the road that the men, who lived on a stock of eggs and bacon, got water from the horse-trough to drink. The making of the line was a very war with the giants. Along its whole length there was not a level piece of ground big enough to build a house on, and its embankments, cuttings, and tunnels had to go over or through almost every variety of rock known to the lithologist. In the southern part of it is a section through boulder clay, the most unsatisfactory of materials for the engineer—one hour a thick soup, only removable in buckets, the next a stubborn rock; one day so hard as to require blasting by gunpowder, the next, owing to a shower of rain, a mass of glue. Further on is the real tough rock of the outlying flank of Whernside, Blea Moor, where 2,000 men were engaged for four years or more on embankment, tunnel, and viaduct, the wind being at times so high that the bricklayers could not work for fear of being blown from the scaffold.

In driving the first heading for a tunnel, only

four men can work in one place; now the greater the number of faces on which they can work, the more quickly is the heading driven; and hence not only is the heading bored from each end, but shafts are dug down from the top, each shaft giving two more faces to work at. At Blea Moor there were seven shafts, some of them of 500 feet and more, and thus an opening was made for sixteen gangs of men, night and day, four of the shafts being eventually left as ventilators. Once the heading was driven, the "breaking up" was started on, that being the enlargement of the hole sufficiently to allow of the arch being put up in brickwork, the space behind the brickwork being filled in with loose rock. Then the excavation of the tunnel was continued down to the level of the rails, and the sides and floor put in. In all this work much gun-cotton and dynamite was used, and as this could not be sent by railway, it had all to be carted from Carlisle or Newcastle, at a cost of £200 a ton.

The next great tunnel to Blea Moor is that at Black Moss, and north of that is Intake Bank, where for twelve months the waggons daily tipped their contents without the embankment advancing a yard. Chat Moss was bad enough, but Intake Bank holds the record amongst railroad absorbents.

Solid as an embankment may look, it has its peculiarities in weakness. All embankments suffer more or less from "nerves." In even the solidest, the vibration of a fast train can be detected a mile and a half off. Strange stories are told of embankments. At Wolverhampton there is one which suddenly began to smoke, and burnt for days, owing to the iron pyrites in the material of which it is made. At Hanwell, on the Great Western, the embankment was not on a sufficiently wide basis, and it burst right through the layer of clay, so that it took more material to repair its damages than had originally been used to make it. A serious matter is this of vibration. Some say that the vibration spreads farthest in the direction of the earth's rotation. A curious theory; though it is certain that on railroads the western rail wears out faster than the eastern, owing to the earth's motion pressing down one side of the train harder than the other.

North of the Intake Bank is the Birkett tunnel, wherein there was once a fall of rock which left a cavity sixty feet high to be dealt with. The Birkett is a notable object lesson in geology. It runs through the Great Pennine Fault, and within the space of one hundred yards perforates shale, limestone, grit, slate, iron, coal, and lead ore; and in it the strata rise from the horizontal to the perpendicular. Farther north is the Smardale viaduct, 130 feet from stream to rails, and 710 feet long, in which over 60,000 tons of grey limestone were used. But why continue this catalogue? To take another point of view, let us note that the next contract section of the line contained 47 cuttings, 5 viaducts, 4 tunnels, 68 road-bridges, and 100 culverts; that the rainfall was 92 inches a year; and that although 2,000 men could only work on the section at a time, yet 33,000 passed through the wage list in the course of the undertaking.

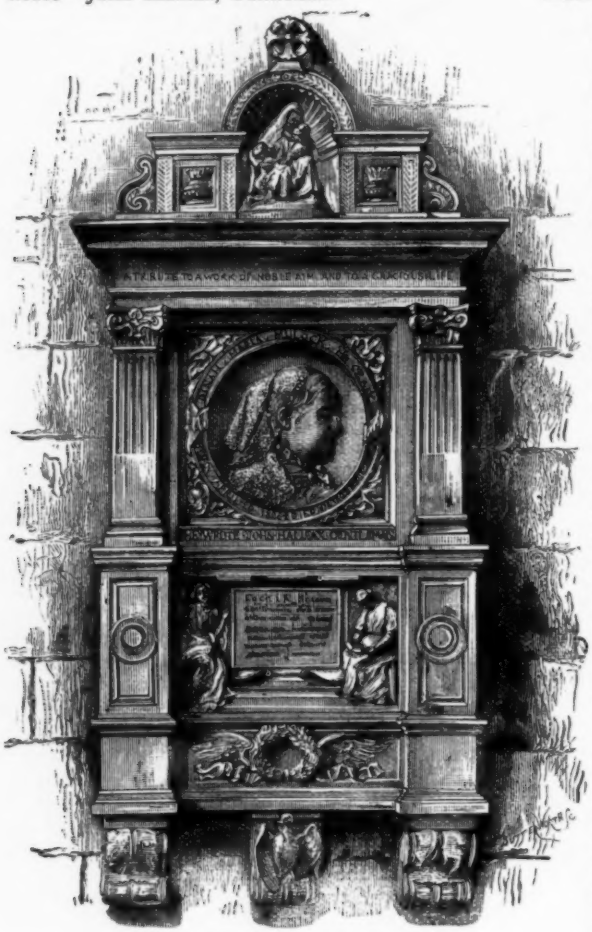
Of the navvy and his life much has been written, and of what has been written much has been imagined. The navvy of to-day has far less about him of what it is fashionable to call the "mere animal," but he is none the less greedy of work, and his appetite is gigantic. Some enthusiastic temperance advocate has told us that the railroads of this country have cost us £1,000 a mile in drink. This means that they have contributed about £8,000,000 to the Exchequer in indirect taxation. We doubt it. And certainly, during the last ten years, the rate of dissipation has been steadily lessening. The navvy has his friends and his foes. In many respects he might improve in his morals and habits. Have not "steam navvies" been introduced to replace him—which have no morals at all, and no habits to speak of? But with all his faults he is not a man of whom his fellow-men need be ashamed. Rough, uncouth, childish, though he may be, he is a very king to the man in the same condition of life on any railroad out of Britain.

There is one noble navvy story which has always seemed to us worthy of a place in our national note-book. It was at Bugsworth in Derbyshire, just north of Chinley, when the Midland was making. The mouth of the tunnel fell in, and a small gang of navvies were entombed. A short shaft was sunk, and in twenty-three hours the men were reached. They were found lying, almost dying, exhausted for want of air, and on the floor the candle was flickering in its socket, and in a few minutes would have gone out. The rescue was just in time, and when the men recovered they told a strange tale of one of the most prosaic of heroic deeds. They had been startled by the fall of rock, and found they were shut in, and for a moment were in fear. And then one of them said, "Well, chaps, we shall never get out of this alive, so we may as well go on with our bit while we can." And to work they set, in what they had every reason to suppose was their tomb, steadily and quietly, as if they were in a cutting in the open. And they went on with their "bit," until the air failed them, and they sank exhausted.

Mere navvies these! Not over sober, perhaps, on Saturday nights! Rude, blustering pagans! And at Bugsworth! The very name is enough to choke a poet! And yet, who of us would not take off his hat to the "chaps" who, in the very mouth of death, went on with the work they had undertaken to do?

W. J. GORDON.

TEWKESBURY ABBEY.



TEWKESBURY'S pride is the Abbey, and worthily so. Nobly does it bear its years and injuries. Shorn of many of its limbs, it stands a stately fragment, with an exterior of commanding strength, and an interior excelled by few cathedrals. The mighty pillars, like those at Gloucester, the great arches, the vaulting, and the tracery, are combined in such wise proportion as to yield a wonderful spaciousness from their harmony. The grandeur of the church as a church is unmistakable, and the perfect fitness of the whole for the use to which it is put holds us for a while from noting the details and thinking of the men who were its builders.

But thoughts come in time of Theoc who chose the hermitage and gave his name to the "bury," and of Fitz Hamon who found the funds for the main building; and looking towards the west door we can fancy the solitary deacon standing in the porch on that November day in 1123 at the consecration, when all this was new. We can hear the great procession forming in the cloisters and setting forth on its slow journey round the outer walls. We can fancy the ceasing of the chanting, the three blows of the pastoral staff on the new oak door, and the aged bishop's command, "Lift up your heads, O ye gates, and be ye lift up, ye everlasting doors, and let the King of Glory come in." And we can hear the solitary deacon ask in the silent stillness, "Who is the King of Glory?" And then the chant begins again, and round the building the procession goes, till it returns to the door and there is a similar ceasing and knocking and ordering and answering; and then the third time with the third knock comes the bishop's answer, "Even the Lord of Hosts, He is the King of Glory;" and the deacon opens the door, and in all the wealth of ecclesiastical magnificence the crowd of bishops and abbots and monks and patrons march in with a triumphal chant to take possession.

On a May morning but two years short of three centuries and a half afterwards there was another knocking at the door, and a disorderly group of fugitives from the battle-field came hurrying in with much less dignity. These were Edmund, Duke of Somerset, the Prior of St. John, and others fresh from defeat; and Abbot Strensham was only just in time to leave the altar and reach the door before King Edward's men were clamouring for admittance. For a time the fugitives were safe.

It was a Saturday; all that day and the next the abbot's authority was recognised; but on the Monday the church was entered and the miserable men brought out; and on the Tuesday a scaffold was set up at the Tolsey, and the headsman did his ghastly work.

Here were some of the victims buried. One tomb is pointed out in a doubtful way as that of Somerset. Another is said to be that of Lord Wenlock, whom Somerset slew in his anger when the battle was lost. Of Henry, Prince of Wales, said to have been killed on the battle-field or in a house in the High Street, now the Coffee Tavern, and buried near the tower, there is no memorial. Beneath the choir are many a Despencer and De Clare, and behind the altar lies the Duchess of Clarence, and with her probably her husband who was murdered in the wine cask in 1477. There are many chapels, all in ruins, and many tombs of abbots, and several more modern memorials. And among the latest is one of the best things in the Abbey, a beautiful tablet to the memory of her who wrote "John Halifax, Gentleman."

MEMORIAL TO MRS. CRAIK IN TEWKESBURY ABBEY.

The legend of "John Halifax" is known far and wide, and Tewkesburians have claimed Miss Mulock for their own. Hundreds of Americans come to Tewkesbury every year and identify the scenery of that notable book; artists come sketching the houses and landscapes amid which they are told the authoress was born and bred; and even the house is pointed out to some in which "John Halifax" was written "all in a fortnight"—a book of 180,000 words in fourteen days!

Alas for the legend! How soon the wish becomes father to the thought! How easily the multitude is misled! There are books which were written amid the influences that shaped their writers' lives; but "John Halifax" is not one of them. It is a work of art, life-like because it was produced in the true artistic spirit: a powerful domestic study, composed, like many a picture, from the materials gathered specially for the purpose.

Nothing can be simpler than the story of its building. Its authoress, Dinah Maria Mulock, afterwards Mrs. Craik, was born at Stoke in 1826. Her father was a minister of the "do as I say and not as I do" school, and finding his practice becoming daily remoter from his preaching, she and her mother and two brothers left him in despair. To keep the new home going she tried literature, and gradually worked her way through the crowd. In 1849 she published "The Ogilvies," which made her name known, but brought but little profit; next year she made a further advance in "Olive," which became famous enough to secure "The Authoress of 'Olive'" a whole article to herself in a popular magazine. In 1851 came "The Head of the Family"; in 1852 came "Agatha's Husband."

In the summer of 1852 Miss Mulock was the guest of Mr. Dobell at Charlton Kings, and one day she drove out through Cheltenham, the flat and genteel, along the dreary turnpike road to Tewkesbury, the quaint and historical. In rambling through the town a shower came on, and the party took refuge in one of the many narrow covered alleys which run at right angles to the few streets. From the town-clerk's house a little girl looked over the window-blind at a ragged boy opposite, and soon afterwards appeared at the door with a piece of bread and gave it to him, as did Ursula March in the opening chapter of the book. The shower being over, the party lunched at The Bell, which the landlord said had once been a tanner's, and then having seen the bowling-green, admired the hedge, noted the mill, and looked out over the Ham, they returned to Cheltenham.

Here were all the materials for a picturesque background and general tone. Here were the shower, the alley, the abbey, the house, the garden, the tanyard, the mill, and the opening incident. The drive back gave the coach ride with Kean to Chalton, otherwise Cheltenham, the arrival at The Fleece, the suggestion of the theatre, and of course the night walk home again. Another visit filled in the details, and the scene plan was laid; the plot, the career of a noble, successful man from boyhood to death, was ready; the names came from the tombstones and shop fronts; and the outline of the book was drawn. It took

THE BRIDGE, TEWKESBURY

four years, and not fourteen days, to write, during which time the authoress was at work in various other ways. Before it was finished she had become acquainted with Mrs. Oliphant, who introduced her to Mr. Blackett, the publisher, who received the manuscript as soon as it was complete, read it, liked it, printed it, and in 1856 gave to the world without delay "John Halifax, Gentleman, by the authoress of The Head of the Family."

Only once after those two days in 1852 did the authoress visit Tewkesbury, and that was for a few hours in 1887, just before her death. The scenery of "John Halifax" was thus not described from years of observation, but from a couple of days' hard work at sight-seeing with a view to business. There may be some who will be shocked to find the skeleton bared; but surely the lovers of the book will think all the more of her who gave the skeleton breath and thought, and made the creatures of her brain so real that with them they weep and laugh as though with familiar friends. Here is no plodding chronicler, but a gifted artist at whose touch the picture fills the frame with life.

Her note-book has probably gone the way of all note-books long before this; but we can make a fair guess at some of its entries. Of "the ancient abbey, Norton Bury's boast and pride," we have said enough. Let us to the churchyard, passing on our way "Mr. March, the West Indian Governor," otherwise John Reid, Governor of Jamaica. An autumn gale is shaking the trees, and the mahogany chestnuts come dropping on the tombs as we read the inscriptions. We are on the very path along which the note-book went, and "the large brown fans of the horse-chestnut leaves" are falling now, as then.

Plump comes a chestnut on to Fletcher's grave, only it is "William" not "Abel," but this William had the wife who died young. Why, here is Joyce; and here—but enough; one name we look for in vain. Where is the John Halifax who gave the book its title? Nowhere! We apply to the clerk, who confirms us in our doubt. "There is no such name here!" Alas! another legend gone—this time backed by the authority of Mr. Dobell himself, who told the story of the first day's drive. There is no Halifax, but there is a "Thomas White, Gentleman," who may have suggested the combination. Perhaps! But a few miles off in the direction of "the highest tableland in England," is Dixton Manor House, wherein lived William Higford, who wrote the "Institutes of a Gentleman;" had he anything to do with it?

At the abbey gate is the Bell Inn, which a shield in golden letters tells us is Abel Fletcher's house. It wants "the ponderous railings," but it does not disappoint. We enter the "respectable and handsome door," and find the "Jael" of the period peacefully cutting beans. Or was it "Jenny"? and was it "Jem Watkins" who was with her, and seemed to think it a bore that to read "John Halifax" would be one of his future duties?

Leaving them alone at their bean-trimming, we at last find ourselves on "the large square, chiefly grass, level as a bowling-green, with borders round." A bowling-green it is, beautifully level and shorn, and round it is the yew hedge—"not its like in the whole country"—"fifteen feet high and"—not quite—"as many thick." "Century after century of growth, with careful clipping and training," has "compacted it into a massive green barrier, as close and impervious as a wall," and further decorated it with many monstrosities of topiarian art. A fine hedge it is, its clear, sleek green serving as a brilliant background to the thousands of pink berries that now crowd its higher branches.

Close below is Shakespeare's Avon, "here a narrow, sluggish stream," slipping on quietly enough, "contenting itself with turning a flour mill hard by." And there is the mill, the "lazy whirr" of which is making "the sleepy incessant monotony" which Phineas was fond of hearing; and there is the little bridge and the private path from the tanyard. Beyond is the wide green level called the "Ham," and beyond that the Severn, with "the white sails gliding in and out from behind clumps of trees and across meadowlands"—though the sails might be whiter.

The path by the river gives a wider view, and leads us up by St. Mary's Lane, of "the green mound;" and that takes us on into Church Street and High Street; and so passing many an alley that would do for the one in which the peelings floated, we stand in front of a house that might be John's, and another that might serve as the Bank, and then discover to our amazement the old Brown Beare that ought to be six miles off on the road to Enderley.

Crossing the bridge we are at the Mythe, and from under Richard Brithwood's domain a train emerges. Red is the Mythe hill with streaks of gypseous green breaking the broad mass of keuper marl; and below is the Severn up which the eger travelled that had such important consequences "to the pleasure boat with the toppling sail" and the persons to whom it belonged; and beyond is a fine view of the town with the dominating abbey.

The day is bright and gusty; there is quite a sea on the Severn, and the telegraph wires stretch and curve in the breeze. Returning from the white Severn bridge we cross the old Avon bridge and stand at the boathouse where, twenty years ago, we were startled at the inquiry as to whether we would row on the Avon or the Severn, and discovered that out of the south door the boats were launched on one river, and out of the north door on the other.

Opposite the Beare we stand at the tree where King Edward stood more than four hundred years since, and watch the vicar and curate get under way on a tandem tricycle. Pleasant it is to note how respectfully the curate arranges the vicarial coat-skirts and then adjusts his own, that clerical

ABEL FLETCHER'S HOUSE.

dignity may not suffer on the useful but outrageously modern trinity of tyres. Thinking of the figure my lord abbot would have cut on a similar machine, we again traverse the local "High" and reach the lane, "shaded on one side by the willows in the water-courses." We come out "in those quiet hayfields, which tradition says had once grown wine for the rosy monks close by, and history avers were afterwards watered by a darker stream than the blood of grapes." But into those fields we cannot go far, owing to the proprietor being apparently a sufferer from excessive nervousness on the approach of an unbidden guest.

Here, or rather a few yards further south, did Queen Margaret stand at daybreak on May 4, 1471, to fight her last battle for the Red Rose. Her array defended the two old roads from Gloucester and Cheltenham, and the present main road runs through the centre of her position. Her general, Somerset, had strengthened the line with entrenchments and made the most of the water-courses; in front were the Yorkists trooping down from Rudgeway; behind were, it was hoped, Jasper Tudor and the Welsh reinforcements, which never arrived. She had marched from Exeter with the intention of crossing the Severn, but Edward had followed her too closely, and here she stood at bay with apparently every chance of success.

It was much the same sort of morning as this has been, brilliant and stormy. As the sun climbed up over the Cotswolds its rays were flashed from the elaborate armour and huge weapons of the knights and their followings, and the red and black and blue and yellow and white of the banners and pennons dotted the fresh greenery of the fields with patches of fluttering colour. At Rudgeway flew King Edward's standard; fanning out from it were the squares of Yorkists; then came the long line of Lancastrians behind the high hedge and broad ditch which stretched almost from the Swillgate to the river; and then came the small town, gabled and thatched, clustering round the cross at the Tolsey and flanked by the grand pile of abbey buildings.

Within the Lancastrian line rides a small group escorting Queen Margaret, who beckons the leaders around her and addresses them. Before she has ended, a slow cannonade opens, and soon the White Rose troops are in movement. On they come, the knights in plate armour on heavily armoured horses, the men in buff and brown and Lincoln green. The guns cease and the air is full of the tumult of battle, and the arrows fly and the steel flashes along the thick hedge which holds back the glittering flood of assailants. Again and again the knights race up to that green barrier; the crowds thicken behind them; with many a shout they strive to break it bit by bit, as John Halifax would have done the yew. Foremost in the effort is the high-shouldered leader, a boy of nineteen, the formidable Richard of Gloucester; but Somerset is too strong for the stripling duke, and things go well for the Red Rose. One more effort all along the line, and this fails like the rest; and then the Yorkists call a retreat. To try elsewhere? By no means.

It is the old story of Senlac; the boy has remembered his history book. Back go the Yorkists; into the trap falls the foolish Somerset; from many an artfully hidden gap in that long hedge his chivalry rush forth in pursuit down into the meadow and up the opposite slope, while half his army stand idly looking on. To the right-about turns Richard. There is a furious encounter; down goes many a horse; dented is many an armour coat; while the battle trembles in the balance, Clarence comes to his brother's help; and as, foot by foot, Somerset is being mastered, a band of the King's spearmen from the Park Wood come pricking into his rear.

Still Wenlock stands idle behind the entrenchment; triumphant are the Yorkist war-cries; Somerset's dogged defence becomes a withdrawal, a retreat, a rout; back into his hedge he is driven, his troops a raging crowd with the Yorkists busy amongst them. Through is Richard; through is Clarence; and following them close rides the tall King with a crown on his helm and the royal arms on his shield, slashing right and left with his heavy, long sword from his richly armoured berry-brown steed. In a fury Somerset leaps to the grey-haired Wenlock and, calling him "traitor," dashes out his brains. Van, centre, and reserve of the Lancastrians all huddle together, hopeless of command. The ill-starred Prince of Wales presses amongst them and calls for one more charge for his mother; but in a panic they throw down their weapons and run like stampeded cattle. Chasing them are the three brothers, each leading his array—the big King in the centre, Clarence of the Malmsey butt by the Cheltenham road, and the terrible Richard nearest the river. The carnage is fearful, "three thousand Lancastrians fall on the field," many of them in the Vineyards by Clarence's men; more of them in the Gastons by the King's men; most of them by Richard's men in the Bloody Meadow, the "sloping field, through the middle of which ran a little stream down to the meadow's end where fringed and hidden by a plantation of trees the Avon flowed;" and along the river-bank the last of the fugitives are driven to be drowned at Abel Fletcher's mill.

And at the mill we end our ramble on the battle-field. And now where shall we find Enderley Flat and Nunnely Hill and Longfield and Beechwood? Go to Bredon, say some, and find Longfield on the hillside in the neighbourhood of Overbury. And Enderley? and Rose Cottage, and the common, and the churchyard? And then it appears there are conflicting claims, and the scenery of the book is truer in spirit than in detail; in fact, the country has been treated as the town was, and we must content ourselves with the picture that the artist has given us.

But if the table-land is not on the Cotswolds, where can it be? Let us be off then through Stoke Orchard and Bishop's Cleeve to Nottingham Hill and Langley Hill and down in the valley to

ABEL FLETCHER'S MILL.

Winchcomb. Here are hills and woods and brooks and views enough. By some we are told that Winchcomb is Kingswell, but as no borough in either Gloucestershire or Worcestershire was disfranchised under the Reform Act of 1832, we can leave the matter open

Winchcomb is, however, not an uninteresting place, although fallen considerably from its importance. Once it was the home of the wicked Quendrada, Kenulph's daughter, who murdered her seven-year-old brother, Kenelm, and buried him secretly in Clent wood. Whereupon, so the legend goes, a dove miraculously dropped a scroll on the high altar at Rome announcing the Mercian's crime, which strange "information received" led to a search "in Clent sub spina &c." and the discovery not only of the body, but of a spring that had arisen on the spot of the murder. And so they exhumed and reburied young Kenelm; and Quendrada, thinking to disturb the funeral, "did loudly chant the hundred-and-ninth psalm

out of a window," but strange to relate, "suddenly her eyeballs fell out!"

But Winchcomb is noteworthy for something else. Centuries afterwards Walter Raleigh sent a packet of tobacco seed to Pates, who founded Cheltenham Grammar School. Pates had a friend at Winchcomb, and at Winchcomb was the tobacco sown. And here is the Wesleyan Chapel on the site of the tobacco barn, and here is another tobacco barn where the weed was warehoused, for it was grown largely in the neighbourhood; indeed in 1658 a certain Cornet Wakefield came here from Gloucester especially to destroy this tobacco, but the countrymen stood stoutly to their pipes—misprint for pikes—and won a notable victory over the anti-tobacconist. At Postlip, close by, the weed was wetted and dried, and tobacco was a profitable crop hereabouts until killed by the excise in the interest of our American planters.

A mile or so up the Isbourne is Sudeley Castle, once a seat of the Seymours, where Queen Katherine Parr, who died a Lady Seymour, was found in her coffin, "an ivy berry having sprouted in the coffin and enshrined her temples." Sudeley has been restored and is a show-place now well known to tourists. But let us up to the hills and look out over the wide vale of Severn. "Do you see that gleaming bit in the landscape far away? That's water—that's our very own Severn, swelled to an estuary—you can only get that tiny peep of water, glittering like a great diamond that some young Titaness has flung out of her necklace down among the hills."

It is a wonderful view, wide and beautiful, with the massive Malverns as a background. All grows dark below as we look, but the sky above is bright and silky. One long dark cloud is slowly advancing, so low that we peep over it and see its summit, a heap of grey curdly foam. As it passes, it grows lighter in hue and to the north ends as a fleecy mass against a starch-blue sky. Lower still is a layer of clouds racing the rest, and, above, the streaks of vapour are golden and red. Soon the sun will set, and in darkness we shall enter Cheltenham. And thus with the fall of night we bid farewell to the country of "John Halifax."

BOWLING GREEN (BEHIND ABEL FLETCHER'S MILL).

## Henry Schliemann.

DIED AT NAPLES, DECEMBER 26, 1890.

LIVING, he strove like Heracles with Death,
Crying, Restore! unto the robber King,
And drew from him full many a precious thing
Hidden long whiles the silent dust beneath.
Time sat at jealous watch on hill and heath,
Brooding above strange hoards and buried spoils,
And the huge triumphs of Cyclopic toils
Wrapped round with turf and many a wild-flower wreath.
But he, in vision, saw the hillside heave
And through the rifted clods in stealth disclose
Those marvels; which impatient to believe,
With that bright dream before him, he arose
And drew the earth-cloak from them, and behold,
The warm sun flashed upon the Age of Gold.

HORACE G. GROSER.

# GASTON MERY'S QUEER GUEST.

A PARISIAN STORY.

ONE sultry evening late in June 1870, a young man might have been seen leaning against a tree on the Quai d'Orsay while another supported him with his arm to prevent him from falling. The one thus supported was pale-faced, undersized, and shabbily dressed. His appearance told nothing respecting him except that he was badly off, and that he was suffering either from extreme weakness or from sudden illness. The other was rather tall, burly, with dark-toned ruddy face, carelessly dressed without being shabby. He wore a wide-brimmed felt hat on one side of his head, and in the hand that was free he held a colour-box and sketch-book tied together. There was no mistaking him; he was the art student who was old enough and perhaps masterly enough to call himself an artist, but who still from peculiarity of character or taste retained much of the air and style of a *rapin* of the studios.

"What is the matter with you?" said he to the man whom he was holding up.

"I am subject to these attacks," the latter replied in a very weak voice. "This will pass off in an hour or two."

"An hour or two!" repeated the other quickly. "I am afraid I shall not be able to prop you up so long as that."

"Don't leave me yet," groaned the sufferer. "I —I also am an artist."

"You an artist!"

"Yes, I came to Paris from Rheims only two days ago to copy in the Louvre."

"That being so," exclaimed the owner of the wide-brimmed hat with sudden animation, "I will take you to my cavern in the Rue de Vaugirard. You will get over your attack quicker there perhaps than if you were to stop here with your back against this tree.—No, no, do not thank me, I am quite selfish in the matter, I assure you. I would rather take you with me than stay with you here, and of course I must do either one thing or the other. We daubers stand together fraternally—at least we do so on this side of the water. If you had been taken ill on the opposite side I might have left you with a serene conscience to the care of others."

A passing cab was hailed and was presently rumbling over the pitching of the Faubourg Saint-Germain towards the Latin Quarter, and the spot where the two men had been standing was deserted.

The Good Samaritan of this adventure was Gaston Joseph Méry, son of Zacharie Méry, grocer, hosier, and wine seller of Carcassone. Almost everything within the range of modest incomes was sold in the dim and dingy little shop over which Gaston was born. Zacharie flourished and brought up a family of children that would have scandalised a Paris *bourgeois*, not by their bad manners, but by their extravagant number. Gaston was the eldest son, and from the hour of his birth the father cherished the hope that he would some day help him in the shop, become his partner, and eventually take his place. But Gaston, as he grew to years of reason and wilfulness, did not correspond at all to these expectations. He never could be serious unless he had a pencil and sketch-book in hand, and was drawing some bit of scenery in the open country, or a quaint house in an old street of the town. His favourite companions at other times were reckoned among the most hopeless scapegraces in Carcassone. Zacharie was wofully disappointed with his son, but his brother the tanner, who as a soldier had seen a good deal of the world, tried to console him by talking about temperament, and advised him to allow Gaston to cultivate his artistic bent as the only way of making him work. So after long hesitation and with much misgiving Zacharie sent Gaston to study art in Paris under the watchful eye of a distant relative, and with an allowance of 120 francs a month.

Some years had passed between his arrival in the capital and this hot June evening when he acted the part of a philanthropist. He had gone through the Ecole des Beaux-Arts with credit, had exhibited pictures in the Salon, and had even found purchasers for some of them, but he still drew supplies of money from the grocery at Carcassone. To tell the truth he had no great desire to be independent. He had in an equally full measure the good and bad qualities of the artistic Bohemian, combined with the fervid and impulsive nature of the Southerner. In him fits of industry alternated with longer fits of indolence. His full capacity for enjoyment, his incessant flow of animal spirits and eager appetite for pleasure, rendered him an uncongenial companion to the thoughtful, contemplative student; but he gained the warm admiration of reckless spirits like himself.

Gaston Méry had often suffered from this unreflecting generosity and improvidence, but he seemed quite incapable of profiting by the unpleasant lessons of experience. When there was money in his pocket his hand was always near it; but his hard-up friends effectually prevented him from indulging extravagant tastes. He would often lend to-day and be obliged to borrow on the morrow for his dinner. His society was more sought after at the beginning of the month, when his allowance was fresh in hand, than towards the end, when he was left high and dry on the shore of impecuniousness; but although he was shrewd enough to notice this, he did not let it trouble him. The little weaknesses of humanity amused him, they never soured him or stopped for a moment the flow of his youthful spirits and undiscriminating good nature. With

such a character as this, Gaston Méry was capable of almost any act which the world in its wisdom links with inexperience and folly.

At length the cab stopped in the Rue de Vaugirard, and Gaston almost carried his companion to the fifth floor. "There go a pair who are not much good," muttered the *concierge* as she peered out of her window on the ground floor, like an owl from a cage. It was on the fifth flat that Gaston had his room, which served the double purpose of a studio and a sleeping apartment. A broker's lumber room could hardly have presented a picture of more complete disorder than this artistic den. The solitary table was heaped with ragged paper-covered novels by Eugène Sue, the elder Dumas, Henri Mürger, and other literary Bohemians, whose influence was still strong in the closing years of the Empire; rough sketches in pencil and chalk, dry crusts, half smoked cigarettes, and all manner of artistic odds and ends. The sofa, covered with faded red velvet, was similarly laden with what any woman blessed with a well-regulated mind would call rubbish; the bed in the alcove was strewn with hastily changed wearing apparel; numerous studies in oil adorned the walls; while in the corners next the floor were canvases, some rolled, others strained upon frames, rusty swords, an old musket, pieces of drapery once gaudy but now dingy with dust, and rows of very dirty-looking bottles. Upon an easel near the window was a canvas with the figure of a little Savoyard carrying a marmot painted upon it, in dead colour. There was a wardrobe, but there were only two chairs, and one of them was occupied by a palette that had been left uncleaned, and a bundle of brushes. Such was Gaston Méry's room.

As soon as he and his *protégé* had entered, and the door was closed again, Gaston took everything that was upon the sofa in his arms, and threw it upon the floor, quite indifferent to the cloud of dust which he raised. "Now," said he, taking his queer guest by the arm, and leading him to the piece of furniture which had been cleared of its stratified lumber, "lie down there, and if you are well enough to speak, tell me something about yourself."

The young man whom he had thus addressed fixed upon him a pair of shining dark eyes, but said nothing.

"Are you in pain?" asked the artist, making another attempt to draw him into conversation.

"Yes," replied the other, faintly.

"Where is it—I mean the pain?"

For answer the sufferer pressed his hand against his forehead and groaned.

"I know nothing about these matters," said Gaston, "but if you will make yourself as comfortable as you can there, I will go and fetch a friend, a medical student, who is sure to be at the Café Voltaire, and then we will see what can be done for you."

"Thank you a thousand times," murmured the stranger, and his eyes shone with extraordinary brilliancy.

The artist had no sooner gone, and closed the door, than a marked change came over the figure on the sofa. The languor and limpness left it; it assumed a sitting posture, the energy of which was in strange contrast to the drooping, half lifeless attitude of a minute before. The change in the expression of the face was no less wonderful. The hanging lower jaw was drawn closely up, and the lines about the mouth, so indicative of severe physical and mental suffering, became those of a dreadfully sardonic laugh. This expression however, after a few seconds, gave place to a slightly better one, and the sinister individual whom Gaston Méry had taken under his protection began to think aloud in sentences like the following:—

"An imbecile, this *rapin*, but I like him—a heart in his body—makes me quite ashamed of my present occupation. But we must all live somehow. I have tried honesty, a starving business with those who have had no start in life. When you have been picked up on a doorstep, and have been reared by vile peasants, who have just kept enough life in you to get their money from the government, you must use your wits against the world, not for it. I am sorry for you, my artistic friend, and I think it a pity to spoil your good nature, but if you have left any loose money or handy valuables about, I must really become your debtor until times mend. I must be quick too, for I have not the slightest desire to make the acquaintance of your medical friend."

He walked stealthily round the room with the candle in his hand, keenly scrutinising the different pieces of furniture. In less than a minute his eyes were fixed upon the wardrobe near the alcove. "There," said he, "the squirrel keeps his nuts if he has any." He drew from his pocket a clasp knife, fitted up with a variety of small implements, and thrusting one of these into the keyhole, he pulled the door open almost without an effort.

"Not locked," muttered the thief. "This is a bad sign—Ah!"—The exclamation followed a moment afterwards. The searcher had found a fifty-franc note and a ten-franc piece. He put the paper and the bit of gold into his pocket and moved towards the door. Then he stopped, looked back at the wardrobe, moved another step towards the door and stopped again.

"I must decide quickly or they will be here, and then I shall have to pay dearly for my hesitation."

After this sagacious reflection, he advanced another step towards the door and stopped again; then with the look of one who gives way to an impulse which he knows to be absurd, he turned and, walking swiftly to the wardrobe, put back the fifty-franc note where he found it. This done, he darted from the room, almost leapt down the stairs, and passed out into the street.

Presently two figures entered the house arm in arm and went upstairs.

"Not so fast, friend Gaston, not so fast," said Paul Piquet, the smaller of the two, in a treble voice that made the hearer ready to laugh even when the thought of being comic was not in the speaker's mind. "Remember I have dined on something more substantial than philanthropy."

"But," urged the artist, "I don't know what may have happened in my absence."

"True," replied the other, "more may have happened than has entered into your calculations."

"Do you think he may have died?"

"Died! bah! not he."

"What then?"

Paul Piquet said nothing in reply, but shrugged his shoulders in a way that expressed a great deal.

"Well, here we are!" exclaimed Gaston Méry in his great voice, that would have been invaluable to him had it been his business to cry in the Paris streets, "*Tonneaux! Tonneaux! marchand de tonneaux!*"

They had stopped on the fifth floor, and the artist was about to open the door of his room when he perceived that it was ajar. "*Tiens*," he said, "I could have sworn that I closed it."

He now pushed the door wide open, and walking up to the table where the light was still burning, glanced searchingly towards the sofa. There was silence for a few seconds, but it was broken by a word thrown out with a full meridional accent. It was "*Tonnerr-re!*"

"What is the matter?" asked the medical student in a tone of mock surprise, for he guessed at once what it was.

"He is gone!"

"No, no, impossible! Look in your bed. I daresay he grew tired of waiting for us and crept in there."

Gaston did move towards the alcove, then, sitting down on the edge of the bedstead, he raised a peel of laughter that caused the student to put his meagre hands to his ears.

"Before you make so merry," he suggested, "perhaps it would be well to see if you have paid more for playing the Good Samaritan than the experience is worth."

This remark had the effect of checking Gaston's outburst.

"You are a pleasant dispenser of cheerful thoughts," said he to his friend. "I had but sixty francs left, and we are only in the first week of the month. If he has taken that, I shall have to carry my watch and chain back to the old place."

"To the Rue Bonaparte?"

"Precisely."

The student chuckled. "Where did you put your money?" he presently asked.

"There, in the *armoire*."

"Look at once and see if you have it still."

Gaston took the candle and opened the wardrobe. He put his hand at once to a corner with which he was very familiar, and clasped to his great satisfaction the fifty-franc note, which he waved triumphantly at his friend. "There, you see," he exclaimed, "the fellow was not so bad after all."

"Then you have lost nothing?" said the sceptical student. Gaston looked again at the shelf, this time more carefully. He searched with eyes and hands, then closed the *armoire* without saying a word.

"Well?" inquired the other.

"The ten-franc piece is gone," rejoined the artist.

"That seems incredible."

"Why?"

"Because no thief in his senses would have taken the bit of gold and left the note."

"Perhaps he was not in his senses. Somebody has been to the *armoire* and has made hay with my linen, and somebody has taken the ten-franc piece which was inside the note."

"Ah! That is strange indeed," observed the student.

Gaston seated himself again on the edge of the bedstead, and his companion took the vacant chair. There was a pause, which was broken by the student: "Your new acquaintance is a puzzle to me," he said. "His case is one for psychological analysis."

"You analyse his psychology then, while I eat a beef-steak and a bit of *brie* at the Dancing Rabbit, for I am dying of hunger. To tell the truth, I think I am well out of this business at the price of ten francs."

"In that I quite agree with you," said Paul Piquet.

The room was soon in darkness, and the two friends, so unlike in everything and yet such excellent companions, were laughing over the evening's adventure at the Dancing Rabbit.

Not many days after this little episode in the life of Gaston Méry, war broke out between France and Prussia. This hurricane swept from men's minds every thought that was not bound up with the burning question—Who will conquer? After the revolution of September, and when the combined German armies were marching on Paris, Gaston was one of the many representing all conditions of life who volunteered their service for the defence of the capital. The horrors of which he was a witness during the next three months had a marked influence upon his character. Among the comrades who were killed before his eyes was Paul Piquet, the medical student. He was engaged in ambulance duty, and then it was perceived that his cynical impassiveness was unreal, for no one showed greater energy or exposed his life with a more noble recklessness in the petty battles round Paris than he. At length he was struck in the temple by the fragment of a shell, and fell lifeless upon the body of a wounded soldier. Gaston Méry lost his jovial laugh, his dark eyes took a fixed expression of seriousness, which had never appeared in them before for more than a second or so at a time, and in those few months he appeared to have grown several years older.

On January 18, he was one of the army of nearly 100,000 men who marched out of Paris, in the teeth of the glacial north-east wind, by the gate of Courbevoie, to attack the Prussians on the heights of Montretout and Buzanval above Saint-Cloud, to carry their intermediate positions between these points and Versailles, only five or six miles distant, to drive the King of Prussia, now Emperor of Germany, from his headquarters—the palace of Louis XIV,—to break through the investing lines, re-establish communications with the provinces, and relieve Paris, girt with fire like Brünnhilde, and stricken with famine. This was Trochu's plan, and

it was nearly successful, thanks to the valour of the citizen troops, not to the forethought and energy of those who directed the operations. The fatal want of judgment, which began the series of French defeats, likewise turned the scale against the Parisians in their final and frenzied effort to force an opening in the fiery circle, drawing closer and closer to their city.

What a strange army was that which went out of the gate of Courbevoie, and marched up the snow-white valley of the Seine on January 18! What social contrasts were there! Men of fortune, men of letters, artists, lawyers, doctors, actors, tradesmen, artisans, labourers, ragpickers, released gaol-birds, assassins—literates and illiterates; men whose faces bore the stamp of intellectual refinement and moral dignity, others with terrible masklike visages, branded indelibly by habitual vice. The best and the worst of the population mingled homogeneously, fired by one superb thought, which went far to realise equality—the relief of Paris, if necessary at the price of the greatest sacrifice that man can offer, either to his God or to his country, namely, that of his life.

Early on the morning of the 19th this truly patriotic army advanced through the mist up the slopes by Mont Valérien to the assault of the Prussian batteries on the ridges of Buzanval and Montretout.

The day was glorious, yet disastrous to the Parisian army. Positions won at the cost of much blood and valuable lives, like that of Henri Regnault the artist, were surrendered in the evening by men exhausted by several hours' fighting, and physically incapable of maintaining the struggle with the fresh troops which had been brought up from Versailles. As evening came on, the vines on the slopes of Buzanval drank deeply again of French blood; but now, the Parisians, instead of advancing to the assault, spurred by enthusiasm and confident of victory, were in disorderly retreat; dejected, hopeless, thinking not of victory but of flight; carried onward, not by the noble ardour of patriotism, based on self-sacrifice, but by the dull or frantic animal impulse of self-preservation.

Among the last of the fugitives on the slope, just above the hamlet of Buzanval, was Gaston Méry, blood-bedabbled and smoke-begrimed, but without a wound. He, too, was hastening over the foul and blood-stained snow, that was so pure and white when the morning broke upon it. Shells went shrieking over his head to drop into the midst of his comrades hurrying towards the valley; bullets whistled by his ears. Suddenly he stopped, thrust a cartridge into the *chassepot* which he still carried, turned and fired towards the brow of the hill, which now in the dusk seemed to vomit flame from innumerable mouths. An instant afterwards the musket dropped from his hands, and he reeled backwards. He did not fall, for somebody caught him in his arms from behind, and laid him gently down,

"Where did it strike you?" asked the soldier, who was kneeling by his side and bending over him.

Here," replied the artist, pressing a hand against his breast. "It has gone through my right lung."

"I am too weak to carry you, for I have lost blood, but I will stay with you," said the soldier.

"Who are you?—I seem to know you," said Gaston, faintly.

There was no answer. "Ah! I remember!" gasped the artist, as he gazed intently at the strangely shining eyes in the white face that was so close to his own, "You are the—the——"

"The *canaille* who repaid your goodness by stealing from you."

"Don't speak of that now——"

"But I was not so bad as I intended to be," continued the soldier, "and I have wished to live honestly since. The war came to my assistance. I have tried to keep near you all day, so that if you were wounded I might prove to you that I was not the ungrateful thief you must have thought me——"

Gaston could no longer see the eyes that were fixed upon him, but he felt tears drop upon his face.

"I have never thought ill of you," said the dying man, and he spoke truly, Then, raising his voice with sudden energy, he continued, "Take care of yourself now, my friend. No one can do me any good. Hasten away. Give me your hand. Adieu!"

"No," replied the other, in a low firm voice, "I will not leave you."

Long after nightfall the Prussian batteries on the hills continued their fire upon the retreating army, and the guns of Mont Valérien. which covered the retreat, thundered in reply. Then the cannonade ceased, and when the country no longer flashed with the savage glare of artillery, the peaceful glitter of the stars was the only light that fell upon the battle-field. The keen frost froze the blood that was lately warm—froze it, too, as it oozed from men still living; it hardened likewise the half-melted snow, but could not bleach it of its crimson stains. It mercifully came to the relief of those who were waiting for death, and changed their agony into calm.

When the morning broke again, the dead who were found upon the field were collected and buried. There were two soldiers lying among the leafless vines, each holding his dead comrade's hand. One had been shot through the body, and the other had been frozen to death. Those who found them respected their friendship in life, and, although they were buried in the same grave with many others on the crest of the hill, they were laid side by side. The trench was dug on the edge of a little wood, and a small monument now stands on this beautiful but mournful spot, to the memory of the slain. The linnet and the robin sing in the branches of the young firs, which cast upon the tomb year by year a deepening shadow; roses bloom in the little sheltered garden, until the first snow whitens it; and on every 19th of January fresh wreaths are brought and left upon the stone, which the grey-green lichen has brightened again with new colour.

EDWARD HARRISON BARKER.

# TRACES OF A VANISHED CIVILISATION IN DARKEST AFRICA.

THE HILL OF ZIMBABYE.

THE expedition of the Chartered Company of British South Africa to Mashonaland has revived an interest in the singular relics of an unknown civilisation, which are found scattered here and there in lands which have rarely been visited by white men.

Some of these were described and figured by Baines in his "Gold Regions of South Eastern Africa," published in 1877, having been discovered by Carl Mauch in 1871. Baines's description tallies so exactly with that of the most recent explorers that we will here give it in full :

"These ruins, known as those of Zimbaœ, Zimbabye, or Mazimbaœ, are situated in South latitude 20° 15′ 34″, longitude 31° 37′ 45″ East, and 4,200 feet above the level of the sea. The ruins are eleven miles from Pike's Kraal ; they are extensive, and one collection covers a considerable portion of a gentle rise, while another—apparently a fort—stands upon a bold granite hill. The walls are still thirty feet in height, and are built of *granite hewn into small blocks about the size of our bricks, and put together without mortar.* The most remarkable of these walls is situated on the very edge of a precipitous cliff, and is in perfect preservation to a height of thirty feet ; the walls are about ten feet thick at the base, and seven or eight at the top. In many places there remain beams of stone eight or ten feet in length, projecting from the walls, in which they must be inserted to a depth of several feet, for they can scarcely be stirred. At the most they are eight inches broad by three inches in thickness, and consist of a very compact stone with a metallic ring and greenish-black colour. On one stone, ellipsoid in section, and eight feet in length, ornaments are engraved, consisting of lozenge-shaped figures one within another separated by horizontal bands of diagonal lines. Under a great mass of rock Mauch found a broken vessel (shaped like a wooden Kaffir basin) of talcose gneiss, extremely soft, eighteen inches in depth, one and a half inches in thickness, and half an inch thick in the bottom. The dense bush, the gigantic nettle plants, the jealousy of the natives, and want of means prevented further investigation."

Mauch himself, however, in a letter dated September 1871, and addressed to the Rev. Mr. Gruetzner, gives fuller details. He says :

"The ruins may be divided into two parts : the one upon a granite rocky eminence of 400 feet in height, the other upon a somewhat elevated terrace. The two are separated by a gentle valley, their distance apart being about 300 yards. The rocky bluff consists of an elongated mass of granite, rounded in form, upon which stands a second block, and upon this again fragments smaller, but still many tons in weight, with fissures, chasms, and cavities. The western side of this mountain is covered from top to bottom by the ruins. As they are for the most part fallen in and covered with rubbish, it is at present impossible to determine the purpose the buildings were intended to serve : the most probable supposition is that it was a fortress impregnable in those times, and this the many passages—now, however, walled up—and the circular or zigzag plan of the walls would also indicate. All the walls, without exception, are built without mortar, of hewn granite, more or less about the size of our bricks. . . . Best preserved of all is the outer wall of an erection of rounded form, situated in the plain, and about 150 yards in diameter. It is at a distance of

about 600 yards from the mountain, and was probably connected with it by means of great outworks, as appears to be indicated by the mounds of rubbish remaining. This oval has had but one entrance, which is three feet in width and five feet high, and upon the northern side, that is, facing the mountain. It had, however, been at one time built up, although subsequently in part fallen in again. The cause of this was probably the brittleness of the wooden crossbeams, which had too great a weight to carry. Inside, everything excepting a tower nearly thirty feet in height, and in perfect preservation, is fallen to ruin, but this, at least, can be made out, that the narrow passages are disposed in the form of a labyrinth. This tower consists of similar blocks of hewn granite, and is cylindrical to a height of ten feet, then upwards to the top conical in form. At the foot its diameter is fifteen feet, at the top eight feet, and it shows no trace of any entrance.[1] It stands between the outer wall and another close to and parallel with it, the latter having had a narrow entrance. This entrance has, up to the height of a man, four double layers of quite black stone, alternating with double tiers of granite. The outer walls show an attempt at ornamenting the granite—it represents a double line of zigzags between horizontal bands. This ornament is twenty feet from the ground, and is employed upon a third part of the south wall on each side of the tower, and only on the outside."

Baines gives a sketch of this tower, which he says is called "The House of the Great Princess," or "Palace of the Queen," adding: "Formerly, at intervals of three or four years, the people assembled here for solemn feast and sacrifice. After the sacrifice the High Priest entered the Tower, sprinkled the place, and prayed that 'Mali,' or the Father, would remove all disease."

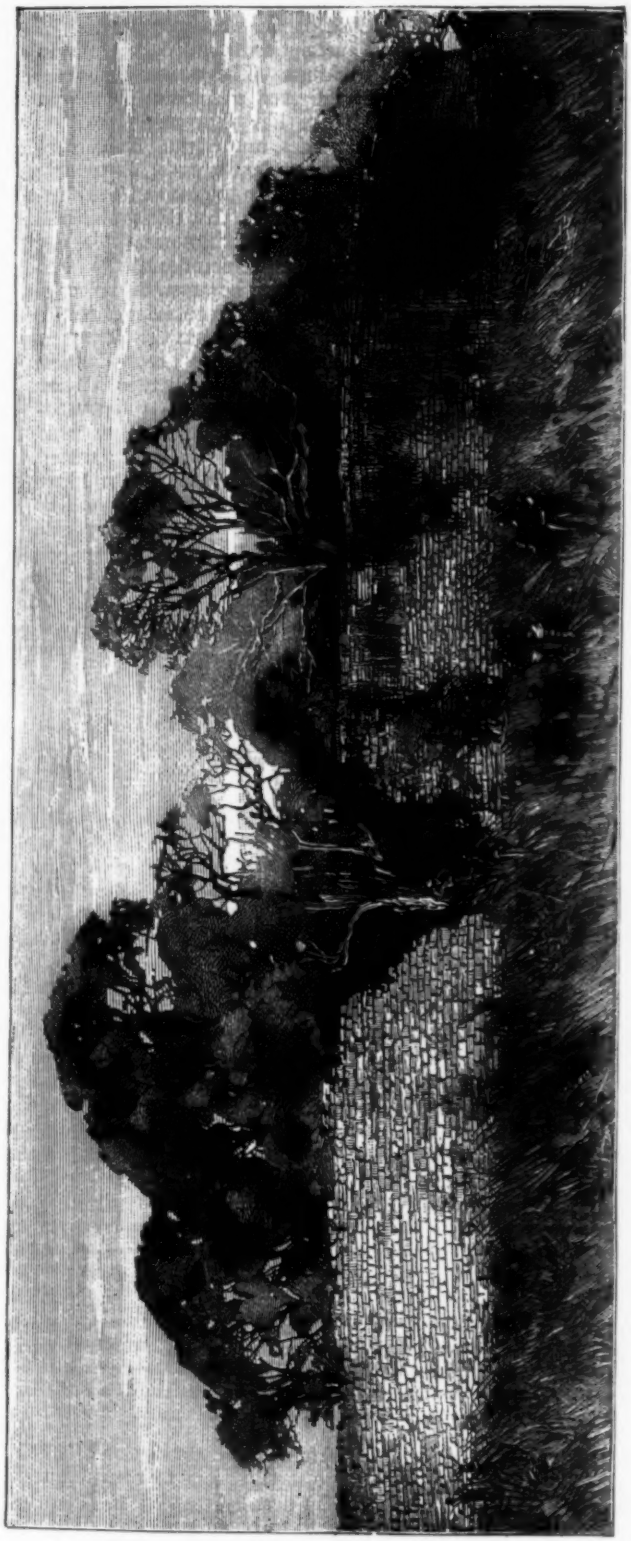
As, however, Mauch distinctly says he could see no entrance to the tower he describes at Zimbabye, and as the one figured by Baines appears to stand isolated and not enclosed with walls, it is possible that the latter traveller may refer to a similar tower elsewhere, for he says truly, speaking of Zimbabye: "I may mention that these are not the only collection of such ruins known to exist. My friend the Hon. G. C. Dawnay saw and sketched a mass of similar masonry about eighty miles N.N.W. of Tati, and others are reported in the Transvaal several miles east from Nylstrom."

A later traveller, Mr. A. A. Anderson, in his book entitled "Twenty-five Years in a Waggon," figures several similar ruins from different parts of a very wide district, but these are all square in outline, with outer walls. It may be as well to give his description of one of these in order to compare it with Mauch's account of Zimbabye:

"About a mile to the west of the Tati station, on the summit of a hill about 200 feet above the river, are some very interesting remains of an ancient fort built of hewn stone. The outer walls now standing are four feet in height, with two courses running the whole length, about half-way up, with five regular courses between, built in the herring-bone fashion, similar to those in old Roman walls now preserved in England. These stones are very thin, not much thicker than common tiles; the other courses have stones in regular layers—three inches deep and about a foot in length. This wall is two feet thick, and encloses a space of about half an acre. The floor originally was concrete; large portions still remain, and nearly in the centre are portions of small furnaces for melting metal. At the south-west corner of this enclosure are several rooms, with walls dividing them seven feet in height. In the eastern room the walls are twenty feet high, and it appears to have been a tower, leaving a space of some four feet between the outer and inner wall; and when in a perfect state it must have been a strong place of defence, standing, as it does, on the topmost ridge of the hill, overlooking the river and surrounding country. There is no evidence of any mortar being used. . . . It is a most interesting ruin, and well constructed, evidently the work of a white race. There are no Kaffir tribes in this part of Africa, or south, that have ever been known to build their kraals square, or with hewn stone. Other ancient and similar ruins are still preserved beyond these diggings higher up the river."[1]

These last are evidently those mentioned by Baines as seen by Mr. Dawnay.

The distance between Zimbabye and Tati is, speaking roughly, 400 miles, and it is about 150 from Zimbabye northwards to Manica, where similar ruins are reported, whilst old forts are found as far north as Tete, so that it may be said that traces of the unknown but certainly civilised builders of these remarkable ruins extend over a geographical area embracing at least six degrees of longitude, and even more of latitude.



The homogeneity of these remains is attested not only by general form and similarity of material employed—always hewn granite blocks, rather larger than ordinary bricks, put together without mortar—but also by the mode of ornamentation, which at Tati, as at Zimbabye, consists of a zigzag pattern, formed of thin slabs of stone resembling tiles, let in between the courses of masonry. That the constructors of these buildings were not Portuguese is certain, as some of them are described by the early Portuguese writers as even then objects of wonder; thus De Barros describes the Zimbabye ruins as "admirably built inside and out of hard freestone. The blocks of which the walls consist are put together without mortar and are of extraordinary size," adding, "the natives say they are the work of the devil, because they are beyond the power of man to execute. When Captain Vic Pegado, with a view to comparison, pointed out the Portuguese masonry of the fort at Sofala, with its windows, vaults, etc., to some Moors who had been at the ruins, they observed that the latter structure was of such absolute perfection that nothing could be compared to it."[2]

Dos Santos, in his "History of Eastern Ethiopia" (published 1684), mentions Zimbabye more than once. He calls it the chief city and residence of the Quiteva, by which name he designated the Monarch of Sofala at the time of the Portuguese invasion, adding "the King has dominion over the whole of the country, as well as the river of Sofala, whence the inhabitants carry on uninterrupted commerce with those of Manica, who make return for the merchandise they take in gold dust." Dos Santos speaks of the rulers of Quiteva as Moors, by which he probably means Arabs, whilst their subjects are always called Caffres, and he relates that the latter, alarmed at the approach of the Portuguese under Baretto, forsook their towns and took shelter with their cattle and provisions in neighbouring forests, and he names especially Zimboé as thus evacuated, adding, "Baretto consequently entered it without resistance, and as he

[1] It seems not improbable that this tower may guard the well or water-tank of the fortress, and that a subterranean entrance may exist at some distance away.

[1] "Twenty-five Years in a Waggon," vol. ii. p. 127.

ZIMBABYE RUINS.

had not a sufficient force to garrison, and indeed did not wish to preserve it, he gave it up to pillage, and after setting it on fire continued his march towards the kingdom of Manica."

It may, therefore, be assumed as an ascertained fact that these ruins are not of Portuguese origin, although it is probable that some of them may have been occupied by them during their early explorations, and to that temporary occupation may perhaps be referred those alterations in the original entrances and walls which have been noticed by travellers. One point in the description of De Barros has not yet been verified. He says: "Over the gate of the building is an inscription which neither the Moorish traders (that is, the Arab inhabitants of the coast) who were there, nor others learned in inscriptions, could read; nor does any one know in what character it was written."

This inscription, if it ever existed, could not be traced by Mauch, who says: "On a hasty visit to the very widely-spread parts of these ruins I was not able (by the removal of rubbish and fragments of stone) to light upon any inscriptions. I picked up no implements which would enable one to determine the age of the ruins; many, indeed all that could be laid hands upon, had been consumed by the present occupants of the country." But it would seem that there is a common tradition of the existence of inscriptions, for the Rev. A. Merensky, the missionary who was sent by the Missionary Society to explore part of this country, wrote in 1871:

"Natives warned our people that in the attempt to push on to the ruins we should all be murdered, because the Makwapa were in the habit of procuring different articles thence, and therefore kept them concealed from other tribes. We could not, however, ascertain what these articles were. A guide of the Banyai tribe told us much about this mysterious spot, and thus we gathered that the Banyai revere these ancient buildings; that no living creature may there be put to death, no tree destroyed, since everything is considered sacred. He also told us that a populous black tribe, acquainted with the use of firearms, had formerly dwelt there, but about fifty years before had gone northwards. We heard many details regarding the form and construction of these ancient piles and the inscriptions they bore, but I cannot answer for their truth."

Hitherto all attempts to unveil the mystery which enshrouds these remains of a vanished race have failed, no inscriptions have been met with, no distinctive weapons or ornaments, only fragments of rude pottery containing much mica, and stone basins with round stones much worn, such as are used by Kaffirs at the present day for crushing grain. Mr. A. A. Anderson, indeed, speaks of finding many copper beads in the sands of the river near one of the forts, but such beads are made and worn by the natives even now; he also

examined a grave, but found in it only a much decayed iron spear-head, and as almost all African races have been expert ironworkers from time immemorial that fact tells nothing. One thing alone is certain, that the builders of these fortresses, whoever they may have been, were actively engaged in gold digging, for in the neighbourhood of every one, old workings abound, and at the Tati, Mr. Dalton, a mining engineer, speaks of them as existing "literally in thousands," adding :

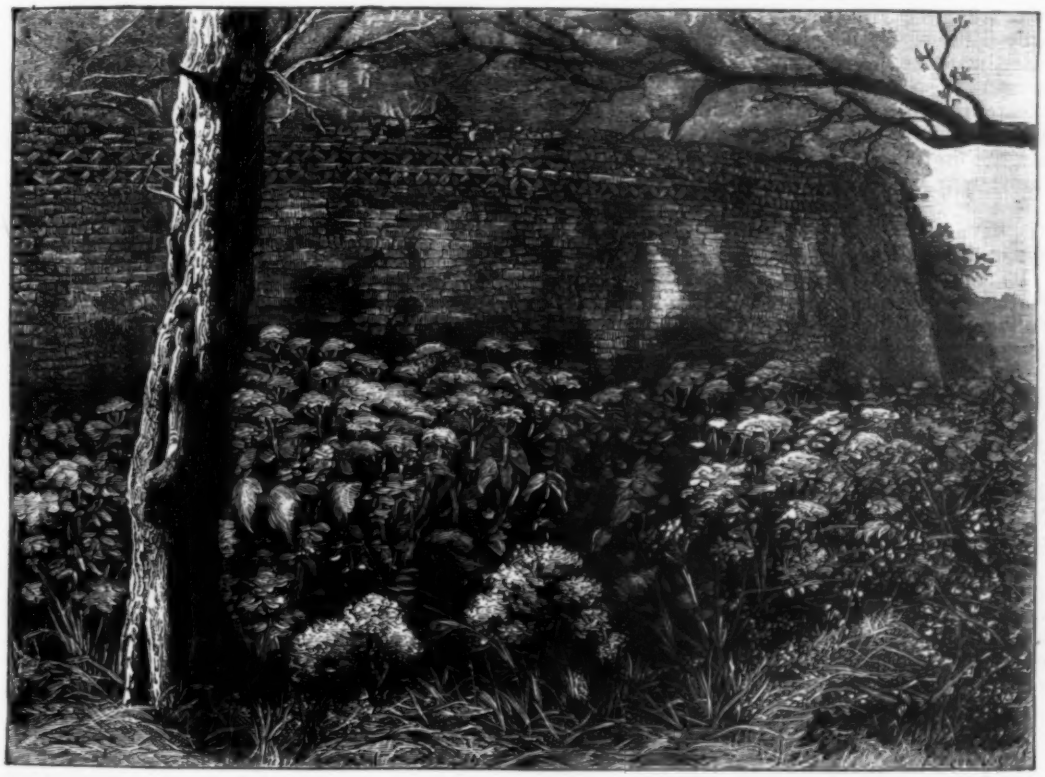
"They are said to be Portuguese, but I don't believe it. To give you an idea of their great age I may tell you that in the New Zealand shaft, the accumulations of time have filled it to within four feet of the surface, and yet the work was as good as any we can do with all our modern appliances. When we had stripped the reef of *débris* for twelve feet we came to flags of solid slate which we had some difficulty in removing. When we got them away there was a tremendous rush of foul air, which would have killed us had we not been so near the surface. The fresh air rushing in through the opening caused a big falling of rock into the hole below. After the commotion had subsided I went down forty feet with a rope, and then I rolled a boulder down to the bottom, which I judge was at least seventy feet farther."

Then he goes on to say :

"We never found any implements of iron in any of the old workings. The only thing we came across was an old assegai with a very thin blade, and barbed along its whole length, and I don't think there is anything like it between this and the Zambesi."

But this assegai also would, according to the description, appear to be the counterpart of one brought from Mashonaland, and exhibited at a late meeting of the Royal Geographical Society, at which the Zimbabye ruins were described and illustrated by limelight views.

It is satisfactory to know that the Royal Geographical Society and the British Association have agreed to send a skilled archæologist, in the person of Mr. Theodore Bent, to make a scientific examination of these remarkable ruins. Mr. Bent's report will be awaited with much interest, but his task will not be light, for he will have to encounter almost all the difficulties which have attended the explorations of Mauch, Baines, Anderson, and other travellers, and may possibly find even the powerful protection of the Chartered Company insufficient against the superstition of the natives, who will be outraged by an attempt to dig into their sacred enclosures. Lo Bengula, moreover, is so jealous of the search for gold, that Mr. Dalton, already quoted, relates that, having obtained permission to hunt elephants, for which purpose the king sent with him fifty of his own men, if he even attempted to take a little sand to rub his hands with, these men made him put it down again, for fear he should be looking for gold in it.



It is, however, possible that, should Mr. Bent be baulked in his attempt to explore the ruins of Zimbabye, he may yet find something to elucidate their origin by turning his attention to old gold workings in the Transvaal. About a year ago there appeared in several of the Cape papers what purported to be a *fac simile* of an inscription found on a stone in one of these old workings. The matter has never been thoroughly investigated, and it may have been simply a practical joke like that perpetrated on the Society of Antiquaries, and engraved and published in vol. ix. of the "Gentleman's Magazine"; but, if genuine, it would go far to bear out the long-cherished belief of antiquaries, that this is the land of Ophir, from which the gold for Solomon's Temple was procured, as the letters were undoubtedly Phœnician in character. Leaving, however, this inscription as too doubtful to be relied upon, it is yet certain that the old workings to be found in the Transvaal are worthy of scientific investigation ; some, indeed, may be Portuguese, but there are others which can only be referred to the same people who opened those at Tati and Zimbabye, and for the protection of which the forts now in ruins were constructed. The original prospectus of that now discredited mining company the Lisbon-Berlin contained an illustration of old workings on the property, with

CONICAL TOWER WITHIN THE RUINS.

an adjoining wall, which, in its construction of small blocks of hewn stone, would seem to resemble the Zimbabye ruins, whilst near by, we were told, was to be seen what appeared to be an ancient graveyard containing many pointed stones, upon which no inscription was visible.

Neither are these the only traces of a long vanished race to be found in South Central Africa, for Mr. A. A. Anderson reports the discovery in the Marico district of circular stone kraals, built, apparently like the ruins, of small hewn stones put together without mortar, with circular overlapping stone roofs closed by a single slab. The walls of these beehive huts are represented as nearly two feet thick, having also a stone door with lintels, sills, and door plates. Between each hut there is a straight stone wall five feet high, with doorways and lintels communicating with each square enclosure.

PART OF WALL, ZIMBABVE RUINS.

"They were," he says, "I believe, erected by the same people who worked the gold mines the remains of which we frequently find in the Transvaal and the Matabili, and beyond where so many of their forts still remain. In the Marico district there are two extensive remains of these stone towns, which must, from their extent, have occupied many years to complete. The outer wall that encloses the whole is six feet thick, and at the present time five feet high. Many large trees are growing out and through the roof of many of them . . . and they are so hidden by bush they are not seen until you are close upon them. Broken pieces of pottery are the only things I have discovered. The present natives know nothing of them, they are shrouded in mystery."[1]

And here it must be observed that the Kaffir tribes at present inhabiting this part of South Central Africa do not construct, and never have constructed, stone huts, and although they may sometimes pile stones together to form an enclosure, they certainly have never been known to hew stones and build them up systematically; therefore these forts and walls, these huts and enclosures of hewn stone, scattered here and there over an immense district, and everywhere thickly overgrown with large trees and bushes, were certainly not the work of any known Kaffir race; but whether their constructors were white or black has still to be determined.

Mr. Bent has expressed the opinion that they were the work of a Persian colony during the reign of Chosroes II. in the latter part of the sixth or beginning of the seventh century. Chosroes certainly made many conquests, notably in Egypt and Asia Minor, and is said to have been traced at Zanzibar, so that it is of course possible that he may have extended his conquests still further; but, if so, the Persian archives should yield some notice of it, and of the sums of gold, which must have been immense, obtained therefrom; for this was no hastily arranged and quickly terminated expedition—the ruins show a permanent occupation of the country in considerable force. The labour required to hew all these granite stones into brick-shaped blocks of uniform size, and to carefully build them into forts, houses, and defending walls and towers, must have been great, and must have occupied many years, whilst the ornamentation proves that strength and defence were not the only objects aimed at. The style of architecture is naturally the first thing to be studied in assigning a

[1] "Twenty-five Years in a Waggon," vol. i. p. 38.

race and a date to monuments like these, and certainly the small size of the stones used hardly suggests Phœnician work, but would seem more in accordance with the Persian theory of Mr. Bent; but there are other things than architecture deserving of study as ethnological data, for it is impossible that a race so civilised could have passed quite away without leaving something besides these silent ruins to attest their occupation.

The Kaffirs ascribe these ruins to a black or dark race, but European travellers almost invariably look upon them as the work of white people, and there are certainly tribes of very light colour to be met with in the interior, who may be offshoots of this ancient race. Graves, of course, yield valuable indications, whilst the weapons, implements, language, manners, and customs of the present inhabitants may also give a clue. The Mashonas appear to excel the other Kaffir tribes in mechanical skill; they are excellent metal workers and agriculturists, and are the only tribe south of the Zambesi who cultivate cotton and manufacture blankets from it, a fact noticed by Dos Santos, which knowledge may have descended from their civilised predecessors in the land.

It is quite evident, from the accounts of the Portuguese historians, that at the time of the Portuguese discovery these ancient cities were occupied by a dominant race called Moors and by their Caffre subjects, but it does not follow that the Moors (?) were the builders of them; on the contrary, it would seem that they were unaware of their impregnable character, and preferred trusting for defence to the neighbouring forests. Dos Santos does not say anything as to the colour of his Moors, but he hints at Chinese resemblances as regards manners and customs.

Enough has, however, been said to show the great interest attaching to these extensive ruins in the interior of savage Africa, and their exploration will be eagerly watched as likely to throw a flood of light on the ancient history of more than one continent.

A. W. BUCKLAND.

We are indebted for our illustrations to photographs taken by Mr. W. Ellerton Fry, late Lieutenant in the Pioneer Corps of the British South Africa Company. We append the following note from him as the testimony of a recent observer:

On August 15, accompanied by other officers, I obtained permission to visit the ruins of Zimbabye, about fourteen miles to the south east of Fort Victoria. Upon nearing the hill we were observed by some Mashonas. They, never having seen horses before, bolted up the hill and made signs to us to remain below. We shouted to them, and made signs for them to come down and talk with us, which after a little delay they did; upon asking them to show us the ruins they refused, and placed every obstacle in our way of seeing them; but eventually, seeing we were determined, they consented, upon the conditions that we were led to them blindfolded; but after further parley, and a present of a blanket to the chief, they showed us round the ruins, but not before they had concealed all their women.

The inhabitants live on the summit of a hill between three and four hundred feet high. The whole of this hill appears to have been surrounded by a series of walls which had evidently been built for defensive purposes. One of the ravines leading to the hill is entirely built across by a wall about fifty feet in height. This hill occupies a position commanding the whole of the country, and I should imagine had been used as a fortification.

On the plain below were found numerous ruins which appeared to be ruins of dwellings; the land also appeared as though it had been at some time under cultivation. Some little distance from the hill we came across a strange circular building situated on an elevated plateau; a massive structure, enclosing an area about 240 yards in circumference. The thickness of the walls at the base is about 15 ft., tapering to about 7 or 8 ft. at the top, and about 30 ft. high. For some distance on the eastern side the wall is ornamented by a double zigzag frieze or scroll, formed by the granite blocks of which the wall is built being placed in a diagonal position. Inside of this main wall is a second wall, about 8 ft. distant from the first, and then again a third wall about 20 ft. high, distant 8 ft. from the second. The effect of these high walls, with varying narrow passages between them, is most strange, and seen in the dim light caused by the thick foliage is singular in the extreme.

The strangest feature inside the circular building is a conical tower close to the eastern side, about 6 ft. from the main wall. This tower rises a little above the outside wall, at the base is about 15 ft. in diameter, and is built, as are all the walls, of cut and dressed granite stones beautifully laid in even courses without mortar or cement.

All the measurements given are by estimation, as in the dense undergrowth it was impossible to get actual measurements.

Other ruins were fallen in with at the Lundi River and at the junction of the Lotsani and Crocodile Rivers. These, although much smaller than at Zimbabye, were evidently built by the same people, as a similar frieze ornamental work was found, and it would appear that these people had come from the East coast and worked their way southwards.

# THE INCOMPLETE ADVENTURER.

BY TIGHE HOPKINS, AUTHOR OF "THE NUGENTS OF CARRICONNA," ETC.

'THE INSTITUTION OF DINNER MUST BE ABOLISHED

## CHAPTER XV.—A RECEPTION IN THE CITY.

WHAT a wonderful place the City is! It covers about one square mile, and there is not such another area in Europe. The Lord Mayor wears real ostrich feathers in his hat. An officer of the Guards keeps watch every night in the Bank of England, over the chamber where the bullion is stored. Who thinks of the private existence of the Bank porters? Within a radius of five hundred yards from the Royal Exchange, there are more new hats to be seen every day of the year than in Piccadilly or Rotten Row. Who pauses to look up at the beautiful spires and towers of Wren's churches? At five or six o'clock on every evening of the year, some one leaves the City richer by hundreds or by thousands than he entered it in the morning; and fewer tragedies happen in a week at Monte Carlo than are begun or ended every day in the City. Who has fathomed the inner lives of "bulls" and "bears"? When the markets are very brisk all the City knows their ways. But they have their inner and domestic lives; and in their own homes many of them rear fowl, or are very fine performers on the flute. There are trees growing in the City, and flowers and ivy in its churchyards; its streets are better swept and cleansed than those in any other part of London; bags of gold are carried up and down them in four-wheeled cabs; and sermons are preached in the churches on week-days, which may be one reason why the just men there have at least an equal chance of success with the unjust.

The sun was shining pleasantly on the golden cross of St. Paul's, on gay Cheapside, and on all the throng that strained, and pushed, and edged along there, when Guy and the sociable curate threaded

their way down the same thoroughfare towards the office of the capitalist in Throgmorton Street.

Guy was very gallant in new clothes, a complete suit, for he had yielded to his mother's petition that he would "wear them all together." He would willingly have sent the tr-s-rs to the club in Paris. As for young Mr. Craig, though no tailor had embellished him, his face proclaimed that he was not as he had been. Sometimes he forgot to answer Guy, he laughed when he need not have done so, he stood still and stared at nothing, and in other ways behaved as a man who has "lost his locality," and whose mind has temporarily ceased to act with his body.

"Have you any idea," said Guy, attempting for the third or fourth time to recall him to a sense of the situation, "what it is that we are here for? Am not I also in love? I will never call you 'Tom' again, as you have begged me to do, until I see that you can love in a manner proper to your profession. You are in love as Sancho Panza or Phipson Rae might be. Twice in five minutes you have proposed to take a wrong turning. You are the most disordered man I have ever seen. I think we had better call a cab."

"No, no, don't call a cab, Guy. I'll go quite straight now. Besides, we are ever so much too soon, you know; you would start an hour earlier than we needed to."

"If I had given you another hour in the garden," said Guy, "I should hardly have got you to start at all."

Thus they fared till they came to Throgmorton Street, where seven young Jews, wearing new hats on the backs of their heads, saluted them politely, and said: "Keep straight on for the Tower, gentlemen."

"Thank you," responded Guy, raising his hat, "the Tower is not our destination."

Groups of men were standing about on the pavement, in the roadway, and at the entrance to the Stock Exchange. Although they were of all ages, ranging from spruce beardless youths to brisk and merry patriarchs with long white beards, they all wore new hats on the backs of their heads, and patent-leather boots, and most of them had very short jackets with flowers in their button-holes. They were all very cheerful and alert, and perpetually asking the prices of things. At brief intervals, one of them would detach himself from a group, set his hat more firmly on the back of his head, and rush up and down saying that something had fallen a sixteenth or risen an eighth. An announcement of this sort always caused some movement in the various groups.

"There's my cousin!" said Mr. Craig to Guy, nodding in the direction of a group which they were approaching. "Dick!" he cried, "Dick!"

"Hallo, Tom, there you are! Your friend Mr. Warwick, I suppose? Happy to meet you, Mr. Warwick. Ready for a snack, both of you? I was just thinking about a snack myself." This was spoken with a very slight Cockney accent, by a pleasant and rather self-satisfied-looking young man of about four or five and thirty. He was of middle height, tending to stoutness, and clean-shaven; and he wore a new hat on the back of his head, a very short jacket with a flower in the button-hole, and patent-leather boots.

"Well, Dick, you did say something about lunch in your letter, I believe," replied Mr. Craig.

"So did you in yours, my boy, and quite right too. It's about time we had it, if you ask *me*."

Guy was formally introduced to Mr. Dick Evins, who at once inquired loudly for the powder.

Hereupon Mr. Craig observed that several of the new hats nearest to them began to bob, and their owners to show other signs of interest.

"There might be a big thing in that," continued Evins in the same tone; "and," dropping his voice, "I don't mind telling you that they're beginning to talk about it in the City."

The curate, whose face expressed a certain incipient doubt, took a glance at his cousin, but the capitalist wore a serious and sober air.

Several new hats now drew near to them, others followed, and presently Guy and the curate and the capitalist were the centre of a semicircle of shining hats.

"I am very glad to hear you say that," observed Guy. "For my own part, I felt convinced from the first that the success of this affair was destined to be in the nature of a revolution."

"What price shares?" cried one of the hats.

"I'll take a hundred!" cried another.

"I'll take any quantity," cried a third.

"Good old Rohand!" exclaimed a fourth.

"Guy and glory!" shouted a fifth.

The curate began to be uneasy, and knowing his cousin's propensity to practical joking, he nudged him and whispered, "Dick, what's the meaning of this? You're not going to play the fool with us, are you?"

"Keep quiet, Tom! The boys don't mean any harm. I told some of them about your letter, that's all. It's only their little joke. They thought Warwick ought to have a shout."

Guy, who did not hear this, looked a little perplexed, but by no means displeased. He drew himself up, and glanced composedly and with some pride at the twinkling countenances around him: standing a full head higher than most of those in the crowd.

"Tell us something about it!" said somebody.

"Shall I address these gentlemen?" asked Guy of Evins. "They seem interested. They are financiers, and friends of yours, I suppose?"

"Dick!" whispered Mr. Craig, "he must not do it. It's anything but fair."

"Keep quiet, Tom!" repeated his cousin in the same tone. "I tell you it's a chance for him. He's got the whole Stock Exchange before him, my boy."

Guy and his two companions were standing on the pavement immediately beneath a short flight of steps. Prompted by the capitalist, Guy went up the steps backwards, and took his hat off. All the hats beneath him wagged in approval, and a buzz of applause went round the circle.

"Gentlemen," began Guy, "I thank you for these expressions of your interest in the immense, the gigantic enterprise which has brought me amongst you to-day. They are in the highest degree creditable to you as financiers and as men

looking for a solution of the great alimentary problem."

He flung this out with musical emphasis, and then stopped abruptly. With no diminution of physical courage, his mind refused to frame another sentence. He looked out before him, cool and commanding, and with ardent gravity of face, but absolutely speechless.

The financiers made good the pause with a variety of commendatory noises. The young ones clapped, whistled, and rattled their hands in their hats. The beards of the gay old men shook with delight, and some of them thrust their hands into their pockets and danced in their patent-leathers.

Then remembering something of the prospectus which Trona had written in the garden, Guy straightened himself again, and galloped into that.

"I need not tell you, gentlemen" (the moment he began to speak he forgot the text of the prospectus, and used it merely as a theme), "that surprising strides have been made within the last few years in the manufacture of many descriptions of condensed and simple foods. But the food of foods has yet to be placed upon the market. Gentlemen, this is an age when men, with serious work to do, have little time to devote to the gross purposes of feeding. What man here can afford to spend one third of his life in dining? Can you think without remorse of three and twenty years sacrificed to the pleasures of the table? Gentlemen, the institution of dinner must be abolished. No one under forty years of age should ever consent to dine. Swallow a mouthful, and have done with it. Carry your dinner in your waistcoat-pocket, and let a pinch suffice you. Is this possible? It is. What is the substance? I have it with me, here. What are its properties? It is food and medicine in one. Has it been proved? It has. Who has proved it? I have proved it myself. Its uses are practically limitless. It is as good in the hospital as in the kitchen. Children, and soldiers on the march, may live by it. It is a sirloin of beef in the compass of a lozenge, a pharmacopœia of the size of a threepenny-piece. I shall retain the manufacture in my own hands, gentlemen; and I shall ensure its distribution at a price which will create an almost universal demand. Being more portable than air, it will be invaluable to travellers, sailors, soldiers, explorers, and—and—"

"Missionaries!"

"And missionaries. No missionary will be without it. May I add, gentlemen, in addressing an audience of business men, that I shall insist upon the allowance of a liberal discount to the trade?"

"You can't better that," said Evins, under cover of a general shout of laughter. "I don't think I'd say any more, if I were you. You've made an impression, as you can see and hear." Guy put on his hat, and descended to the pavement.

"Dick," said the curate, very angrily, "what do you mean by this?"

"My boy, he's done no harm," said the capitalist, imperturbably. "It may be a tip-top thing, for all this. Things were very quiet to-day, and the boys wanted a little joke. We're going to have lunch. We'll knock the facts about then. I shouldn't wonder if there's a fortune in it!"

"I wish I could have let those gentlemen know," said Guy to the curate, as they accompanied Evins to the restaurant, "that my speech was entirely Trona's."

### CHAPTER XVI.—PROGRESS.

EVINS took them to a glittering subterranean establishment, where he had previously secured a table; and seating his friends, he tipped his hat over his eye, and in bold tones ordered an elaborate luncheon, item by item, from the bill of fare.

"I don't know what's the matter with you," said Guy in a loud undertone to the curate. "You look as if you didn't half believe in it. Where is the support you owe me? Didn't you see how I shook those gentlemen?"

Mr. Craig did not, in fact, wear a very confident or gratulatory air.

"My dear Guy," he whispered, "it was a wonderful effort of yours, but one never quite knows what to make of the City. What I say is,—don't give yourself away."

Evins had brought several of his friends with him, to whom he introduced Guy.

"We won't call it business, you know," he said, "but let's have a bit of a chat about it. Let's knock the facts about a little. If you've got a good thing, Mr. Warwick, the city's the place to bring it to."

"What do *you* think?" responded all the financiers at table.

There were an American railway contractor; a Scotch lawyer, whom Evins, in a whisper, described as always able to lay his hand on an accommodating friend; the cousin of a broker who got some pickings from the Rothschilds; and a Spanish noble with a cold in his head, who was raising money for a waterworks at Alicante. There was a faint reminiscence of Cork in the accent of the Spanish noble, but whenever he sneezed (which he did frequently), he uttered the three pious exclamations which are always on the lips of devout Spaniards with colds in their heads.

All these gentlemen were very serious and disinterested.

"You see, Mr. Warwick" said Evins, "the first thing a capitalist would want to know would be this, what has the powder done?"

Mr. Craig gave Guy an admonitory kick under the table, but he forgot that in his letter to his cousin he had dwelt confidingly upon the surprising cure of M. Rohand's granddaughter.

"I should have no difficulty in answering that," said Guy. "I will not speak of my own case (though that will be referred to in the prospectus); there is a much more remarkable one which will serve every purpose of illustration. I shall tell you of the case of M. Rohand's granddaughter."

The Spanish noble asked her age, and whether she were married.

"Pardon me, but that is not the immediate question," said Guy. "The principal thing is that the young lady is now able to walk as well as ever she did in her life."

"I don't doubt but this was a great cure, any way," observed the American railway contractor; "*but*, you'll *ex*-cuse me, sir, no Pahris lady knows how to walk worth anything. That's so, gentlemen."

"That," answered Guy politely, "is a question which I am perfectly prepared to discuss; but is this the moment?"

"I as-*sert*," said the American, with soft, nasal insistence, "that there isn't any lady can walk *per*-fectly, *un-less* she's got a *per*-fect foot. Now the French don't *have* perfect feet."

The Spanish noble acquiesced in this, and insisted that Spain and the South of Ireland produced the ideal foot. There must be Moorish blood, he said, with a far-off reminder of Cork in his accent, to produce the ideal foot.

"Gentlemen," said Guy, earnestly, "will you permit me to state the case of M. Rohand's granddaughter?"

"And where's the Scotch foot?" inquired the lawyer, opening his lips for the first time.

"Spreading," said the cousin of the Rothschild broker.

"The Amer'can foot"—began the railway contractor.

"Oh! I say now, we're not going to quarrel about it," said Evins, "but for a good all-round foot—"

"I venture to say," put in Mr. Craig, "that the perfect foot is the foot which is best proportioned to the rest of the frame."

"That's what I say!" chorussed all the financiers together.

"Look here, Mr. Warwick," said Evins gravely, "give me a quiet call at my office some morning. These things want a lot of talking over."

As Evins was settling the bill, Colonel Capperley entered the restaurant.

### CHAPTER XVII.—HOW THE COLONEL AND HIS FRIEND THOUGHT IT SHOULD BE DONE.

COLONEL CAPPERLEY was accompanied by a short gentleman who wore gold-rimmed glasses on a slightly Jewish nose, and whose crisp black whiskers embraced his cheeks closely.

The Colonel flourished his hand at Guy, with a friendly smile, and was passing on to another table; but Mr. Evins's party were dispersing, and Guy approached the philanthropic financier.

"You have not forgotten your engagement with me?" said Colonel Capperley. "The hour is three. Have you lunched, or will you do us the pleasure? Permit me: Mr. Abelson, Mr. Warwick."

"Pleasure, pleasure, I'm sure," murmured the gentleman with the gold glasses, as he bowed to Guy.

"Mr. Abelson will be with us," observed Colonel Capperley. "I have aroused his interest in your project, Mr. Warwick. A gentleman more familiar than yourself with the financial world would recognise the name of Abelson."

"I am certain," said Guy, "that Mr. Abelson will pardon my ignorance. I am indeed unfamiliar with the world of finance, but I have to-day had a touching proof of its eagerness in a great popular cause. Mr. Abelson, we shall, I trust, know more of each other."

"We're going to, we're going to," responded Mr. Abelson, who spoke a little thickly. "I want to hear about this. When Capperley, Colonel Capperley, mentions a thing to me, I want to hear more of it at once."

"But we are keeping you from your friends," said Colonel Capperley, observing that Evins and Mr. Craig were waiting in the doorway.

Guy turned to them.

"Don't lose the Colonel," said Evins. "Business first here. You know where to find me. I'll take Tom off; drop in for a *chasse* when you've finished with the Colonel. So long!"

"I think," said Guy, "that I ought to make some return to the members of the Stock Exchange."

"I'll tell them that," said Evins. "They'll like to hear it; they'd enjoy a quiet cup of tea with you."

"Sorry indeed that you have lunched already, Mr. Warwick," said Colonel Capperley, as Guy returned to the table. "But suppose we proceed with our subject. The analyst presented his report yesterday."

"I concluded that he had done so when I received your telegram," replied Guy.

"Yes, I read the report, and I communicated with you. I am not dissatisfied with the report. How I wish that reports were everything! The honest opinion of a competent analyst should enable us to get to work at once."

"Have you got the report with you?" asked Guy.

"I should have it," returned the Colonel, seeking in his breast pocket. "No, it is not there. Did I give it to you, Abelson? Then I must have left it at the office. No matter; the opinion of the analyst is not unfavourable."

"Then what do you propose to do?" inquired Guy.

"I have discussed the project with Mr. Abelson," answered the Colonel, "and we are of opinion that there is a chance."

"A chance?" queried Guy.

"In the great morass of speculation," said Colonel Capperley, "the most experienced adventurer has no more than a chance of reaching *terra firma*."

"It's float or sink, don't you *thee*?" said Mr. Abelson, who modified the language a little when his tone was warm.

"That may be," responded Guy; "but what are your proposals, gentlemen?"

"Are you prepared to manufacture the powder?" asked Colonel Capperley.

"I am here for no other purpose," answered Guy.

"To be sure," said Colonel Capperley, "to be sure! The letter which I had the pleasure to receive from you this morning put me in possession of much interesting information on the subject. A most touching recital, that respecting M. Rohand and his granddaughter. We should require to test

the substance somewhat more extensively, of course, and there would be many preliminary questions to settle concerning the mode and cost of manufacture, and so forth. But for the moment, and waiving these and other considerations, let us try to take a little peep into the future. We want," continued Colonel Capperley, his voice breaking a little as he said it, "we want to reach the people—the masses. Mr. Abelson thinks with me that the masses are in need of something. If, for example, we could send the labouring-man forth to his labour with all the sustenance he required for the day bestowed in his waistcoat pocket!"

"Which we could do, of course!" exclaimed Guy, rapping the table with nervous animation.

"Think we could, eh?" asked Mr. Abelson.

"I am perfectly persuaded of it," answered Guy, emphatically.

"In that case," continued Colonel Capperley, "it would of course be the very thing for the masses. There is the agricultural labourer, now. That is a man whom I should like to feed on a novel and inexpensive principle."

"And cure him," said Mr. Abelson.

"Yes," added Colonel Capperley, "and cure him. He is often, I believe, a great sufferer."

"He's an agricultural labourer," said Mr. Abelson excitedly, "so he mutht thuffer! Rheumatism, Capperley; ague, lumbago, gout—he hath them all!"

"And to think," exclaimed Colonel Capperley, "that in health he might dine upon, and in sickness might medicine himself with this simple preparation! It is a great thought. Mr. Warwick, what do you say?"

"It is precisely what I have had in mind from the first," answered Guy. "These are the feelings I tried to rouse in M. Rohand. But what is your scheme? How does it begin?"

"Something in the nature of a small syndicate, to start with, I think," replied Colonel Capperley slowly. "That is Mr. Abelson's fancy, too."

"Throw off in the country," said Mr. Abelson. "That's where your start should be made with this kind of thing. A caravan's my notion. Open shop in the market-place, with a big drum in front. I'd have a whole brass band, and a chap to draw teeth. Throw in painless dentistry with the powder."

"But—but who is going to do all this?" asked Guy, open-eyed.

"Why, I'd do it myself, if I were you," said Mr. Abelson. "You've just the figure for it: hair the right length, too. A fur coat and a diamond ring, and there you are! You'd take fifty pounds a day. Do you think you could draw teeth?"

Guy's expression, mingled of astonishment and rising indignation, was imperfectly translated by Mr. Abelson.

"Or you might go round as a Buddhist," he continued; his countenance bespeaking the best of faith. "The agricultural labourer—well, he likes a little bit of hocus-pocus. A Buddhist with a brass band would fetch the whole country."

"But this would be rank quackery!" cried Guy.

"Quackery!" returned Mr. Abelson. "Quackery, Mr. Warwick! The word hathn't a plath in the dicthionary of commerth."

But Colonel Capperley himself looked a trifle concerned.

"I think," he said gently, "I think I gather the drift—the inner meaning rather—of Mr. Abelson's suggestion. A Buddhist? A band? Even a brass band? H'm! No, perhaps not exactly. Yet I am not positive. The agricultural labourer is not quite on our plane, you see, Mr. Warwick. How to approach him? How to touch his imagination? Relatively, he is a child Really now, do you think that he has advanced far beyond the magic-lantern stage of intellectual development? I fear that the rural clergy are still plying him with the magic lantern. If with the magic lantern, why not also with the magic drug?"

"But this is *not* a magic drug!" retorted Guy.

"Certainly not," said Colonel Capperley mildly. "It is nothing of the kind. But for the good of the simple toiler in the fields we may throw a little mystery around it, as we persuade children that their medicine is orange-juice or honey."

"I cannot entertain this notion for a moment," persisted Guy. "I stand upon the merits of the powder."

"The merits are all right," said Mr. Abelson; "but you've got to preach them in. The big drum's the thing to preach them in with. The medicine-man is your notion in this line, and you can't take the country towns without a caravan and a band. You give a little performance for a local charity to begin with, and then you've taken the wind out of the sails of the show people (you'll have them against you everywhere), and you'll draw all the money in the town."

Guy rose from the table, blazing.

"I will have nothing to say to this!" cried he, with a sort of halloo of wrath.

Colonel Capperley extended a soothing hand. "As yet," said the Colonel, "we have barely broached the subject. I would have you think, Mr. Warwick, of the universal interest that would be aroused in it, when we had engaged the sympathies of the press. What newspaper press in the world is so ready as ours to accept an invitation to luncheon in the interests of the poor and struggling? I have always found the London press peculiarly susceptible to an appeal of this sort. We invite all the editors to lunch with us. We talk to them over a glass of champagne, and present them each with a packet of the powder. An expenditure of £60 on a cold collation throws Fleet Street into a St. Vitus's dance of philanthropic zeal. The press is with us. We form a private syndicate to put our affair upon the road, and in twelve months or so we are in a position to sell to a limited liability company, with a capital of half a million."

"That's the notion," said Mr. Abelson. "Yeth, that'th it!"

"I am utterly and entirely opposed to this whole scheme, and every detail of it!" exclaimed Guy, with great warmth. "Nothing would induce me to go to work in this fashion. I would rather abandon the enterprise at once and for ever, than consent to conduct it on this thimble-rig principle. Do you think, gentlemen, that I would allow the name of M. Rohand to be flaunted on the caravan of a cheap-jack, and that I myself would flourish a

pestle on a platform in market-places? I will not bamboozle the agricultural labourer, and I will not draw his teeth. I will be no party to drugging the press. Nothing can be more unfair than to invite some poor hungry editor as a gentleman to your table, to treat him with civility and kindness, and confuse him with unaccustomed wines, with the deliberate purpose of suborning his pen. Gentlemen, I beg to decline your proposals."

In another moment Guy had taken his hat, and vanished. Colonel Capperley and Mr. Abelson continued their luncheon.

Guy went at a vehement pace in the direction of Waterloo. He had forgotten or was careless of his second engagement with Evins; he did not give a thought to the curate. His chief desire was to get out of the city, against which he had conceived a sudden and violent animosity.

"I shall certainly not come here again," he said. "A low and unprincipled business, whichever way it is looked at. A pair of jack-puddings, if ever I heard of such! No more financial mountebanks. *Nom d'un chien!* Ah! my dear old Rohand, what an escape for us! Imagine! And in the name of guile, why a Buddhist? A little louder with the big drum, there; another blast on the trombone, please! Now walk up, my agricultural friend, walk up, walk up! I am the Wild Man of Poplar, recently come from Tibet expressly to cure you! I have a magic drug here, which grows only in the eighth region of the mountains of Barcelona, in Tibet, where no human foot has ever trod. What are you staring at? Have you never seen a Buddhist before? Open your mouth and let me see if you want any teeth drawn! This is Mendez Pinto Capperley, my assistant, from the principal Courts of Europe. Hand me those forceps, Mendez Pinto, and if he screams, wake up the band; this is painless dentistry.—O Cagliostro, if you were before me now, I would kick you into the Polar basin!"

At this moment, Guy himself narrowly escaped being kicked into the window of a music-shop on Ludgate Hill, by a horse which was being led plunging from the broken shafts of a hansom-cab. He backed into the doorway of the shop to save himself. While pausing there, he saw his mother and Grace hailing an omnibus on the other side of the road. Grace carried a small portmanteau, and kept watch over a shoe-black beside her, who had a larger one on his shoulder.

"Now where in the world are my mother and sister flying?" thought Guy, as he hurried across the road to join them.

"Oh, my dear boy," exclaimed Mrs. Warwick, "how very fortunate, your poor Uncle George, I fear, is dying. Not that that is fortunate, of course. He has always been the kindest brother to me, and I really never minded his being a little late with the dividends, though it was sometimes a little awkward at the moment. Grace, dear, you are letting every omnibus go by. You see, Guy dear, we were telegraphed for, soon after you had started, and I thought that if we took an omnibus, and went on the outside, as so many ladies do nowadays, we might possibly see you somewhere in the City on our way to Liverpool Street."

"But now that Guy has come, mamma, we might take a cab."

"Yes, dear, of course; and Guy, do ask the man to drive slowly through St. Paul's Churchyard. I suppose we ought to drive that way, though I do hope there may be nothing ominous in it. What I mean is, that we are so little prepared for the worst, and I thought that if the man were to drive slowly, and Grace were to keep a look-out for milliners' shops—"

Here Guy placed his mother gently in a four-wheeled cab; Grace and the portmanteaus followed, and Guy after them.

"What have you done with Mr. Craig, Guy?" inquired Grace.

"And, Guy dear, have you settled everything?" added his mother.

"Ask me nothing, my dear friends," said Guy. "Our future is an absolute blank."

"Stop the cab," said Mrs. Warwick. "There is the very shop where I bought my mourning for your dear father."

### CHAPTER XVIII.—INCOMPLETE.

MISS GAULT read the City article and passed on to the Fashions without getting much entertainment from either. Yet she had nothing but this newspaper to amuse her. Why nobody wrote to her or called upon her she could not imagine. By "nobody" she meant Guy, his sister, and his mother. She had neither seen nor heard of them for a week, and of course, therefore, knew nothing concerning the progress of the scheme.

Her private belief was that the scheme would not progress at all while it lacked her counsel and assistance. And to be obliged to sit there idle, solely because of her sex!

"Of course, we women will have our own Stock Exchange before very long," she reflected. "That *must* be the next 'opening' for us if you come to think of it; it's so impulsive, and trustful, and round-the-corner. You offer to sell something that you haven't got, and then you go and buy it at a bargain from somebody else without paying for it. I don't think real money comes into it at all; it seems just the thing for women without private means."

Then she fell to wondering what success Guy had had with the cousin of the curate. The curate himself engaged her thoughts for a moment, and she considered it singular that, as she was the only heiress in the neighbourhood, the curate had never proposed to marry her. Then she remembered that a mother of seven daughters had recently written to the editor of a daily paper to inquire why it was that "even curates had ceased to propose nowadays."

She returned to Guy. Guy had proposed, at all events. He had omitted the preliminaries, but he had certainly proposed. *Had* he proposed? Undoubtedly he had; but *had* he? There was no question that he sang divinely.

He ought to have repeated it in a letter. She

reflected, with a kind of surprise, that she had never seen his handwriting. She wondered whether he wrote carefully or anyhow.

How should she amass the fortune which she intended to make? She wished that she were president of a women's Stock Exchange. Properly exploited, there ought to be several fortunes in M. Rohand's powder. If her father had not quarrelled with it, she would have persuaded him to invite M. Rohand to stay with them. It would, of course, have been necessary to invite Guy to meet M. Rohand. She arranged an appropriate dinner for Guy and M. Rohand. She wondered whether M. Rohand had a dress suit. What a prince Guy would look in a dress suit! She wished that men of genius would consent not to have their clothes made on principles of their own. If M. Rohand stayed with them, would her father insist on asking Phipson to meet him? When did Phipson intend to marry? He had never mentioned any one to her, which could only mean that she herself was in Phipson's mind. Phipson, moreover, was in her father's mind, she had no doubt of that. She wondered why elopements had gone out of fashion, and what she should do if Guy, dressed in a long cloak and a feather in his hat, were to sing something romantic under her window one night, and whether the tricycle would carry two.

If Guy did not come in a long cloak one night, Phipson would certainly come one day in a more conventional guise; and, considering Phipson's skill in prescribing for her father, had she any respectable reason for rejecting him?

Ought you to allow your father the ancient privilege of barter, or tell him that marriage, like the poor law, is struggling towards a civilised and humane ideal?

She pictured herself in the act of receiving the formal addresses of Phipson. There would certainly be nothing to reproach Phipson with on the score of propriety. He would not omit the preliminaries. She had never set so little value on the preliminaries as she did at that moment.

Having reflected thus far, she admitted to herself that all her reflections were rubbish. What was worse (she admitted this also), they were quite insincere. She wanted news of Guy.

To obtain news of him she had written to Phipson. She could not quite write to Guy himself, and she had lacked the courage to write to his mother or his sister. It was improbable that Phipson could tell her much, but he might tell her something. Trona had therefore written him a pageful of questions about Guy without the slightest mention of Guy's name.

Phipson, who was the most sociable of men, had interpreted the letter as an invitation to dinner. It was in this way that he always interpreted an intimate question in a letter. As a careful man, who liked to have the best of an emergency, he packed a handbag, in case he should miss the last train to town.

"So there you are!" said Trona, who did not know whether she were moderately pleased or very angry. "Put your bag down. Why didn't you give it to somebody? You'd like some tea, wouldn't you? I expected a letter from you."

"'T would have been by telegraph then; for I didn't get your own till this morning. I would, to be sure."

"Does that mean tea?" said Trona. "I forgot I only wrote last night. Let me see, what did I write about?"

"It was about something, I know; you'd write about something, of course. Let me think now."

"I'm excessively cross, Phipson."

"Well, sure, I couldn't help it. I declare I hadn't a hand in it at all."

"In what? What are you talking about, Phip?"

"That's me, dear Trona! See how you soften me when you call me 'Phip!' What was I going to tell you?"

"If you have anything at all to tell me, tell it at once. What was it that you couldn't help? Have you done anything wicked about Mr. Warwick's scheme?"

"I knew nothing about it till I read it in the paper three days ago."

Trona began to be indignantly alarmed. "What in the world are you talking about?" she asked.

"I'm glad you've heard nothing," said Phipson. "'Twas a bit of a joke, no doubt, and nothing else. But I was afraid of it from the first, when he told me he meant to take it into the City himself. You see, he's just the best fellow that ever was, but this isn't his walk at all. They were bound to take a rise out of him."

"I haven't the very smallest idea what you are talking about," said Trona, with ever-increasing alarm. "Do you mean that those people in the City have been joking with Mr. Warwick?"

Phipson took a paper from his pocket and handed it to Trona, indicating a paragraph which he had marked in pencil. Trona skimmed it hurriedly, gave a vicious little glance at Phipson, and then read the paragraph again with unwilling and resentful deliberation. It was the first paragraph in the "gossip" column of a City journal, and it shaped thus:

"I am often asked by novices how I should go to work if I wanted to float a company. Well, you may do it in many ways. The great thing is to know how to take the City.

"If you don't know how to do that, you may tramp between Aldgate Pump and the Royal Exchange daily for a twelvemonth, and do no good to anybody except your shoemaker. A sadly humorous case in point was furnished only last week. An amiable young man, who had somehow provided himself with an introduction to an active member of the Stock Exchange, found his way into Throgmorton Street with a scheme to float a new thing in patent medicines, which he had picked up somewhere in Spain or South America. Now there's no doubt that patent medicines, nicely worked, may be turned into a very choice property just now. My own notion would be, a small syndicate to put a caravan on the road, with a North American Indian and a little native music to work the show; and the country towns would be at your mercy. But the amateur philanthropist who wanted to take Throgmorton Street by storm last week lost his locality, so to speak, and—well, that was a gay spectacle when he mounted the steps of —— and

Sons to harangue the Stock Exchange on the expediency of doing away with dinner."

Trona read no further. She tore the paper in half and thrust the pieces under her foot.

Phipson was not wanting in sympathy (what non-political Irishman is?), and for the first time in his life he regretted that he had interpreted an intimate question in a letter as an invitation to dinner. He did a very magnanimous thing. He forebore, on Trona's account, and on Guy's, to ask the hand of his cousin.

Trona was much too angry with the Stock Exchange to appreciate her cousin's forbearance, even if she had guessed it. She ground the paper under her foot and did nothing else. But she might at any moment have said something unkind to Phipson, had not somebody else come upon the scene.

Guy entered the garden, tranquil and self-contained; a little more quietly than usual, perhaps, but with unabated authority of air.

"Oh," exclaimed Trona, "I'm really very glad to see you. I was almost beginning to think that you were offended with us. I don't fancy papa has been at all so well since he left off the powder. Has anything happened since—since you were in the City?"

"A most unfortunate visit, that," said Guy.

"I wouldn't give a thought to it," observed Phipson.

"After all, you know, it was only their absurd fun," added Trona. "They never meant you to take it seriously. I daresay, if you had seen one of them afterwards in his office, he would have behaved very differently."

"I fear not," said Guy. "No, they were entirely serious. The Buddhist and the brass band were a most deliberate proposal. However, I'm not annoyed about that any longer. You see, I had had a much more gratifying experience just before. I have made up my mind to go down to those Stock Exchange men again. If you had heard how they cheered me!"

Trona, mystified into silence, stole an inquiring glance at Phipson. But Phipson's face was vacant; he also was mystified. The *flâneur* of the City journal had not followed Guy to the restaurant.

"I intend now," continued Guy, "to float my company myself."

"Then you have secured the money to buy the secret?" queried Trona.

"It has been secured for me," said Guy. "Whew!" cried he, borne out of himself for a moment by the intoxication of sudden and unexpected wealth. "Everything is changed. Everything is new. I have become my own uncle. I am what my uncle was ten days ago. He is dead, but I live, and all that was his is mine."

Then he quieted a little, and told them how his uncle had died and passed his thousands on to him.

"It is a desperately immoral business," said Guy, "for no man deserves to become rich in this way. On the other hand, it is a very immoral thing to save money by the hundred thousand. The greater your possessions, the more imperative your duty to spend. How do you know in what manner they will be spent when you are dead? My uncle, in his beneficent un-wisdom (for he knew me only as a failure), has bequeathed me a very large fortune. I shall do my best to rectify his mistakes, for I do not intend to leave a penny of it behind me. I have written to M. Rohand, who will be here, I hope, to-morrow."

"Let us have a prospectus ready for him," said Trona. "Let us make a new one at once."

"Are you sure that he'll come?" asked Phipson.

* * *

Mrs. Warwick put a letter into Guy's hand when he returned home, saying that, as she had noticed the Paris postmark, she had given out the sheets to be aired for M. Rohand's bed.

The letter was from Armand, and it began thus: "Alas, my friend, for the secret of the powder! The old Rohand died suddenly last night."

## INCIDENTS OF THE GREAT FROST OF 1890–91.

IN due time there will appear from meteorologists and men of science, formal reports about the extraordinary frost of 1890–91. Our present purpose is to note some miscellaneous incidents of this memorable season, viewed apart from the strictly scientific records.

Beginning with the serious question of the influence of the severe and long continued frost on human life, and on the bills of mortality, it is to be feared that the year's record of death-rates will be found abnormally high. The Registrar-General announced that in London the rate for several successive weeks was 29 per thousand, and in one week 29·2; the average weekly rate during a year being only about 21. In that worst week the deaths numbered 2513, or 465 more than the average. This excess was almost entirely due to increase in fatal cases of diseases of the respiratory organs, for the deaths from these causes alone were set down at 1018, or 412 more than the average of a week's mortality.

There was an excessively high death-rate not only in London, where the cold was made worse on some days by smoke-laden fog, but almost everywhere throughout the United Kingdom. The reports from most parts of the Continent showed similarly excessive rates of mortality, and everywhere the number of aged persons carried off was large. One obituary list in the *Times* contained upwards of twenty persons from 80 to 95 years of age. Without accurate statistical reports it is needless to dwell upon this topic, but the fact is clear that the death-rate due to the frost has been excessive.

As is always the case in the story of human life, there are incidents of an almost humorous nature even amidst the tragic and sad records of mortality. At the meeting of the Cemetery Company of one of the large provincial towns, the Secretary, without

any intention of levity or irreverence, was "able to congratulate the Board on the business rapidly increasing," to the obvious benefit of the shareholders! Those who have ever been present during a criminal trial involving the awful issues of life or death must have been struck by the almost irrepressible titter through the court, when any remark or incident occurs to give relief to the strained solemnity of the proceedings. It was an experience of the same kind in that Cemetery meeting, when the Secretary's congratulations caused momentary applause, followed by slight laughter, till cries of "Oh, oh," recalled the audience to propriety of manner. The statement, however, that the month of December was "the best month," and the January week when the Board met was "the best week the Company ever had," too sadly confirms the account of the fatal effects of the frost.

The mortality of the season extended to the lower animals as well as to man. In one of the snowstorms many thousands of sheep are said to have perished. This was in the northern regions of England, while the curious report was given from the south coasts, where even the sea was partially frozen, that thousands of star-fish, eels, crabs, and other kinds of marine animals were found dead on the icy shore. In the Jardin des Plantes almost all the deer tribe, buffaloes, and other herbivoræ perished. The poor Manatee or "Mermaid," which was a popular attraction at the Brighton Aquarium, died in the early part of the year from the cold and want of sufficient succulent vegetables.

A DROP OF LONDON WATER DRAWN FROM THE SERPENTINE.

*January* 1891.

There were also numerous individual cases, in various parts, of people frozen to death, or buried by snow, during the severe season.

As to amusements, the continuance of ice for

skaters, through nearly eight successive weeks, with little interruption by thaw, is a rare event in our English climate.

Our Canadian cousins are familiar with ice festivals and frost carnivals, but it is not a usual thing to have every pond and river and canal in our island frozen as deep as the lakes of Sweden or the canals of Holland. It was estimated that on one day, in the Metropolitan district alone, there were above 100,000 persons skating or sliding. At Oxford on the Monday before the breaking up of the frost, the 21st January, the river, opposite Christ Church Meadows, where the College barges are moored, was densely packed with people, skating, walking, riding bicycles and tricycles, and actually a coach and four was driven up and down for a long time. It was easy to skate down to Sandford, to which place it is common to row or paddle in ordinary years at the same date. What was done at Oxford is but given as a sample of such scenes all over England, festivities of every kind being held upon the solidly strong ice in the middle of January.

In London there were hundreds of thousands of healthy people who enjoyed the weather which was causing death and distress to those less favoured. To have got no hunting for nearly two months was a cruel disappointment to the rich, but then the same frost brought enforced idleness and sad poverty to vast multitudes of labourers, both in town and country.

The efforts to relieve this distress and lessen this suffering will be recorded among the brightest incidents of the frost. Every Society for aiding the poor has been quickened into busy activity in charity suited to the occasion, with the results that no appreciable intensity of suffering nor increase of rate-supported pauperism marks this season beyond many in times not remote. In some points the need has been demonstrated of forms of relief and help in addition to the routine arrangements of the Poor-Law.

In France, and other continental countries, the authorities are in advance of us in this care for destitute outcasts. In Paris shelters were open, and food supplied, and cheerful fires kept burning, most of them in the open streets. The French Government, and the Municipality of Paris, voted large sums for this good work of charity. At the height of the distress, the French Senate and Chamber of Deputies voted large sums, at first 80,000*l.*, and shortly afterwards 160,000*l.*, without dissentient voice. The usual formalities were dispensed with, and the vote was made one of urgency. Among other humane measures occurring to the Government, it was announced that prisoners in custody, undergoing light sentences, and about to be released, might remain in prison till the severity of the weather relaxed, and above 700 availed themselves of the privilege.

Some of the picturesque effects of the frost must not remain unnoticed. No one can conceive the beauty of the scenes on some of the upper reaches of the Thames, as near Kew and Isleworth, Chiswick and Richmond. All along the banks of the river huge masses of ice were heaped in irregular confusion. At every tide the broken ice was washed on to the banks, and left there by the ebbing waters. When fresh snow fell, and the sky was blue, as it often was during the frost, the effects were marvellous; and most lovely was the spectacle when the setting rays of the sun, often gorgeously coloured, lit up the frozen masses with variegated hues. How Turner would have revelled in the glow and play of colour, on land and sky, beside his favourite river! Vast flocks of birds frequented the banks at low water, and kittiwakes and other sea-fowl were flying over the stream. The miniature icebergs floating with the tide gleamed with iridescent colours in the sun-setting splendour.

The picturesque effects during the frost were enjoyed in many countries. The French feuilletonists were eloquent about the scenes on the Seine, and in the forests and streets, where hundreds of fires produced grand night effects. The Bois de Boulogne, and above all the Champ de Mars, where multitudes of the poor flocked to the shelters and fires, presented strangely picturesque sights. The poor creatures were starved and poorly clad, but order and cheerfulness prevailed, and the duty of the municipal police was confined to seeing fair play given to the weakest and poorest clad, to have their turn at the braziers and stoves, where the soup cauldrons were kept warm night and day. A correspondent of the *Daily News*, who spent a night in the Champ de Mars, said that this prompt relief of the poor was more honourable to the Government than all the triumphs of the Great Exhibition. The Eiffel Tower looked gigantic and stately amidst the snow, but there was a homelier delight in seeing the windows of the Palace of Fine Arts and other buildings flushed with the ruddy glow from the fires round which the outcasts of underground Paris were enjoying the comforts of warmth and food.

The immense area of the atmospheric season of chill was more notable in this, than in any previous frost in modern times. Snow fell and remained long in Algiers and Tunis as well as in Spain and Hungary. In Vienna there has been no winter so severe since that of 1829–30. The Campagna of Rome, and the hills in sight of the Capitol, were long covered with snow, and descriptions of winter scenes by Horace and other writers were literally true, however the climate may have changed since old classical times in Italy.

Many minor "miseries of human life" might be referred to, but our space is exhausted. In London there were acres of houses without any water but what was drawn from the tubes fixed in the roads connected with the deep mains. At Oxford it was common to turn the parlour or library into a temporary kitchen. Water was carted from the Seine to St. Cloud and Versailles, and sold there at half a franc a gallon. It was well when London mansions escaped with inconveniences, and with no other damage than that caused by the freezing of cisterns or bursting of pipes. A little prolongation of the frost, especially if accompanied by snow, might have resulted in famine, or at least in famine prices. Let us be thankful that the Gulf Stream still flows toward our shores, and that north-east winds are not unchangeable in their arctic rigour.

# THE FRIENDSHIPS OF LORD HOUGHTON.[1]

THE father of Richard Monckton Milnes, first Lord Houghton, was a wealthy Yorkshire landowner, whose ancestors had won their fortune in the cloth trade. When a young man, the greatest prizes of ambition appeared to be within his reach. His college career was a brilliant one; at the early age of twenty-two he took his seat in the House of Commons as one of the members for Pontefract, and, before he had been many months in Parliament, made a speech that electrified the House. A year later he was happily married, and at twenty-six the Prime Minister, Mr. Perceval, offered him the choice of a seat in the Cabinet, either as Chancellor of the Exchequer, or Secretary of War. "Mr. Milnes," his wife wrote, "immediately said, 'Oh, no; I will not accept either; with my temperament, I should be dead in a year.' I knelt and entreated that he should, and represented it might be an advantage to our little boy—please God he lived; but all was to no purpose, and he went up to London to decline the most flattering and distinguished compliment ever known to have been paid to so young a man." Henceforth, though his interest in public affairs never abated, he devoted himself chiefly to the duties of a country gentleman. One of the most handsome men of his time, he was also one of the most accomplished, but "his career left the promise of his youth wholly unfulfilled."

Like his father, Richard Monckton Milnes failed to reap the fruit that might have been expected from his brilliant powers. With great gifts of fortune and intellect, with no slight share of genius, and, unlike the elder Milnes, with ample ambition, he never attained the position he coveted in political life, and, good though his place may be in literature, no one nowadays would rank him with the great authors of the century. His knowledge was immense, he studied affairs and he studied books. Continental politics were as familiar to him as those of his own country; he was in constant intercourse with statesmen and diplomatists, and with men of the highest literary eminence; he travelled widely, and knew every one worth knowing; he was blessed with a ready pen and an eloquent tongue, and became, too, by no mean arts, one of the best known men in England; and yet those who knew him best felt that there was, so far as the chief objects of worldly ambition are concerned, the stamp of failure upon Milnes. "I often wonder what will be your future destiny, and I think you are near something very glorious, but you will never reach it," wrote a college friend in 1830, and the prophecy proved true.

It would be unjust, however, to write of Milnes as a disappointed man, who, if he did not realise his ambition, had failed also in life. His love of society, and the curiosity that prompted him to see everything and to know everybody, did not make his heart less susceptible to the claims of friendship and humanity. He occasionally made enemies, but he never lost friends, and in spite of some irritating eccentricities, many of the best and most illustrious men of the day were glad to claim fellowship with him. And as Mr. Aubrey de Vere points out in a beautiful reminiscence of his "early and faithful friend," Richard Milnes was never known to desert a man in adversity. "His affections," he writes, "were much stronger than they were supposed to be, especially those connected with domestic ties, or with early recollections; he never forgot an old friend, and was always anxious to be of practical help to those who stood in need of aid, or who were unjustly assailed." And this judgment may be backed by that of the late W. E. Forster, one of the most estimable of modern statesmen, who said one day at his club, when Milnes had just left it, "I have many friends who would be kind to me in distress, but only one who would be equally kind to me in disgrace, and he has just left the room."

It is noteworthy that among all the severe things written of his friends by Carlyle, he has not, as his biographer points out, a word to say of Milnes that is not appreciative in its character. "Almost alone among the men of his generation, he seems to have inspired the great writer with a feeling of unmixed regard and friendship, and, accordingly, almost alone amongst them, he escapes that scathing satire which was at times poured forth so freely by Carlyle upon his contemporaries."

"He always puts you in a good humour," said Lord Tennyson to the biographer, and to him also the Laureate related how their friendship began. It was on the day on which he entered Trinity College as an undergraduate. "He saw a young man whose face struck him so much that he said to himself, 'That is a man I should like to know; he looks the best-tempered fellow I ever saw.' It was Milnes. They spoke to each other, and from that time forward they were friends."

Mr. Reid states that, in later years, a friend who chanced to sit beside Houghton in a company of which Tennyson was a member, heard the former say, pointing to the Poet Laureate, "A great deal of what he has done will live;" and then he added, half, as it were, to himself, "and some things that I have done should live too." There seemed, indeed, to be a pathetic yearning in Lord Houghton to leave a mark behind him in poetry, and here may be the place to relate an interesting anecdote with reference to the most popular of his songs. The incident occurred while on a visit to Ireland in 1836.

"It was years afterwards," his biographer states,

[1] This paper is due to the publication of the Life, Letters and Friendships of Richard Monckton Milnes, first Lord Houghton, by T. Wemyss Reid. 2 vols. Cassell and Co.

"that he told the present writer an interesting story in connection with this visit. He was driving, he said, to the house of his friends the O'Briens in one of the national cars, and as the horse's feet beat upon the road, they seemed to hammer out in his own head certain rhythmical ideas which quickly formed themselves into rhyme. By the time he had reached Cratloe the little poem was complete, and immediately on entering his own room he sat down and committed it to paper. It was the well-known song beginning, 'I wandered by the brookside,' and having the refrain,

> But the beating of my own heart
> Was all the sound I heard.

When he came down to dinner, he brought the verses with him, and showed them to his friends. They were unanimous in declaring them to be wholly unworthy of his powers and the reputation he already enjoyed, and they urged upon him the wisdom of committing them at once to the flames. As it happens, the little verses which thus met with so cold a reception when they were first launched upon the world, were destined to obtain perhaps a wider fame and popularity than anything else which fell from his pen." Mr. Reid adds that, a year after the song was published, a friend of Milnes', sailing down a river in the Southern States of North America, heard the slaves, as they hoed in the plantations, keeping time by singing a parody of the lines then universally familiar.

If the ruling ambition of Milnes from early youth to old age was the wish to gain a name in poetry, there was no jealousy in the feeling with which he witnessed the celebrity of greater poets than himself. While still young, he gloried in the splendid achievements of Lord Tennyson, just as in later life he witnessed with pleasure the success of others.

His friendships were never limited either by political or social considerations, and it is said that no object was dearer to him than the sharing of the blessings which he himself relished so keenly, with those who were less happily placed. "'Other people,' he once said to a neighbour at Fryston, 'like to give their friends bread; I like to give them cake.' And the whimsical saying was absolutely true!"

With the exception of Byron, Keats, and Shelley, who died in his boyhood, and of Scott, who died when Milnes was a very young man, he seems to have known all the poets of the century. For Wordsworth, the greatest of them all, he evinced his enthusiasm as an undergraduate at Cambridge, and the last speech he uttered, a month before his death, which the present writer had the pleasure of hearing, was in praise of the poet whom he had learned to love more than fifty years before. There is one story only of Wordsworth in "Lord Houghton's Life" that is worth recording. At seventy-five the venerable poet was invited to a masked ball at Buckingham Palace. Milnes expressed his intention of going to it in the character of Chaucer, on hearing which Wordsworth exclaimed, "If Monckton Milnes goes as Chaucer, the father of English poetry, all that is left for me is to go as Monckton Milnes."

Among the elder poets with whom Milnes was acquainted was Thomas Campbell, and it is interesting to read of the singer who had won much of his fame in the first year of the century, receiving from Milnes an introduction to Tennyson more than thirty years later. Another of his friends among poets who gained their reputation in his boyhood, or before he was born, was Savage Landor, who nursed him once in an illness with almost passionate tenderness, and talked of him one day at Rogers's breakfast-table, as the greatest poet then living in England. To Rogers, by the way, the biographer of Lord Houghton is not just. To say that he lived a life of self-indulgence is not to represent him fairly, for, in spite of much cynicism, his active and unostentatious benevolence is as remarkable, perhaps, as that exercised by Lord Houghton himself.

At the beginning of his London life, Milnes was a frequent guest at Rogers's famous breakfasts in St. James's Place, and there, in 1838, he met Macaulay, who had lately returned from India. Carlyle was also present, and the talk of two such men was anticipated with interest. But Macaulay, his mind overflowing with the stores of knowledge which had been accumulating during his sojourn in India, seized the first opening that presented itself, and having once obtained the ear of the company, never allowed it to escape, even for a moment, until the party was at an end. Greatly dissatisfied at the issue of a morning from which he had expected so much, Milnes followed Carlyle into the street. "I am so sorry," he said to the philosopher, "that Macaulay would talk so much, and prevent our hearing a single word from you." "What!" he said, with the accent of Annandale, "was that the Right Honourable Tom? I had no idea that it was the Right Honourable Tom. Ah, well! I understand the Right Honourable Tom now." The influence of Carlyle's genius was strongly felt by Milnes, who wrote that his works made on him "the impression of the sound of a single ratchet in the aboriginal forests of North America." He undertook the task of making Carlyle feel at home in the great world, and he was also his frequent companion in riding about London and its suburbs.

At Cambridge, Milnes had been a favourite pupil of Connop Thirlwall, the historian, afterwards Bishop of St. David's, and throughout life the two were fast friends. The sincerity also of the future Laureate's friendship may be seen from some delightful letters. Another close friend secured in the Cambridge days was Charles Buller, and "the two men were acknowledged as rival wits for many a year at the dinner-tables of the West-End." Those were days in which Sydney Smith poured out his fund of humour. He, too, was on the friendliest terms with Milnes, but he was an old man at this period, and, therefore, felt more at home at the breakfasts given by Rogers, than at those which Milnes gave in his chambers in Pall Mall. Sydney Smith was alive to his friend's eccentricities, and told him of them very plainly in a letter which, years afterwards, Lord Houghton read to his biographer with the greatest good humour. "Don't you think," he said, when he had finished the perusal, "that that was an admirable letter for an old man to write to a young one who had just played the fool?"

Among the famous ladies whose friendship Milnes was fortunate enough to win, were the Miss Berrys whom Horace Walpole had known and loved more than half a century before. Eccentric people, brilliant wits, poets, men of letters, and foreigners as well as Englishmen of distinction, were all welcomed within Monckton Milnes' expansive circle, and when, after his marriage, he took possession of Fryston Hall, that house received distinguished guests from every quarter of the globe.

"Never," writes Mr. Reid, "was there a more delightful host than Milnes. Whether his guests were famous or obscure, whether they belonged to the great world, or had merely for the moment emerged from the masses, they could not be long in his company without feeling the charm of his manner, and being warmed and attracted by the tenderness of his heart. His fame as a talker was world-wide, and there is no need to say that the dinner-table at Fryston was the scene of a hundred happy encounters of wit, intelligence, and knowledge. But to hear Milnes at his best, it was necessary to meet him at the breakfast-table. Although he spoke so often of his own indolence, and in spite of the fact that he was undeniably averse to physical exertion, he was always a very early riser, and when Fryston was filled with guests, he was generally astir hours before any of them had appeared on the scene. Perhaps it was due in some measure to this fact, that, when the house-party met at breakfast, no matter how distinguished for intellectual superiority might be some of those composing it, Milnes invariably showed a brightness and activity of mind which no one else could match."

Like Dr. Johnson, he dearly loved the clash of intellect and wit, and like Johnson, too, he infinitely preferred the pleasures of the town to the quieter enjoyments of a country life. Intercourse with his kind was dearer to him than that fellowship with Nature which Wordsworth found so satisfying. It is a pleasant characteristic of Milnes that, when he could not see the faces of his associates, he liked to have their portraits around him. Among his friends, a friend of whom any man might be proud, was Miss Florence Nightingale. He knew her long before she was known and reverenced by the world, and her name frequently occurs in his biography. A beautiful letter from her pen, written ten years ago to congratulate Lord Houghton on the marriage of his son, contains a passage which we are tempted to quote.

"There is something very inspiring in the faithful love, the early and the late, when two always say 'we.' I remember when I was a girl, Madame Hoche in Paris, widow of General Hoche, after the first year of marriage (far away be the omen!) to her dying day always said '*nous*.' She never called him to her own child '*ton père*.' I think one has known such instances of two in one through a long life together, God in both and both in one; but then the wife must help the husband in work, not prevent him. May such a life be given to our young pair; may all the true blessings be theirs, and may it be theirs to be a blessing to many in these, the most stirring times of this or any day! And after these are over may it be given them 'world beyond world to visit and to bless' together. Can one wish them more?"

Mr. Reid writes more than once of Lord Houghton as a patron. It is a word that carries with it unpleasant associations. We think of Johnson waiting in Lord Chesterfield's ante-room, of Chatterton craving help from Horace Walpole, of Gay cosseted like a spoilt child by the Duke and Duchess of Queensberry, and of Young craving patronage of the infamous Wharton. Poets too often disgraced themselves by truckling to patrons, and it cannot be said, generally, of the patronage given in former days to men of letters, that it blessed "him that gives and him that takes." There are exceptions to the rule, and nothing nobler can be told even of Edmund Burke than the way in which he befriended Crabbe, unless it be the account of the simple dignity with which the poet received that great man's favours. In generosity of spirit Lord Houghton may be said to have rivalled Burke. There is every indication that the help given by him to young poets and authors, was given for their sakes and not for his own aggrandisement. His sympathy with obscure men of genius was unobtrusive and persistent, and how patient he could be with their weaknesses may be seen in his gentle treatment of the young Scottish poet, David Gray. The poor fellow, whose eager life was soon to end, came to London to push his fortune, and wrote to Milnes, asking if he should bring a poem which he had promised to read.

"Looking two days before me," Gray writes, "I see starvation. Shall I send or bring it? I know that you do not want to be troubled with people of my sort coming about you; that is what makes me ask." Milnes responded instantly to Gray's appeal.

"He did not write," says Mr. Reid, "inviting him to send his manuscript to him—he did not even ask him to come to his house as a guest; but, within a couple of hours from the delivery of the touching note I have just printed, Milnes himself entered the humble lodging-house in the Borough, bearing with him a load of delicacies, such as he believed the writer of such a letter must absolutely need."

This was but the first of many acts of considerate kindness lavished by Milnes upon his fellow-poet—acts that demanded labour as well as money, and not a little patience also, for poor Gray, like Keats, combined with the excitability of genius the feverish irritation of a consumptive patient. Lord Houghton's aid was always given to rising men of genius in a wise way. What many of them chiefly needed was to be better known, and, as Lady Burton pithily expressed it, he "pulled them into notice." At the same time he "never encouraged a man who was seeking to abandon his own path in life in order to follow literature alone." Letters from aspirants of every class reached Fryston, and so many were the appeals for pecuniary help, that it is said he continued to the close of life to exercise a charity which was greatly in excess of his means. Mr. Reid, indeed, has amply proved the statement made by him at an early stage of the narrative, that Lord Houghton had "one of the kindest hearts that ever beat in human breast; a heart that, in the secrecy of its own chamber, knew no pleasure so great as that of alleviating the distress of others."

JOHN DENNIS.

# UNDER DISCUSSION

## LABOUR AND LEISURE.

"IS it not a curious thing," said Pleasance, "that so few people seem able to see the distinction that exists between different kinds of work?"

"Comparatively few people take trouble to think out distinctions or differences of any kind," I said. "But what or who has brought out their bewilderment on this particular subject?"

"The Vicar's sister, Miss Barwick," Pleasance answered. Pleasance had spent the previous evening with other friends; and she went on to tell me how the conversation there had turned on the subject of the recent strike and of the socialistic vision of a general working-day of eight hours. Miss Barwick, who was of the party, had silenced any discussion on the subject by asserting that it "must be all nonsense;" first of all, as it could not apply to domestic servants—and again, why should it apply to domestic servants, since it could not apply to their mistresses? Such propositions delivered in such sequence are a fair specimen of what puts an end to much of that interchange of ideas, which, if patiently and temperately carried out, might often unite two sides of a truth into one consistent and irresistible whole.

"Miss Barwick seemed quite unable to see," explained Pleasance, "that because the mistress of a house must be ready to hold herself at the service, in season and out of season, of those for whom her heart is responsible to God, it does not follow that she is entitled to make the same claim on her hired servant, simply as a servant. Nor yet could she see that, notwithstanding this difference, still the hired servant, merely as a woman—what Mr. Chadband might call "a human woman"—must recognise the claim of duties which could not fall on the factory hand or shop-girl as such. Miss Barwick waxed quite bitter, after the manner of some ladies, on the demand for "evenings out" and "holidays," saying that servants who insist on such things "nowadays," expect more freedom than mistresses can themselves enjoy, with any consideration for their husbands and children! She seemed quite to forget that servants require some respite from the work for which they are hired, precisely that they may have some opportunity for labours of love such as fill their mistresses' lives. Nor, on the other hand, did she seem to see that even if the labour of domestic servants was arranged to be done, as far as possible, within limits which should ensure leisure, they would not therefore be absolved from putting their shoulders to the household wheel as sister-women, fellow-Christians, and house-mates, in any domestic exigency which should arise."

"I think," she continued, rising and going to the bookcase, "that I can recall two pictures drawn by two poets which vividly set forth the widely different possibilities of these two conditions of life. The first is a grim etching from a London kitchen."

And turning over the leaves of a little book, Pleasance read—

"'I'm only a slave, sir, don't you mind,
Though I think I came of a decent race,
'Tis pleasant to hear you speak so kind
To a poor little girl with a dirty face.
The missus is lady-born, I hear,
And is proud of her dresses and tiny feet;
She gives me five pounds ten a year,
And when she is pleasant—her scraps of meat.

'I'm not so strong as I used to be
Though sixteen summers are all I've seen:
Four lodgers and one poor wench like me,
And missus—don't tell her—is awful mean.
If I was a lady I'd like to faint,
And lie on a couch or in easy chairs;
But I'm scrubbing for ever at filthy paint,
And dragging the scuttles up ninety stairs.

'It's quickly over, the time called night,
By six, I've got on my only gown,
By seven, I've three good fires alight,
The 'parlours' are early and off to town.
At eight, the drawing-room ladies ring
(I'd sooner wait on a score of men),
And when they are eating, I've time to sing
And a minute to rest at half past ten.'"

"Now, notice how the one softening of this bitter slavery enters along with a gleam of kindly human interest—

'There's a lady above—she's forced to teach—
Next door to the top floor back, who's wild,
And when he's tipsy, she hears him screech
And say what she never should hear, poor child.
I knew what she was from the scraps of lace
That peep from under her gown of gray:
For one of the smiles from that angel face
I'd run to her dozens of times a day.

'We haven't got winter the whole year round,
Sometimes in my kitchen I see the sun;
And it travels like gold on the dirty ground
Till it rests on the hearth where the beetles run.
I know that they think I can steal and pry;
I am waiting, so young, for a workhouse grave,
And I pray (but I haven't got time to cry),
For life is a lodging and I'm the slave.'"

"Well," I remarked, "so far from that being any exaggerated sketch, I can verify every detail, and add many more, from the life of a servant-of all-work in a London lodging-house, of which I once had some temporary experience. Her name was Sophy; she came from Lincolnshire," I went on dreamily, as memory gradually restored that dim episode of the past. "In height she was about four feet ten, with a plain, sensible, snub face. She had come up to town in the service of her mistress, the daughter of a professional man, but who had become an ill-used, unhappy wife, not without faults of her own, and finally driven to depend on her own resources. The girl had 'taken her side,' and stuck to her loyally. There were five flats in the house they occupied—kitchens, parlours, drawing-room floor, second floor, and attics. The mistress's own family consisted of an infirm and cantankerous mother, and a wilful, saucy little niece. She herself presently found an engrossing and lucrative employment, so the girl could get little or no help in the house. The 'family' lived in the front kitchen, where they also had a boarder, a young clerk, who slept in one of the attics. The 'parlours' were occupied by a young solicitor of early, exact, and exacting habits. In the drawing-rooms lodged a young barrister, son of a county family, and who always had a late dinner of three courses. Occasionally an aunt stayed with him, some apartment having to be promptly transformed into an impromptu spare room for her use. She had been engaged in philanthropic work in India, but she never had a smile on her face, rang her bell on every pretence, and, as Sophy said, 'was more trouble than all the rest put together.' In the second floor there was a struggling professional man and his wife, the latter very meddling and fussy. Their hours were rather uncertain, and they saw a great many visitors. One of the attics was occupied through the day by two young women, who assisted the mistress in her private occupation, and on these also Sophy gave attendance so far as they needed it. Her own bedroom was in 'the back-kitchen,' a tiny den just large enough to hold an iron bedstead and a chair, for Sophy washed herself in the sink, and 'did her hair' where she could. The place was so gloomy that it was the perpetual haunt of black-beetles, whom the light of fire and gas kept banished from the cheerier kitchen except at nightfall.

"Sophy did all the house-cleaning. She prepared, carried up, and cleared away all the meals—and there was always somebody's meal afoot! She lugged up all the coal-scuttles. She had a weekly 'washing,' generally without any assistance. She was seldom in bed before midnight; she always rose soon after five. She was let out every Sunday afternoon between early dinner and tea-time, and, if I remember rightly, she got a half-day 'off' once a month. I cannot recollect ever to have seen her sitting down or with a perfectly clean face, though she was never untidy. She often spoke in a sharp, peremptory manner, but I never heard her complain. She kept that place for three years, her wages rising in the last year to the rate of £12. She had 'begun' on £8. I think she was about twenty years of age. I was not so old or so experienced as I am now; therefore I made no attempts to discover Sophy's views on life in general. She was always honest and well-behaved, and I believe she could read. I never knew her to have any recreation. I was told once that on one Sunday afternoon she was caught in a shower, and that a young man brought her home under his umbrella! Her mistress said the work went on wheels all the next week. But nothing more came of it. Poor Sophy! I wonder where she is now. She must be quite a middle-aged woman—if she is not long ago worn out, and retired to rest in a chamber even narrower than the back kitchen!"

"Well," commented Pleasance, "I think your plain prose is more pathetic than my poetry. In many cases, of course, the mistress is not wholly or alone to blame. She is often the victim of circumstances beyond her own control—in the case of a lodging-house keeper, she perpetually feels the smart of the idleness, bad habits, and meanness of her lodgers. And any regulation which might put check on these would probably serve her quite as much as it would her servant. But now for the reverse of this dingy medal. I find it in 'Among the Hills,' a poem by the American Whittier. I will select only those verses necessary to set forth the vision of a life of strenuous labour glorified by

love and refinement. We are told how the travellers reach the 'white farm house' among 'the autumn-tinted maples':—

'On either side we saw the signs
Of fancy and of shrewdness,
Where taste had wound its arm of vines
Round Thrift's uncomely rudeness.

'The sun-browned farmer in his frock
Shook hands, and called to "Mary":
Bare-armed, as Juno might, she came,
White-aproned, from her dairy.

'Her air, her smile, her motions, told
Of womanly completeness:
A music as of household songs
Was in her voice of sweetness.

. . . . .

'An inborn grace that nothing lacked
Of culture or appliance;
The warmth of genial courtesy,
The calm of self-reliance.

'Before this queenly womanhood
How dared our hostess utter
The paltry errand of her need,
To buy her fresh-churned butter?

'She led the way with housewife pride,
Her goodly store disclosing,
Full tenderly the golden balls
With practised hand disposing.

. . . . .

'Our homes are cheerier for her sake,
Our door yards brighter blooming,
And all about the social air
Is sweeter for her coming.

. . . .

'And never tenderer hand than hers
Unknits the brow of ailing,
Her garments, to the sick man's ears,
Have music in their trailing.

'And when in pleasant harvest moons
The youthful huskers gather,
Or sleigh drives on the mountain ways
Defy the wintry weather—

'In sugar camps, when South and warm
The winds of March are blowing,
And sweetly from its thawing veins
The maple's blood is flowing—

'In summer, where some lilied pond
Its virgin zone is bearing,
Or where the ruddy autumn fire
Lights up the apple-paring.

. . . . .

'Her presence lends its warmth and health
To all who come before it,
If woman lost us Eden, such
As she alone restore it.

. . . . .

'And, musing on the tale I heard,
'Twere well, thought I, if often
To rugged farm-life came the gift
To harmonise and soften.

'If more and more we found the truth
Of fact and fancy plighted,
And culture's charm and labour's strength
In rural homes united.

'The simple life, the homely hearth,
With beauty's sphere surrounding,
And blessing toil where toil abounds
With graces more abounding.'"

"Ay," I said, "these two sketches clearly bring out what you mean—that there is a wide difference between such conditions, which difference sets the work which must be done merely to earn the means of existence, on quite another footing from those labours of love which can tolerate no limit but that of ability."

"Yes," answered Pleasance; "and further, that some conditions to regulate the former kind of work are the more necessary because the latter kind of labour always, more or less, underlies it. The sweater, the grinding taskmaster, the unfeeling Limited Liability Company, have their unfair advantage in that their victims are warm-blooded human beings with loving functions to fulfil. They can draw their chains tighter, and make their terms harder, because non-submission and non-compliance mean suffering and starvation to old fathers and mothers and helpless wives and children. I have sometimes thought that the great struggle in which the positions of capital and labour will be finally adjusted and settled can never be fairly entered into until working men are prepared to go into it, not only with studied fairness and patience on their own part, scrupulously avoiding the taking of undue advantage or any returning of evil for evil, but also in the spirit of those antique heroes whose patriotism spared

Nor limb, nor life, nor child, nor wife,
In the brave days of old.'

If a strike is really right and justifiable, then no suffering that results from it can condemn it. Is it not an established principle of moral philosophy that 'an action done from duty derives its moral worth, not from the purpose which is to be attained by it, but from the maxim by which it is determined'? And if women and children starve, and suffer even to death in the interests of right and justice, it will not be more than they now do at the behest, on the one hand, of greed and oppression, and on the other, of drunkenness and idleness. And to die in a good cause is, after all, about the best that life has got to give!"

Pleasance is rather an excitable and enthusiastic creature. She lifts me up into the tragedy and pathos of life, and my function is to restore her to the little levels of everyday trial and temptation!

"It ought not," said I, "to be difficult for anybody to see the difference between the simple womanly duties that may lightly rest on a maid-servant, whose substantial 'work' may have been

done in far less than the coveted 'eight hours,' and the grinding toil of that kind which lies so remote from human life that its commonest privileges can only be snatched by pecuniary sacrifice, like 'the walk which costs a meal,' of which Hood tells us in his 'Song of the Shirt.' There is so much work done in the world which need not be done, which indeed ought not to be done at all, yet which some people find themselves driven to do, because money is to be earned by it. And it is well indeed if any external help, be it of public opinion or legislative enactment, can save some part of such peoples' lives for proper human uses. I remember, when a girl, being vastly impressed by something I saw when I was being shown over a huge Highland distillery. We were led into a wide, low-pitched chamber, whose floor was covered with grain, which, in its process of fermentation, requires to be constantly turned over and kept in motion. An old man was at work doing this—doing it so diligently that he did not even pause during our visit. We were told that he had been occupied at this task for nearly fifty years, and for about twelve hours every working day. One could not help feeling that, if that man's life was to have any moral worth whatever, was to be aught but a mere mechanical curse to his kind, it must lie in some opportunity of his leisure hours, and wholly outside of his working day. A terrible doom!"

"And there are other occupations," said Pleasance, "which, though at least harmless, and even useful in their way, are so utterly unconnected with human nature and its development, that to be doomed to spend every waking hour in their exercise for the mere sake of animal existence is about the most damaging and dreadful form of slavery that could be invented. Such is the work of many tenders of machinery, of envelope-cutters, book-folders, matchbox-makers, and the like. But wherever human love and interest can enter into an employment itself, and not merely into the motive for doing it, then from the very nature of the case there need be no regulated remission of that labour, and indeed there can be none! It is this which underlies the old adage,

> 'Man's work is but from sun to sun,
> But woman's work is never done,'

an adage which was formulated in times when men were almost always the bread-winners, while women were given up to those duties, for which even sleep is readily forfeited, and for which leisure is joyfully waived—simply because leisure can have nothing better to offer! Perhaps this distinction between kinds of labour shows even more plainly, because it is more specialised, in the labours of genius, or of any strong innate talent or bias. For such there is no leisure. The eye of the painter, the observation and experience of the author, the heart of the philanthropist, can have no respite. They are for ever turning over, storing up, analysing or arranging. Years of unsparing training and ceaseless exercise culminate in some brilliant production or noble scheme, and the thoughtless public do not reflect what lies behind these, and will even grudgingly estimate how many pounds the artist can earn 'by a mere stroke of his brush,' or how much the author can make in a forenoon 'sitting leisurely at his comfortable desk.' The clerk, the shopman, and even the day-labourer may think half enviously of these things as they go home, their day's bread-winning done, to enjoy an evening's rest or social intercourse on which no thought of work need intrude. The artist, too, may have left his easel, and the writer his desk, but, like the famous ghost at the Scotch 'flitting,' the work of these departs with them! The unsolved problem of colour follows the painter into the bosom of his family; the incomplete train of thought will haunt the writer, the undeveloped destinies of the novelist's 'characters' may even withhold him from sleep, and keep him constantly at a nervous tension such as others do not feel save in the stress of two or three of life's great occasions. We know that the French writer, Honoré de Balzac, threw himself so intensely into his work, that his fictions were far more exciting and interesting to him than that social life which at best shows us little beyond its externals. 'Leave off talking of that nonsense,' said he to his sisters, 'and let us discuss my real people.'"

"One can imagine nothing more joyful than to find any life-work—any absolute daily duty—which is capable of absorbing us after this fashion," said I. "It seems to me about the best 'gift' that can be given to mortal. And yet I suppose it, too, has its tragic elements, in the public which 'cares for none of these things,' which throngs the levées of a little 'freak of nature' like Tom Thumb, while the masterpieces of the artist Haydon hang neglected; or in the careless criticism which praised the tender and sensitive sacred poet, James Montgomery, as 'vastly improved in style,' because it mistook for his the coarse word-painting of another! The records of genius are full of such mortifications. And a further tragic element of such work is its utter dependence on something entirely outside itself; on its tendency to incapacities with which none but the initiated can sympathise, because they do not appeal to the senses as do the maimed limbs or even the 'sick-headache' of other suspended labourers. Of course, I am not now speaking of any who will not make an effort to work unless they feel what they call the 'inspiration of genius.' Such, too often, do not know the meaning of inspiration or genius, nor that the best opportunity for these lies in the outlet given to them by patient application and endeavour. I am rather speaking of the sudden withdrawal of mental working power, sometimes without any known cause, sometimes under causes beyond means of removal. Every mental worker knows how his capacities are affected by mere 'atmosphere,' physical, moral, or spiritual. There are people whose very presence has a subtle power of checking any joyful mental movement. There are circumstances of mere petty worry and injustice which will cripple talents which have risen triumphant under the blows of sorrow and poverty. Such cessation of work is not rest but torture! Yet such sufferings and their almost impalpable causes often escape recognition, and can win neither

the sympathy nor help readily accorded to the injured workman or the sick clerk. Nay, often they must be concealed almost as if they were sinful, lest they earn those epithets of 'eccentricity' and 'peculiarity,' which the general world is so ready to hurl at those whose instincts are developed beyond its own. The French proverb has it, that 'in the country of blind men, a one-eyed man is a king.' But I think it holds equally true if we should say that, 'in the country of blind men, a one-eyed man is 'eccentric' !"

"I don't pity the mental workers—at least, not much," said Pleasance. "For I think it is their own fault that so many of them neglect what might be their greatest help—a fair share of manual labour. In the journals of Sir Walter Scott, it is remarkable how he dwells on the superior advantages which thoughtful women enjoy in the facility with which they can take up some merely mechanical handicraft, as an accompaniment to their mental operations. We have seen how subtle and active thinkers like Whately or Gladstone seek relief in the vigorous exercise of wood-chopping. And it has often seemed to me that those labours whose monotony, when perpetual, has a depressing and deadening effect on the unawakened average mind, might yet be used in moderation with the greatest benefit by those whose mental processes are only too active and eager! We have all heard how the restless nature of a great French authoress rejoiced in the soothing quiet of 'a long white seam.'"

"Yes," I responded, "and I have sometimes thought that the monotonous, coarse, or dirty tasks which the needs of society demand, might well be undertaken as duties by those above being degraded by them, rather than altogether relegated, as they now are, to those so ignorant and so low as not to realise the deprivations in which they live. For example, dirt does no harm to the man who hates it so much that he washes it off as soon as he can. It does immense harm to the other man who does not know what cleanliness is, and who never washes himself for fear he should take cold! Labour in heat and darkness does not in the deepest sense hurt him who appreciates sunshine and fresh air, longs for them while he lacks them, and returns to them as soon as he may. It does deadly damage to the man who knows nothing better, and who only leaves his mine or his foundry to take refuge in the varied gloom and brutality of some 'Coal Hole' public-house."

"Considering all the changes which have been wrought in social feeling during the last few years," said Pleasance, "I wonder whether we may not live to see the day when the charitable and refined will take their shift at the more noisome and dreary tasks of life, so as to release those who are generally held in their bondage? If such a thing could happen I think it would lead, not only to a good 'mutual understanding,' but doubtless to many ameliorations of the existing conditions of such tasks—ameliorations that may lie quite close at hand, and yet beyond the recognition of those who know of nothing better than things as they are. My grandmother used to say, 'Set a lady to do any work, and she will soon make it work for any lady.' It is possible that co-operation in some of their most trying labours might do more for the 'elevation' of the people than can any mere attempt to open up 'amusements' and 'recreations' for them. For amusements and recreation can be but the bye-play of any life, and if its main drama be deadening and degraded, that must degrade these along with it."

"Ah!" I remarked, "but there are some people whose lot it is to find weariest labour in those very occasions which make public holiday! Those kings and queens who have even the least desire to do their duty in that station of life into which it has pleased God to call them, do not have an idle life. But no one would pity them for the burden of State business or those great social functions which the sense of personal power and responsibility may well make magnificent and inspiring! What one is inclined to pity is that so much of their own well-earned leisure and of the time which their children and connections might devote to real work, is wasted in mere ceremonial, in bowings which an automaton might rival, in perfunctory surveys of public institutions, in hollow addresses and replies, and in all those conventional festivities which leave behind them such appropriate relics as silver trowels or golden hammers! One often wonders whether a little mercy might not be extended to them in these particulars. There might well be a Royal 'strike,' a princely movement to secure four months out of each year in which no such labours shall be asked nor expected! Like every movement which is good for anybody, I think that would be good for everybody. For it would check that snobbishness which thrusts aside local worth which it should be delighted to honour, in its servile determination to secure the presence of a 'personage.'"

"I don't suppose any walk in life can be free from its own grind and weariness," observed Pleasance. "Students cannot give themselves 'an eight hours' day,' and I have been told that in the management of their vast estates, many noblemen work as hard as busy solicitors. And rich men of every kind are always telling us that their wealth does not bring them peace and freedom from care, but rather a perpetual worry and unrest. Still we must remember that if these chose, they could free themselves from this thraldom by a careful simplification and diminution of their finances."

"At present," said I, after a pause, "it is mainly the hard and dirty work which is the worst paid, and therefore by which a man cannot live except by sacrificing his whole life to the mere means of existence. Is it not possible that a new order of things may come into play,—with rearrangements of payment and organisation by which such work will require to occupy but a small portion of any man's day? I fear we have all been but too thoughtless of the best interests of those who toil and moil among the foundations which uphold our boasted civilisation. Comparatively few of us have considered how much our comfort and daintiness involve others' sacrifice of these very things! It is so true—

'I cannot, sure, be warmed or lit
But men must crouch and toil in tortuous caves
Bowed on themselves, while day and night in waves
Of blackness wash away their sunless lives;
Or blasted and sore hit
Dark life to darker death the miner drives.'

But I wonder too whether the elevation,—the very redemption of labour, may not lie in this root of its perpetual sacrifice for others. Perhaps, while one half of society grows to see that grievous wrong is done where any man or body of men is kept in hard and heavy labour merely to secure the means of existence, the members of that suffering half may learn to regard even the lowest necessary work as apart from its mere wage-earning possibilities, and as their own honourable share in the service of the world. It has been pithily asked (many years ago), 'Is not vigilance as much the honourable duty of a railway servant as of a sentry?' Is not his post, of caring for the safety of his fellow-creatures, as good for the exercise of self-conquest and self-forgetfulness as that of any watchman on the castles of old? The dreadful accidents that must happen sometimes, and all the sorrow and misery they bring, should show us what the general dutifulness and efficiency of these people mean. . . Railway-guards and engine-drivers and such like, who are so careful and so patient with crowds of people going out for their business, health, or pleasure, may be doing God's work as well as missionaries and preachers."

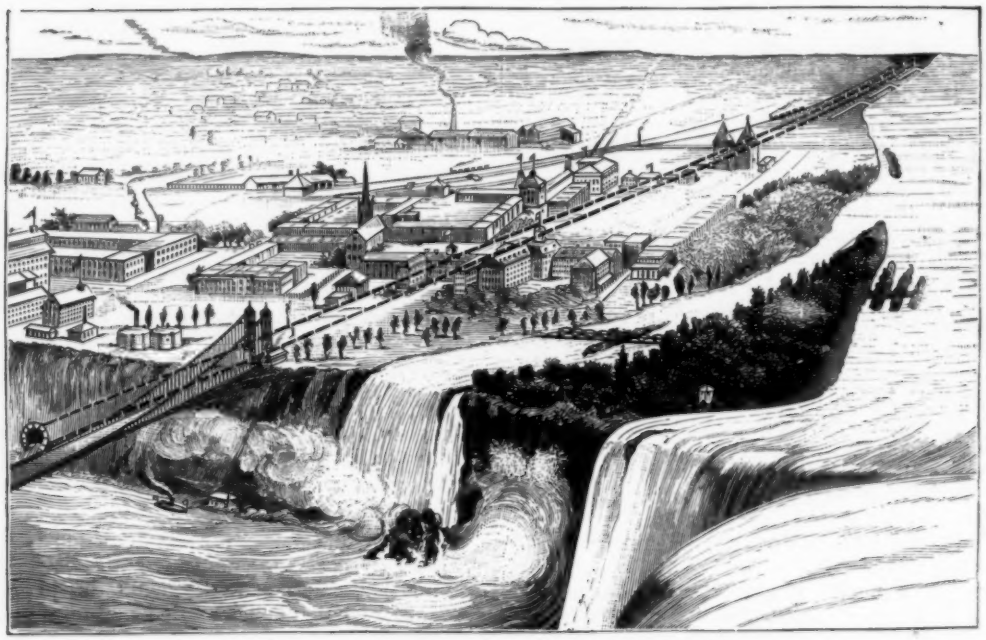
"Ay," assented Pleasance, "and a growing realisation on all sides, that the true value and dignity of life lies not in what we gain and get done for us, but in what we give and do for others, would soon lead to a public opinion which would make easy that mutual concession and understanding which are now so sorely needed. Perhaps we may look to the poets of the future to join with that sweet singer who hopes his

'Simple lays
Of homely toil may serve to show
The orchard bloom and tasselled maize
That skirt and gladden duty's ways,
The unsung beauty hid life's common things below.

'Haply from them, the toiler, bent
Above his forge or plough, may gain
A manlier spirit of content,
And feel that life is wisest spent
Where the strong working hand makes strong the working brain.

'The doom which to the guilty pair
Without the walls of Eden came,
Transforming sinless ease to care
And rugged toil, no more shall bear
The burden of old crime, or mark of primal shame.

'A blessing now—a curse no more;
Since He whose name we breathe with awe
The coarse mechanic vesture wore—
A poor man, toiling with the poor,
In labour, as in prayer, fulfilling the same law.'"



"In this spirit," I said, "every individual would play his own part in the salvation of society. But do not the fashions of to-day tend rather to society swamping the individual for its own presumed benefit?"

"Ah, that is the mischief of it!" cried Pleasance. "But we must not begin on that this evening."

# NOTES ON CURRENT SCIENCE, INVENTION, AND DISCOVERY.

## UTILISING THE MOTIVE POWER OF NIAGARA.

BIRD'S-EYE VIEW OF THE TOWN, SHOWING THE FALLS AND TUNNEL.

THE value of Niagara Falls as a source of power for the industrial purposes of modern civilisation has long been a subject of speculation. In days when the generation of mechanical power is achieved at increasingly tremendous cost to the coal supplies of the world, the absolute waste of natural forces which is to be seen at Niagara is more and more felt to be a scandal to the scientific world; and to-day no question is more familiar than that which asks why the great water-power of Niagara Falls is not harnessed to the machinery of extensive industrial establishments, and made to do work in some degree commensurate with its mighty potentiality. The very immensity of the torrent seems to call for unusual expressions in comparing the power with known or familiar units. The late Sir William Siemens is said to have stated, as the result of his calculations, that if all the daily output of coal in the world could be used in making steam to drive pumps, it would barely suffice to pump back the water flowing down Niagara River. The water-power to be disposed of is in fact so large that its very vastness has been given as one reason why its utilisation has been so comparatively slow. Something has been done, it is true, but it has been quite infinitesimal in comparison with the grand opportunity offered. A canal three quarters of a mile long, commencing just above the Falls and terminating on the high bank below, has for several years furnished the water to run about a dozen establishments, principally flouring mills, but so incomplete has been the provision for utilising the full head of the water that in the course of its escape in the tail-race, after passing through the wheels, it has in many cases a fall almost equal to that of the Falls proper.

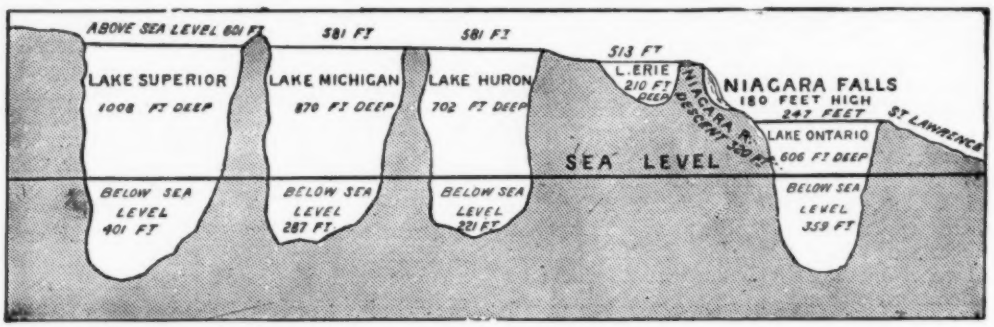
October 4, 1890, was accordingly a memorable day in the history of the Falls, which will no longer be left to dash themselves into useless spray, but will henceforth be employed in driving machinery without the use of coal or steam. On that day the tunnel from the upper river, under Niagara village, to the lower river was commenced.

Some months prior, a syndicate in the United States acquired a considerable area of land on the American side of the Niagara River at some distance above the great Falls. They propose to use it for mill sites, and to supply the mills with power by utilising a small fraction of the water-power which is available on the Falls. The actual fall of level at Niagara is about 200 feet. It is found that 4 per cent. of the total flow of water over the Falls would develop 120,000 horse-power; and the scheme is to divert this small part of the terrific current round the town of Niagara, and bring it out, by means of a tail-race, underground. A surface canal has been in operation for twenty years, but has only developed 6,000 horse-power, this limited success being due to the fact that the mills using the water from the surface canal do not use the

whole height of the bluff upon which they are situated, but have obtained such power as they have each required by heads varying from 100 feet to 50 feet, out of 200 feet available. But in the grand scheme now in hand it is proposed to take the larger body of water from the upper river, by a short lateral canal, to allow it to descend vertically in shafts in which turbines will be placed, and then to discharge it by a tunnel tail-race passing beneath the present town of Niagara at a point below the Falls. It is part of the plan to transmit a portion of the power to the important manufacturing town of Buffalo, eighteen miles distant.

Supposing the tunnel and its lateral canals to be successfully excavated, and the full value of so great a fall of water successfully controlled, there still remains the great problem of the transmission of the power thus acquired. Niagara itself is but a village, numbering some 5,000 inhabitants, and the comparative insignificance of the local industries, besides other considerations, points to a far wider sphere for the Cataract Company's operations. The formerly assumed necessity of setting up plant and works on the spot, is now not essential; for modern developments in the way of electrical and other sciences have been so great as vastly to enlarge the area of operations from a centre. It is accordingly in the distribution of this 120,000 horse-power that problems arise. Power can be distributed to great distances by wire ropes, as at the Falls of Schaffhausen; by water or air under-pressure, as in the compressed air system of Paris and Birmingham, and the Hydraulic-power Company's system in London; the British metropolis being supplied from central stations with the means of working lifts and moving machinery, from the heaviest kinds down to the humble sewing machine. In the city of Geneva, all kinds of trade and industry make use of the water-power of the Rhone, while the amount of force varies very much, the *minimum* being a third of a horse for sewing machines, and the *maximum* up to 625 horses for an electric light company. The great advantage of the system of transmission adopted is that the force can be transported to distant stations for use. But the extraordinary developments in the use of electricity in Switzerland and elsewhere, for the purpose of conveying the motive power produced by the glacier torrents, have impressed engineers with the belief that it is to electricity that they will owe most in their endeavours to utilise the Falls of Niagara. The choice of those methods which are most economical, and most likely to suit the wants of millowners, requires very careful consideration. Hence the Cataract Company have resolved to invite, from certain selected engineers and engineering firms, plans for the utilisation at Niagara of 120,000 horse-power, and to submit them for an authoritative opinion to the judgment of a scientific international commission. The commission consists of Sir William Thomson, F.R.S., as president; Professor Mascart, member of the Institute and Director of the Bureau Central Météorologique, Paris; Colonel Theodore Turrettini, who was director of the works for the utilisation of the motive power of the Rhone at Geneva; and, lastly, Dr. Coleman Sellers, formerly of the firm of Messrs. Sellers and Co. of Philadelphia, and now Professor of Engineering at the Stevens Institute, Hoboken, and at the Franklin Institute of Pennsylvania. Professor W. C. Unwin, F.R.S., M.Inst.C.E., is the secretary to the commission, whose headquarters are at the Central Institute in Exhibition Road, London, S.W. The first meeting was held in January.

It will at once be seen that some large assumptions are involved in the project. Not the least of these was the geological condition of the underground rocks, through which it is proposed to make a tunnel some 7,000 feet in length. So precarious and liable to fissure seemed the Niagara "shales" to one well-known American geologist, Professor Pohlman, as to lead him to estimate that a tunnel to the Niagara River below the Falls to transport the power to Buffalo would require the walling of sixteen miles of shale. The Cataract Company therefore caused three shafts to be sunk on different points of the proposed route to test the exact nature of the rocks. The result was very satisfactorily described by Dr. Coleman Sellers, in a report which gives us for the first time a really accurate and valuable account of rocks upon which so much has been written in relation to the age and rate of recession of the Falls. Dr. Sellers writes: "The pages of the book of the rocks in this locality have not been dog-eared or crumpled up as they have been in other places by great convulsions of Nature. Amongst the primary rocks the shales have been cooked, while in the secondary rocks at Niagara the slates and shales have been compacted by long pressure and not burned. If all known shales were as solid and compact as the so-called Niagara shales—which are really an argillaceous limestone—they would be dreaded by engineers. This rock, as placed by Nature at Niagara, is better unlined for tunnel purposes than any artificial lining of steel or masonry that man can devise, so uniformly equal is its firm texture. There will be no atmospheric disintegration of the surface of the rock—only the equable wear of running water, slightly deepening, century after century, the base of the tunnel."



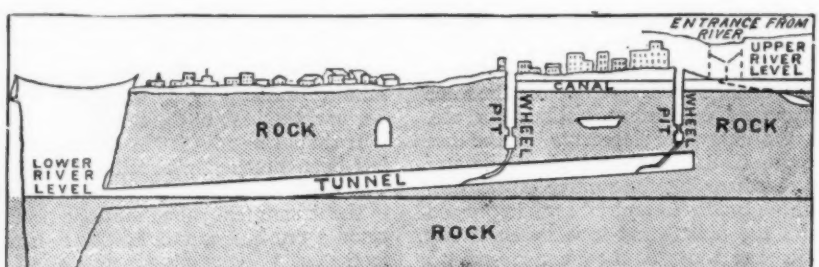
It should be added that the strength of the rock has been practically tested by Professor Unwin. The shale was crushed with a pressure of 690 tons to the square foot; the limestone overlying it withstood a crushing power of 880 tons to the square foot.

Accordingly the excavation of the tunnel was commenced, as already stated, on October 4, on the plans shown in the accompanying illustrations. It will be in horse-shoe shape at an average depth of about 160 feet below the ground, and some 400 feet from the river, with which it will be connected by surface canals. It will thus furnish an immense tail-race for the wheel-pits, to be sunk below the level of the canals. The tunnel canals and wheel-pits will all be cut in hard rock which occurs at no point over ten feet below the surface.

Another important assumption is the constancy of the water supply, as though no physical changes were to be apprehended in the outflow from the great lakes which feed the Niagara River. Our

illustration shows diagramatically the system of the great fresh-water lakes, or inland seas, which drain through the Niagara River and the St. Lawrence into the Atlantic Ocean, and extend half-way across the continent of North America.

The vast extent of these storage reservoirs, fed as they are by a rain area or water-basin of 241,235 square miles, "a territory double the area of Great Britain and Ireland," insures a uniformity of supply that is not to be found in any other stream in America, if in the world, that is capable of being



SECTION OF THE GREAT LAKES SUPPLYING NIAGARA FALLS.

used as a source of power. The volume of water in the lakes, including Lake Ontario, is about 6,000 cubic miles. Careful estimates show that it is sufficient, without additional rainfall, to continue the present flow of Niagara Falls for about 100 years, could it be gradually exhausted by drainage.

The result of this endeavour to "tame Niagara," and to utilise the immense natural forces which are at present running to waste, will be watched with eager interest. For although there is only one Niagara, there are all around us great and periodic forces of nature, such as the daily ocean tides, which are almost at our own doors, waiting to be harnessed, as it were, for industrial uses. An example has recently been described by an eminent English physicist; and others equally cogent might as easily be quoted. Speaking of the waste of tidal power in the river Severn, Professor Sylvanus Thompson says:—"The average rise and fall of the tide at the city of Bristol, five miles from its mouth, is 23 feet. According to calculations made from the average volume of water displaced up and down each tide, there are no fewer than twenty billion foot-pounds of energy wasted each year, or enough to charge ten million Faure cells. At the mouth of the river the total annual energy thus running to utter waste cannot be less than fifty billion foot-pounds. Thus in the rapid currents of the river Severn, with their enormous tides of great volume, the tidal energy must be practically unlimited. A tenth part of this energy in the gorge of the Avon would light the city of Bristol, a tenth part in the channel of the Severn would light every city; and another tenth part would turn every loom and spindle and axle in Great Britain."

What is done at Niagara will probably influence the plans adopted for the utilisation and distribution of power all over the world. And the selection of the best methods has fortunately proved to be a problem attractive to the very eminent scientific men who have consented to act in the matter.

COURSE OF THE TUNNEL FROM THE UPPER TO THE LOWER RIVER.

There is a strong tide of public opinion in America against any proposals for utilising Niagara in such a way as to disfigure the neighbourhood; and since the State of New York bought land at a high price close to the Falls, this feeling has become intensified. Fortunately the tunnel-scheme quite meets so praiseworthy a sentiment, leaving the natural beauties of the scene entirely unaffected.

[Our illustrations are taken from drawings issued by the Niagara Cataract Construction Company and the "Scientific American."—ED. L. H.]

## THE HEAT OF THE MOON AND STARS.

Instruments of precision, more especially for the purposes of minute measurement, have been refined to an almost incredible degree of efficiency during the last few years, and not least for the purposes of the astronomer, for "exploring the skies, sounding their depths, and dredging up their contents." A prime condition of the rapid advance of science is, in fact, the invention of suitable instruments of measurement. "Forces hardly suspected by one generation," wrote Professor Jevons, "are clearly recognised by the next, and precisely measured by the third generation. Accordingly the introduction of a new instrument often forms an epoch in the history of science." The astrolabe of Ptolemy, the telescope of Galileo, the pendulum of Galileo and Huyghens, the micrometer of Horrocks, Roemer's transit instrument, Newton and Halley's quadrant, Dollond's achromatic lenses, Harrison's chronometer, and Ramsden's dividing engine—such were some of the principal additions to astronomical apparatus which could be enumerated nearly a quarter of a century ago. Even then the astronomer could take note of quantities 300,000 or 400,000 times as small as could be measured in the time of the Chaldeans. To-day, within a decade of the twentieth century, we can safely put millions instead of the thousands mentioned. We can take note of the millionth of an inch in space and the millionth of a second in time. Even twenty-five years ago balances had certainly been constructed to show one part in a million, and Ramsden is said to have constructed a balance for the Royal Society to indicate one part in seven millions. This was thought to be hardly credible, but Professor Clerk Maxwell took it for granted that one part in five millions could be detected. Subsequent advances, especially in the measurement of radiant heat such as that of the moon and stars, are still more astonishing.

Attempts to measure the heat radiated by the moon are comparatively recent, and, so far as we know, entirely of modern origin. Melloni in 1846, at Naples, was the first to get undeniable heating effects from moonlight, but Tyndall got no result by the use of the thermopile. In 1856, Piazzi Smith made experiments at the Peak of Teneriffe with the thermomultiplier, a Price's candle at a distance of 15 feet being found to radiate just twice as much heat as the full moon. Still more exact and extensive was the series of observations made by the present Earl of Rosse, 1869–72. Lord Rosse was the first to discover that, during its long day of 300 hours, the moon does not store up heat; the instant the sun's rays are cut off, as in an eclipse, the heat declines, and no radiations are apparent in the most sensitive of terrestrial instruments. Professor Langley has shown that, in the absence of an atmosphere, the lunar surface, even under the fiercest sunshine, must remain frost-bound at somewhere below 50° Fahrenheit, and this result agrees with terrestrial conditions at great snow-covered altitudes.

Still more precise than the instruments employed by the Earl of Rosse and Professor Langley is the radio-micrometer of Professor C. Vernon Boys, of South Kensington. In this case, improvements in the suspending thread of the torsion balance have led to an almost incredible advance in the science of micro-measurement. In searching for a thread sufficiently fine and twistable, so that a metal disc suspended from it should yield to the slightest impact of radiant heat, Mr. Boys rejected successively, as being far too coarse, (1) fine wire about the thousandth of an inch in diameter, (2) spun glass, and (3) a single thread of the silkworm, or rather, one-half, after it had been split down the middle. All these were entirely superseded by the discovery of the value of quartz fibres—fibres spun from molten quartz. In his experiments on the heat of the moon and stars, Mr. Boys employs quartz threads only the fifteen-thousandth of an inch in diameter. So fine are these filaments that a hundred of them twisted together would produce a cable not thicker than the silkworm's thread. Indeed, the hundred-thousandth of an inch is by no means beyond the limit at which they are to be obtained, and so sensitive are they that they may safely be trusted to weigh the twenty-million-millionth part of a grain.

The following are some of the results which have been obtained from Professor Boys' radio-micrometer when applied for the measurement of radiant heat—viz., from a candle, a fire, the sun, the moon, the stars, or anything else which radiates heat through space. An appreciable effect is produced upon the radio-micrometer by a candle placed two miles away, at which distance its light is almost comparable to that of a barely visible nebula. This prepares us for the altogether new measurements obtained of the moon's heat. Not only is the total effect of the lunar rays enhanced by the radio-micrometer as compared with the results obtained by the Earl of Rosse, Professor Boys estimating them as 150,000 times greater than those of a candle 20 feet away; the local effects in various selected parts of the moon—the differential radiations from point to point—are also detected. This is an altogether new achievement in thermal researches upon the surface of our satellite. The difference of radiation between a moon nineteen days old, which goes through the sky with its dark edge foremost, and the nine-day moon, in which the bright edge goes forward, and the diminished heat at the terminator as compared with the luminous part of the disc, show in a wonderful way the discriminating power of the instrument. Professor Boys' experiments, with their larger results, fully confirm the inference drawn from the Earl of Rosse's observations—that the heat of the moon does not accumulate by penetrating beneath her surface: it lasts only from moment to moment as supplied by the sun.

Between the heat of the moon and the heat of the stars the gap is enormous. In the moon and the planets the eye is dealing with actual discs whose magnitude can be in some measure appreciated. But none of the stars have any perceptible dimensions. They are literally what Shelley calls them, "atoms of intensest light," globes shrunken by distance to the semblance of mere shining needle-points. It is true that the telescopic images of the stars appear to be of measurable size; but

this is so purely an optical effect that the "spurious discs" shown by them actually grow smaller instead of larger as the power of the instrument is increased.[1] Is it possible, then, to invent any instrument which should obtain any indication of heat from such mere needle-points of light? The question might have staggered even Newton himself, to whom must be ascribed the honour of leading the way in methods of minute measurement. But Professor Boys has answered it in the affirmative. In a lecture delivered a few weeks since in the London Institution, the Professor gave the first fruits of some of his experiments in measuring stellar heat rays. Beginning with the five superior stars in the northern hemisphere—Arcturus, Capella, Vega, Procyon, and Betelgeux—and proceeding in ratio to Aldebaran and Altair, a succession of definite heat values has already been established, and the work is still going on to stars of successively lower magnitudes.

Such are some of the successes in celestial measurements which have already marked the era of the radio-micrometer. In the language of an eminent astronomical writer of the present day, "the What next? is hardly asked when it is answered often in the least looked-for manner. In astronomical science the mind becomes so inured to novelties that antecedent improbability ceases to suggest dissent."

### THE MOTION OF STARS IN THE LINE OF SIGHT.

One of the newest and most notable of advances in astronomical science is the measurement of the velocity of a star which is travelling in the line of sight. For the latest account of the solution of the problem, science is indebted to the eminent American astronomer, Professor C. A. Young. Every one knows that the so-called "fixed stars" are not really fixed at all, but are moving very swiftly. So remote, however, are even the nearest of them, that it takes centuries to make their drift perceptible. But if a star happens to be moving "head on," so to speak—i.e. either directly towards us or from us—it will not change its apparent place in the sky, and its motion cannot be ascertained by any comparison of ancient observations with modern. But there is a way in which such a motion can not only be detected, but even measured with some degree of accuracy. The instrument used is the spectroscope, and the principle involved is that when the distance between us and a star is changing with any considerable rapidity, all the lines and markings in its spectrum are shifted in position as compared with the spectrum of a similar body at rest. The reason is that light consists of pulsations or waves, coming to us at regular intervals of time, and regularly spaced in distance, each coloured ray having its own place in the spectrum according to its wave-length or "pitch," so to speak. Now, if a star is coming nearer, then the waves due, say, to the hydrogen in the spectrum of its atmosphere, are encountered with greater frequency than if it were at rest, and so are virtually raised in pitch and shifted towards the violet end of the spectrum, where the waves are shortest, and *vice versâ*, of course, if the star is receding.

Dr. Huggins, the father of astronomical spectroscopy, was the first to make an actual observation of this kind in 1868. Very recently, however, the matter has assumed a new aspect through the work of Vogel in Germany, and Pickering in America. The former has applied photography with great success to a spectroscope of the ordinary form—i.e. with slit and collimator.

By the use of very sensitive plates and long exposures it is possible to photograph spectra that the eye cannot see at all, and Vogel has thus been able to secure negatives upon which, in favourable cases, a stellar velocity of a single mile a second produces a measurable shift of the lines. With this apparatus the "head on" motion of nearly sixty stars has already been determined at Potsdam with reasonable accuracy. Vogel's most interesting results are those relating to the stars Algol and Spica Virginis. The former[1] is a variable star, which acts as if it were partially eclipsed at regular intervals of 68·8 hours by a dark companion large enough to cut off nearly five-sixths of its light. Now the observations show that about seventeen hours before the greatest diminution of light, Algol is receding at the rate of 24·4 miles a second, while seventeen hours after, it is approaching with a speed of 28·6 miles. From this it follows that the "system" composed of the two stars is approaching us about 2·1 miles a second, while the bright star is moving in a nearly circular orbit around the common centre of gravity between it and its dusky acolyte with a velocity of 26·5 miles.

Other stars are under surveillance, and it is probable that our knowledge of the stellar motions will soon be greatly extended. It is already abundantly evident that the ordinary speed of these motions much exceeds anything that we find in the motions of the planets around the sun. It makes one almost dizzy to think of the swiftness with which the stars are flying. And the nebulæ are moving as swiftly as the stars.

# Varieties.

**Locusts in Australia.**—Much has been heard of the plague of rabbits in Australia, but the ravages of locusts are sometimes as disastrous. At one place in Victoria, about the beginning of December, the hot season in those regions, the arrival of an army of locusts from the north presented the appearance in the air, it is reported, "as of a snow-storm," and the ground was covered to the depth of three or four inches where they alighted. In Adelaide, the wind bore them to the sea, and the shore was lined with myriads that thus perished. In many places the vegetation was destroyed by the invaders. Caterpillars are also among the occasional plagues of Australia, one farmer being reported to have lost £600 through the loss of his barley crop. A writer in the "Sydney Morning Herald" says, he finds that planting lark-spur round a field greatly protects any crop, and tells how myriads of "grasshoppers" (locusts?) were thus poisoned. This is a statement which is important, if confirmed by further trials. Agriculture has its risks and its disasters all over the world, and those due to living enemies as well as atmospheric influences.

**The Belgian Succession.**—Our article on the King of the Belgians in the series of papers on "The Sovereigns of Europe" ("L. H." May 1890, p. 473) thus concluded:—"It is believed that in the event of his brother's demise, the Duke of Flanders would resign all pretension to the crown in favour of his eldest son, Prince Baudoin (or Baldwin). This young man, born in 1869, is highly popular among his future subjects. Carefully educated and trained, and not devoid of ability, his open physiognomy, his patriotic spirit, all contribute towards securing for him public favour." Alas! all these bright hopes have been destroyed by his early death, on January 22, 1891. It was the anniversary of the day when the King's only son, the Duke of Brabant, had died in the very year of his cousin's birth. The King and Queen had gone to visit the tomb of their son, and were suddenly recalled by the unexpected tidings of the dangerous condition of their nephew. The Salic law existing in Belgium, the prospect of perpetuating the Coburg succession in the direct line of the founder of the dynasty rests mainly on the second son of the Duke of Flanders, Prince Albert, now in his sixteenth year. Prince Leopold of Coburg, the widowed husband of our Princess Charlotte, was the first King of the Belgians, the trusted friend and counsellor of our Queen Victoria and the Prince Consort. Only second to the interest felt by the Belgian people in the future succession to the throne is that felt by Englishmen, who remember with honour and affection the reign of King Leopold the First.

**Working Classes in England.**—In the report of a tour in Europe by an American, published in a New York journal, he says: "The operatives in free-trade England have better wages and work less number of hours than do the workmen in Germany, Austria, and France, all of which are protected countries. Take for example the consular district of Manchester. In this district are 5,000,000 of people, and they are the best clothed and the happiest people I ever saw. They work shorter hours, have more holidays, undergo less deprivation, and suffer less distress than any other people. There is no community in America that can compare to this in the comfort and happiness of the working classes. All the laws of England tend toward the protection of the wage-earner, rather than of the capitalist, and the consequence is that the labouring people of England are the most satisfied in the world, and that in spite of an inherited aristocracy." This is a very different account of matters from what appears in the book of Mr. Carnegie on "Triumphant Democracy."

**Tea sold for £5 10s. per lb. in 1891.**—At the Tea-sale Rooms in Mincing Lane, a consignment of Ceylon tea was sold by auction on Jan. 13 at eighty-seven shillings a pound. The same tea was re-sold a few days afterwards at 110 shillings a pound, and is declared by experts to be the finest specimen ever seen in Europe. We do not give the names of the firms and companies, as the publicity has been already used for advertising purposes, but the fact of the high price, and of the interest caused in the trade, may cause increased attention to be paid by tea planters everywhere, as well as in Ceylon, to the quality as well as quantity of their tea. This specimen, of the appearance of golden grain, must have consisted only of the most delicate leaves.

**Hospitals and Asylums in Paris during the frost.**—The whole of the beds, about twenty-two thousand in number, in the Hospitals and Asylums of Paris were occupied during the severe season in the beginning of this year, and the Board of Public Assistance set up twelve hundred camp-beds in addition. The Hospitals were more crowded than at the worst time of the influenza epidemic in the previous year.

**Behring Sea troubles.**—The solution of the Behring Sea question comes home in a practical way to many workpeople. The bulk of the seal-skins find their way to London, where the fur-trade gives employment to some thousands of persons. The increasing scarcity of seal-skins in recent years has raised the price greatly. Naturalists ought to have a voice in the consultation as well as diplomatists. Flocks of merino sheep in Spain are not more worthy of protection as valuable property than herds of fur-seals in Alaska. English and American statesmen might well unite in protecting those seals which at certain seasons frequent the open sea. There ought at least to be an international "close season."

**Edinburgh University.**—The number of matriculated students in the session 1890-91 is about 3,500, of whom 1,979 are enrolled in the Faculty of Medicine, 468 in the Faculty of Law, 116 in Divinity, and the remainder, about 950, in the Faculty of Arts. Of the medical students, 814 are Scotch, 687 English and Welsh, 58 Irish, 99 from the East Indies, 270 from British Colonies, and 51 foreigners. The General Council of the University now numbers 6,622 members, and with the graduates of St. Andrews send a representative to Parliament. The amount annually bestowed in form of fellowships, scholarships, prizes, and bursaries, is about £14,000. Some of the bursaries are in the gift of private patrons, but the vast majority of the awards is awarded by the Senatus Academicus as the result of competitive examinations.

**Windfalls for Geneva.**—Since the city of Geneva came in for the property left by the Duke of Brunswick, a treasure of another sort has fallen to its lot. M. Fleuriot of Bulle, Canton Fribourg, bequeathed to M. Révillion, who died recently at Cairo, his collection of pictures and antiquarian relics. M. Révillion has left this collection of pictures, the finest in Switzerland, to the municipality of Geneva.

**Silent Worship.**—Mr. Stanley, in his description of the sublime scenery of Ruwenzori, the fabled Mountains of the Moon, rises to a tone of eloquence above the usual style of his narrative. "These brief views of superb Cloud King, as the Waconju fondly termed their mist-shrouded mountains, fill the gazer with a feeling as though a glimpse of celestial splendour had been obtained. While it lasted I have observed the rapt faces of whites and blacks set fixed and

uplifted in speechless wonder toward that upper region of cold brightness and perfect peace, so high above mortal reach, so holily tranquil and restful, of such immaculate and stainless purity, that thought and desire of expression were altogether too deep for utterance. What stranger contrast could there be than our own nether world, with its savagery and war alarms and stains of blood-red sin, to the lofty mountain king, clad in its pure white raiment of snow, surrounded by myriads of dark mountains, low as bending worshippers before the throne of a monarch on whose cold white face were inscribed 'Infinity and Everlasting.' These moments of supreme feeling are memorable for the utter abstraction of the mind from all that is sordid and ignoble, and its utter absorption in the presence of unreachable loftiness, indescribable majesty, and constraining it not only to reverentially admire, but to adore in silence the image of the Eternal."

**The Largest Farm in the World.**—This is a farm in the south-west of the State of Louisiana, measuring 100 miles north and south, and 25 miles east and west. The 1,500,000 acres of which it is made up were purchased seven years ago from the State of Louisiana and from the United States Government by a syndicate of northern capitalists, by which it is now farmed. At that time it was a vast grazing ground for the cattle of the few dealers in the neighbourhood, there being 30,000 head of cattle and horses upon it. This immense tract is now divided into convenient pasture stations, or ranches, the fencing alone having cost 50,000 dollars. The land is best adapted for rice, sugar, corn, and cotton. All the cultivating, ditching, &c., is done by steam power, a tract of about half a mile wide being taken, and an engine placed on each side. The engines are portable and work a cable attached to four ploughs, the area ploughed in this way, with the labour of only three men, being thirty acres. Harrowing, sowing, &c., is done in the same way, and there is not a single draught horse on the estate. Horses are, however, used by the herdsmen, who look after the 16,000 head of cattle upon the estate, which is traversed for thirty-six miles by the Southern Pacific Railway. The company has three steamboats upon the 300 miles of navigable waters which traverse their estate, and also possesses a ship-yard, a bank, and rice mills.

**Dowager Lady de Ros.**—About the close of the year a notice appeared of the death of Lady de Ros, which turned out to be unfounded. She was said to be still in good health, and in her intellect and memory clear as ever. Of the one great historical event with which her name is associated, the ball at Brussels on the eve of the battle of Waterloo, she has the most vivid recollection, and she took part in the recent discussion as to the true scene of the ball, which was not in the place which Byron had made famous by his poetry. Lady de Ros was born September 30, 1795, the third daughter of Charles, fourth Duke of Richmond, general in the British Army. Two of her sisters are still living, Lady Louisa Tighe, who was eighty-seven on October 2, 1890, and Lady Sophia Cecil, widow of Lord Thomas Cecil, who is in her eighty-second year. Lady de Ros always makes Waterloo day a great occasion. Last year she called in person on the Earl of Albemarle, who fought at Waterloo, and is now in his ninety-second year. She gave him a laurel leaf, which he wore at the opening of the Military Tournament that June 18. There is a Waterloo veteran still older, General Whichcote, who is in his ninety-seventh year.

**Racial Problems in the United States.**—In the Southern States the difficulty is ever increasing as to the future of the black and white population, between whom the gap extends year by year. Almost the whole of the labour is carried on by negro or coloured people, the whites being either "bosses" or "loafers." The "mean whites" will do no work bringing them to the level, as they say, of the inferior race. Although the black race is despised by the white, the whole region could better spare the white than the black people: without the negro, or some substitute for him, the mean whites would starve. The question is even mooted whether certain States in the south might not be given entirely over to the coloured people, and the "mean whites" forced to migrate to the North-Western States where they might usefully exist as farm labourers. Another more desperate solution is advocated by the writer of a series of articles in "The Times" on "The Negro Question." He proposes the return of the whole negro race to their own "dark continent," and this by wholesale deportation at whatever cost. The largest sum possible for expenses of compensation and transfer would be small compared with the cost of another civil war, which is inevitable, if nothing of the heroic kind is done before the blacks become too numerous and strong. Mr. Stanley says that "there is space enough in one section of the Upper Congo basin to locate double the number of all the negroes of the United States without disturbing a single tribe of the Aborigines." This region possesses 224,000,000 acres of land, and every negro, if there were 7,000,000 of them, might own nearly a quarter square mile of land. Five acres planted with bananas would afford food and wine, and twenty-seven be left for other cultivations, for trade and export. Mulattoes must be disposed of elsewhere.

**Mortuary Gold.**—In reference to the burying of gold with the dead, as described in the "Leisure Hour" Varieties for January (p. 211), a correspondent at Southport, W. C. C., quotes a law of the xii. Tables in ancient Rome (x. 9), passed B.C. 449, forbidding gold being buried with the dead, except such as the teeth were fastened with. There were skilled dentists, then, in early times at Rome; the law probably was against the burying of gold ornaments with the dead. A correspondent at Bromyard, J. K. D., mentions two passages from Cicero, quoted from a note in J. A. St. John's edition of Sir Thomas Browne's "Hydriotaphia," or treatise on Urn-burial.

**Protection of Workmen in France.**—A law has been passed relating to employers and employed, protecting workpeople from being hastily or arbitrarily dismissed, and at the same time requiring workmen to give as long notice to employers as is required in employers wanting to dismiss them. The law is approved by the chief Radical and Socialist leaders and journals. Workmen in France ought to have some legal claim for compensation in accidents due to insufficient protection in their work, as is now their right in England, but with greater strictness in preventing them contracting themselves out of the legal conditions of compensation.

**A Sensible Conclusion.**—Sir Wilfrid Lawson, in declining to interfere in the dispute between the railway men and the Companies in Scotland during the strike, said: "In my humble opinion we shall never get rid of these heart-rending strikes, until employers and employed hit upon some workable system of profit-sharing."

**Short-sighted Soldiers.**—In the notable speech on educational reform, delivered at the Educational Conference at Berlin, the Emperor said that when he studied at Cassel no fewer than eighteen out of a class of twenty-one wore spectacles, while two of the eighteen could not see to the end of the table even when wearing their glasses. He was told that in the upper forms of high schools the percentage of short-sighted pupils was sometimes as high as 74 per cent.! It was plain from this that there was too much study begun too early in life, and carried on in badly ventilated rooms. Less brainwork and more physical exercise in early life must be the rule if the empire was to have efficient State servants as well as good soldiers. "As Landesvater, or father of my country," said the Emperor, "I declare that such a state of things must cease."

**Incubators, or Egg-hatching Machines.**—In a shop on the west side of Regent Street, near Oxford Street, hatching machines are on exhibition, and the movements of the young chickens are always watched with curiosity by crowds at the shop window. The use of incubators is widely spreading in this country, both for game and for domestic poultry. The United States Consul-General in Egypt, in a report recently published, describes the system of hatching eggs by artificial heat pursued in that country from time immemorial, and still in active operation. One establishment visited by the Consul-General was wholly constructed of sun-dried bricks, mortar, and earth. It was 70 ft. long, 60 ft. wide, and 16 ft. high, and was provided with twelve compartments or incubators,

each capable of hatching 7,500 eggs, or altogether 90,000 at one time. The season begins in March and lasts until May, and three batches of eggs are hatched in this time, each taking an average of three weeks. The fourth week is given to removing the chickens and preparing the incubators for a new batch of eggs. The number of eggs treated at this establishment in a single season was therefore 270,000, from which 234,000 chickens are usually obtained. The percentage of chickens would be greater, but that the eggs are in some instances procured from long distances and in large quantities, and are therefore liable to damage. The price of eggs is 2½*d.* per dozen, and chickens just issued from the shell are sold at 7½*d.* per dozen. The loss of chickens after incubation is comparatively small. The whole staff of the place is a man and a boy, who keep up the fires to a temperature of not less than 98° F., arrange the eggs, move them four or five times in the twenty-four hours, look after the chickens, and hand them over to the buyers. The number of chickens hatched in this manner throughout Egypt is estimated at 75,000,000, and would, under ordinary circumstances, require 1,500,000 mothers.

**Forged Paintings.**—It is estimated that at least three-fourths of the paintings sold as pictures of the "old masters" are modern forgeries, and not even "old copies of the originals." M. Courbet, the Parisian artist, who made himself notorious by attempting to destroy the Napoleon column in the Place Vendôme, was one of the chief criminals in regard to these forgeries. Having taken refuge in Geneva he there established a manufactory for turning out classical pictures by famous masters. By skilful manipulation the appearance of antiquity was given to the modern works. In the "Architect" a correspondent recently communicated some strange information about Courbet's workshops. After his death his establishment was broken up, but several artists employed by him have continued the business. The demand for pictures is so great from American as well as European wealthy purchasers, that it is to be feared that picture-dealers not unfrequently connive at the frauds. In fact it is not safe to buy any reputed paintings by old masters, without an authentic and genuine history, capable of full verification. Long before Courbet's time this nefarious trade was often exposed, and it was from his strong exposures of it that the late Mr. S. C. Hall, of the "Art Journal," did good service in gaining higher prices for modern pictures by known painters.

**British Birds.**—The "History of British Birds," by the Rev. F. O. Morris, has been for more than thirty years a standard work, well known to professed ornithologists, and a favourite book of reading and reference among lovers of nature. We are glad to see a third edition, containing, along with other additional matter, figures and descriptions of about thirty species of birds new to our islands since the first issue of the book in 1857. Apart from the scientific matter, there is in all that Mr. Morris writes the charm of literary association, and a tone of devout piety, such as has been almost universal in writers on natural history since the days when Ray wrote his "Wisdom of God in Creation." Nunburnholme, the Yorkshire parish of Mr. Morris, has been called "the Selborne of the North," the venerable writer also in his quiet enthusiasm and watchful observation reminding us of Gilbert White.

**Lord Derby on Emigration and Colonization.**—In an address on social questions at the annual meeting of the Liverpool Home for orphans and destitute children, Lord Derby spoke of the serious problems to be faced when there are every year 400,000 more human beings in this country to be fed and employed. We must, for public safety, be an emigrating country. As for colonization on a larger scale, it has never succeeded yet, and probably never will. Every opinion of Lord Derby is worthy of attention, but he cannot, in thus speaking of colonization, have remembered the colonies of ancient Rome, by which the same problem of over-population in a small territory was successfully solved.

**Dormitories for the Poor.**—Forty years ago a distinguished architect, Sidney Smirke, proposed that there should be public dormitories in suitable parts of London, where the poor and the labouring classes could obtain cheap and healthy lodging. The rooms would resemble, he said, the wards of Chelsea Hospital, and divided into compartments. Each building might contain 84 beds or compartments, and, if let at twopence a night, the annual rent of £252 would be obtained, if the building cost £2,400, or ten and a half per cent. on the outlay of capital. At that time, Mr. Smirke said, it was common for sixty people to sleep in loathsome dwellings, with six or eight rooms, each having at least six beds, and the charge was 4*d.* or 6*d.* a night. Matters are only a little better now, under the Common Lodging House Act. In the plans for better housing of the poor of London, the proposals of Mr. Smirke are still worthy of attention. There are casual wards, it is true, or workhouses, but those who use them are absolute paupers, not poor people under temporary straits.

**Assyriology.**—Professor Sayce is contributing to the "Sunday at Home" a series of articles on "Social life among the Assyrians and Babylonians," as revealed in the sculptured memorials in the decipherment of which he is a master. A paper on some recent discoveries was lately read at the Victoria Institute by Mr. T. G. Pinches, of the British Museum. He gave a reading from an inscribed tablet, of the probable age of 2500 B.C. From this and other records he concluded that the Babylonians were more warlike than the Assyrians, who were more commercial in their occupations. The Assyrians, it seems, were very litigious, and many of the inscriptions are carefully prepared contracts. Mr. Pinches showed that money was lent at the rate of 20 per cent. by one usurious Assyrian. The general tenor of these records attests the ancient character of the Old Testament Scriptures, as opposed to the assertions of some critics as to their being of the ages after the Captivity, though possibly some portions were re-edited in the time of Ezra the scribe.

**Letter of Louis Philippe, King of the French.**—Connected with the Royal Literary Fund, and now under the same management, is a fund for relief of poor and distressed schoolmasters. In the records of the Society is a letter from the French King, written when he was Duc d'Orléans. He had been applied to by Dr. Kelly, the secretary of the Fund, to send a donation, and thus replied: "The Duke of Orleans presents his compliments to Dr. Kelly, and is very sorry that his note has remained so long unanswered. It was his intention to have expressed sooner how much he was flattered by Dr. Kelly's very obliging intimation of the motives for which the Duke of Orleans ought to feel a particular interest for the schoolmasters. The Duke of Orleans has in fact more motives for being attached to that useful and respectable class of men than he believes Dr. Kelly can be aware of; since it is not probable he should know that among the many vicissitudes of fortune which fell to the lot of the Duke of Orleans is to be found that of having been a schoolmaster. It is, however, a matter of fact that, at a time of severe distress and persecution, the Duke of Orleans had the good luck of being admitted as a teacher in a college, where he gave lessons regularly during a space of eight months. The Duke of Orleans hopes, therefore, that the Society for the Relief of Distressed Schoolmasters will permit him to render his mite as a fellow schoolmaster." (Dated Twickenham, December 10, 1816.)

**Foreigners relieved by the Royal Literary Fund.**—The mention of the Duke of Orleans reminds us of another case of a distinguished Frenchman, in his adversity assisted by, and in his prosperity a benefactor to, the Royal Literary Fund—the eminent author and statesman Chateaubriand. At the annual dinner of the society, in the year when the Duke of York presided, in 1822, Chateaubriand made an eloquent and most interesting speech. He told the story of a French emigrant, in deepest poverty in London, and suffering great distress on account of a debt of small amount. A friend made known the circumstances to the council of the Literary Fund; we believe it was M. Peltier, the emigrant who was prosecuted by the Emperor Napoleon in the English Law Courts. The grant bestowed by the Fund saved the Frenchman from distress and ruin. At the Restoration, he returned to his native country, and, being employed by the Government, rose from office to office, till he returned to England as Ambassador for France. "Gentlemen," concluded Chateaubriand, "I am that man!"

**Queen's College, Oxford, and the Archbishop of York.**—The same paper which announced the decease of Dr. Thomson, Archbishop of York, contained the report of the ancient Christmas custom of serving the Boar's Head at Queen's College, Oxford, of which the Archbishop was formerly Provost. A massive head weighing 70 lb. had been prepared by the college manciple, and this was carried, on a massive silver dish and "bedecked with bays and rosemary," upon the shoulders of four serving men, the choristers, under the direction of Dr. Plumridge, singing the boar's head carol. Another ancient custom at Queen's is the call to dinner daily by sound of trumpet or horn, and not by bell or gong. The name of Thomson will always be remembered with pride among distinguished Queensmen.

**Carrier Pigeons and National Defence.**—A Paris newspaper states that German carrier pigeons are constantly being sent to Amiens, viâ Belgium, notwithstanding official prohibition. M. Lutigneau, the police commissary of the Amiens railway station, made the discovery by being present at the release of some birds. For some time he had noticed that when pigeons from certain fanciers in Belgium were released, some of them took the direction of Germany, while the others flew towards Belgium. His suspicions have, it is said, now been confirmed by certain marks on the birds which prove that they come from Germany. The French Government is, therefore, urged to take measures to prevent the continuance of a fraud which, it is declared, is of a nature to impair the national defence.

**Gas and Fog in London.**—On that foggiest of foggy days, the Monday before Christmas Day, 1890, the Gas Light and Coke Company delivered one hundred and twenty-six million cubic feet of gas. This, which is the company's maximum for one day's supply, was ten million cubic feet more than they supplied on the corresponding day of 1889.

**Anti-slavery Society.**—Mr. Charles Allen, Secretary of the British and Foreign Anti-slavery Society, whose presence, with that of other delegates, was constant at the Brussels Conference, appeals for aid to the funds of this old and well-tried institute. Without professing entire agreement with every one of the hundred articles in the General Act of the Conference, the Anti-slavery Society will watch over and help to enforce the general provisions of this important Act, to which the late, but sufficient adherence of Holland has given unanimity in the resolution of all civilised countries to abate the evils of slavery throughout the world, as well as in Africa.

**Babylonian Antiquities in the City of London.**—In a paper read before the Society of Biblical Archæology, by Mr. B. T. Evarts, attention was called to the discovery of curious relics during the demolition of some old houses in Knightrider Street. The workmen came upon some fragments of black stone, bearing inscriptions in a strange language. The three stones have been acquired by the British Museum, and prove to be Chaldean monuments belonging to the earliest period of which we have any knowledge, namely to the pre-Semitic age of Ur-Nina and Gudea, when the Accadian language was alone in use, and the characters were of the most primitive kind. It is impossible in a brief note to give any description of these stones, or to discuss the inscriptions thereon, or to conjecture how they found their way to London. Probably they were consigned to a London merchant in the Levant trade, to be kept in his collection of curiosities.

**Jubilee Shillings.**—Statements have appeared in the newspapers to the effect that the shilling pieces without any space between the representation of the head of her Majesty the Queen and the rim of the coin were spurious, and had been manufactured in Germany, and were only of the value of 7½*d*. The Chancellor of the Exchequer, on being appealed to, said that such statements were wholly unfounded and erroneous. He stated that in 1889 a slight change was made in what is known as the Jubilee shilling, the head of her Majesty being slightly enlarged. There is less space, therefore, on this coin between the head of her Majesty and the rim than there was on the original Jubilee shilling.

**Champagne Trade.**—According to the official return, 19,148,400 bottles of champagne were exported from France in the year 1889-90 (April 1, 1889, to March 31, 1890). During the same period 4,176,000 bottles were consumed in France.

**Saint-Porchaire Henri Deux Pottery.**—This curious and antique ware, known only to few collectors, was made in Poitou, at Saint-Porchaire, a little town where a manufacture of faience existed up to the 18th century, and where, at the present day, there still remain three manufactories of coarse pottery. The Duc de la Trémoille's manuscripts, one of them dated 1542 and the other 1577, mention, as being in possession of the family at that time, two cups and two salt-cellars *de terre de Sainct Porchayre;* and a remarkable aid to the identification of this precious pottery is to be found in an English collection—that of Mr. Charles Magniac, which contains a cup bearing the Trémoille arms, a cup of the famous Henri Deux ware.

**Transatlantic Cattle Trade.**—Mr. Plimsoll, with his wonted zeal and kindliness of intention, has commenced an agitation on the alleged cruelties of the "middle passage" of live cattle from America to England. He even goes so far as to advocate the prohibition of any importation of live stock. His statements may induce inquiry, but it is evident that he is greatly exaggerating the evils referred to. A letter from a large firm of shipowners gives statistics showing that last season not above one in a thousand of the cattle carried by their ships was lost or injured; a mortality as small as if they were grazing in fields. It is also stated that cattle do not suffer from sea-sickness, contentedly chewing the cud and heartily feeding all the voyage. Of course the deck passage is uncomfortable, and even perilous, both to man and beast, in rough weather.

**Books Published in 1890.**—According to the "Publisher's Circular," the number of new books published in the course of the year 1890 was 4,414, and of new editions 1,321, making a total of 5,735. This does not reach the number recorded in 1889, when 4,694 new books and 1,373 new editions, or a total of 6,067 works, were published. The 4,414 new books that were produced in the year just closed may be divided into 14 classes, and the numbers under the several heads are as follows:—Novels, tales, and other works of fiction, 831; educational, classical, and philological, 615; theology, sermons, &c., 555; juvenile works and tales, 443; year-books and serials in volumes, 318; history, biography, &c., 294; voyages, travels, and geographical research, 188; belles-lettres, essays, monographs, &c., 171; medicine, surgery, &c., 143; poetry and the drama, 114; political and social economy, trade, and commerce, 87; arts, sciences, and illustrated works, 54; law, jurisprudence, &c., 40; and miscellaneous, including pamphlets, 511.

**Frost and Salad.**—A curious result of the long-continued and severe winter is reported from Paris. To the Frenchman a salad, of all vegetable food, is a necessity of diet. In January the price of the most ordinary materials for salad rose from about twopence to above tenpence a pound. For more special plants, such as dandelion and doucette lettuce, the charge was three francs for a small portion. In the *Halles Centrales* cabbage heads unfrozen cost a franc instead of two sous; parsley was charged two francs a pound; and other vegetables were dear in proportion. The prices of salads were almost prohibitory to the poor, and the rich paid as much as during "the Siege!"

**Immigration into the United States.**—Official returns show that, as nearly as can be ascertained, 15,546,757 immigrants have arrived in the United States in the century between the foundation of the Government in 1789 and the end of the fiscal year 1889-90 (June 30 last). It is estimated that 250,000 entered prior to 1820. From 1820 to 1855 inclusive the alien passengers arriving numbered 4,212,624, of whom 98 per cent., or 4,128,372, are supposed to have been immigrants. Records have been kept of immigrants apart from other passengers since 1856, and the reported total from that year to June 30, 1890, is 11,168 385. Of late years,

however, no count has been made of immigrants from British North America and Mexico, and as many more than were formerly reported came in through or from Canada, the aggregate for the century doubtless has been a good deal in excess of the 15,546,757 given by official statistics. The years of heaviest immigration were those from 1880 to 1884, and the heaviest single year was 1881, when 669,431 immigrants entered. Practically, the whole of the immigration is from Europe, the European arrivals last year being 443,225, out of a total of 455,302. Germany has for the last ten years sent to the United States annually many more emigrants than any other country, although the United Kingdom, taken as a whole, has a decided lead. In the fiscal year 1889-90, 122,754 persons went from Great Britain and Ireland, 92,427 from Germany, 56,199 from Austria, 51,799 from Italy, 33,147 from Russia, and 29,632 from Sweden.

**Roman Catholic Census of British North America.**—The Rev. Abbé Baillargé, of Joliette, has collected statistics showing the Roman Catholic strength in Canada to be as follows:—One cardinal, five archbishops, 22 bishops, 2,352 priests; 43 male religious orders with 250 members, and 66 female orders with a membership of 964; 1,914 churches and chapels, and 317 missions; 17 seminaries, 3 universities, 53 colleges, 333 convents, 166 academies, and 3,203 schools; 69 hospitals, and 48 asylums. These represent a Roman Catholic population of 2,048,000, in 1,157 parishes. In Newfoundland the Abbé states that there are two bishops, 58 priests, 77 nuns, 137 churches and chapels, 7 seminaries, 1 university, 15 convents, and 130 schools, with 79,000 Roman Catholics in 41 parishes. We should like to know the proportion of French and Irish in this Canadian census, and that of other nationalities as well as native-born subjects of the Dominion.

# Household Queries.

**Washing Sponges.**—*Would you inform me the best mode to wash sponges without injury, and to retain their colour?*—Sponges cannot be kept clean unless always rung out of *clean* water as dry as possible after use, and exposed to the air till dry. The proper mode of cleansing is to let them lie in strong borax and water, or soda and water, for some hours, squeezing them as hard as possible occasionally. If necessary, they may then be laid for some hours more in muriatic acid and water strong enough to taste exceedingly sour, and afterwards rinsed. Generally, however, the soda will suffice. The bright yellow of many new sponges is really a stain, and cannot be preserved permanently. Another way that sometimes answers very well, is to soak in cold butter-milk for some hours, afterwards well washing in plain water.

**Whitewash.**—*Will you please tell W. how to make and apply a good whitewash that will not rub off?*—Plain whiting will do very well, working down all lumps. To prevent its coming off, size is mixed in the water. About half a pound of dry glue soaked in cold water till soft, and then gently melted, would probably be about the quantity for twelve pounds of whiting, which would be enough for a large room or outbuilding. If the wash is sticky, there is too much size; if it comes off, too little. It is used nearly cold. For room work a better preparation is that well known everywhere as Morse's Calcarium, which can be had in any colour, and approaches distemper in effect. There is another very similar in the market known as Alabastine. Full directions accompany both of these.

**Whole-meal Bread.**—*Kindly tell me how to make whole-meal bread?*—The general method of making in no way differs, but as it is naturally rather more heavy, only those who are successful bread-makers with white flour can expect a good result. It requires on the average a little more yeast, rather more kneading, and always longer and rather slower baking, or the crust is like adamant. On an average three quarts of meal would require about a gill each of yeast and molasses, and about a quart of warm water; but different meals absorb rather differently. The method of making is precisely the same. Some people put in a very little potash.

**Cork Ornaments.**—The recent mention by a contributor of scraped cork for ornamenting screens, has brought us from another correspondent the description of a very simple and pretty way of using wine-bottle corks for covering baskets, flower-pot covers, etc., in fact almost anything that can be formed of a pasteboard foundation. Cut the corks in slices, a quarter inch in thickness, then cut these into quarters, thus making four pieces of each slice. Thread them just as you happen to take them up, on a long strong thread, close together. Wind the string of cork round and round the basket, sufficiently close to quite touch; and secure the thread neatly. Should a handle be wanted a *strong* wire must be used for the purpose, and an additional piece of pasteboard glued or strongly sewn on where the ends of wire are fastened, and then wind a thread of corks round and round the wire as close as possible. Of course the pasteboard foundation must be first covered with some suitable material: a bright ruby satin looks well for a basket.

**Tricycling.**—(1) *Please tell me what is the best style of costume for tricycling?* (2) *Is it necessary for girls always to wear gloves when cycling?*—(1) Much the neatest and most comfortable style is a close fitting, but very easy plain body, and a plain skirt with only sufficient pleats or gathers to give free play to the lower limbs. The skirt should be made on a foundation; the body lined with thin flannel, Jaeger, or other *woollen* material alone; and two or three outside pockets should be provided, one in the breast of the body for pocket-handkerchief. The dress material is also to be all wool; dark blue or purple, or dark grey or C.T.C. grey check, being most ladylike. Young ladies should ride without stays; if stays must be worn, they should be very light and loose. For underwear choose first a pair of good woollen combinations; in the heat of summer very little else will be needed while on the machine, if a wrap be taken to add while resting, but other garments may be added as needed, provided they be all wool, which is very important to prevent catching cold. Wear good thick stockings and shoes, not boots, which are fatiguing; tennis canvas shoes are excellent if the appearance is not objected to, or horse-skin shoes are very soft and light. (2) No lady ever rides without gloves, but in the summer many prefer to use Lisle thread. The head-dress will, of course, depend upon age and figure; but young ladies nearly always look well in plain sailor hats; when grown up, felt Alpines are more becoming to some faces; or a hat or Cambridge cap may be made up of same material as the dress. It is a general rule, however, that on a tricycle the plainest and neatest style always looks the "nattiest" and best, and most truly charming.

**Polishing Stones.**—*Can you tell me of an easy way to polish and cut pebbles and fossils without a machine?*—They can be ground down on any hard flat stone with sand and water, then using finer sand and water to smooth them, and finally polishing with putty-powder and water, used not on the grinding stone, but on a piece of thick flannel or cloth stretched on a board. It is, however, terribly slow work, and if time is of any value a simple lapidary's wheel will be repaid over and over again. A stone might be also

cut through *in time*, with a steel blade working in sand and water; but here again the revolving disc of steel is infinitely quicker in operation.

**Dyeing Hats.**—*I have several white straw hats which are rather dirty. Could you tell me any way in which I might dye them black, as they are hardly worth sending to the dyers?*—It is not easy to make a very good job of it. The easiest domestic method is to apply Judson's dye twice with a large soft brush, using plenty, and dissolving some gum arabic in the last lot, or else going over it with thin gum afterwards, to give a little gloss. The appearance may often be improved by using a black-lead brush; but as this rather comes off, the hat must be handled very carefully after this expedient.

**Cleaning Feathers.**—*Please tell me whether you can clean feather-beds by washing the feathers?*—No. The tick of course is washed, but all you can do with the feathers is to shake them well in a riddle or very coarse sieve, when the dust and dirt will fall through; then the feathers are all picked over and apart. If for good reasons more is necessary, the bed must be sent to the cleaner's.

**Frost and Plate.**—*Can you tell me if frosty weather tarnishes silver and electro-plate? I have had the care of silver and plate for over twenty years, and had no difficulty in keeping it clean, but during the late frosty weather it went like copper in a day or two, whether exposed in a room or shut up when done with. It was not so in the summer, so it is not the change of residence from the country to the seaside where we have been since May. The coachman complains of his plated harness going just the same during the night.*—The probable cause is the alternate deposition and evaporation of cold salt moisture, as the articles are by turns warmed and chilled. To mix the cleaning-powder with spirit instead of water, adding only a drop or two of oil, is a very great palliative of the difficulty.

**Scratches on Marble.**—*Do you know how scratches may be removed from black marble? In removing our clock from the mantelpiece, the servant scratched the plinth with a broken button on her dress, and it is a constant eyesore.*—The scratch can only be scoured or ground out, and the safest plan will be to employ a marble or monument mason, if there be one within reach. If not, a scratch caused in this way would probably be scoured down sufficiently by finely powdered pumice and water, polishing afterwards first with tripoli and water, and finally with putty-powder and water, used on flannel strained over a piece of board. The risk of amateur work is chiefly that of possibly making more scratches, or of not getting the polish perfectly up again.

**Painting on Velvet Soiled.**—*I have a painting on white velvet, which is much soiled, having been in use as a cushion. It is hand-painted, and in water-colours. I shall be grateful if you can tell me of any method of cleaning the velvet without removing the colours.*—Painting on velvet—especially on a white ground—is quite unsuitable for such uses, which may be rather termed abuse. The painting itself you cannot touch. All you can do will be to apply spirits of ammonia and water with a brush, as carefully as possible, to the plain portions, with a view to remove what you can of the stains; but white is a very difficult colour to handle, and it would be better to consult a professional cleaner. If, however, you can get it cleaner, of course you can raise the pile in the usual way afterwards, by holding it wrong side down over a hot flat-iron covered with two or three folds of wet cloth, touching here and there gently with a soft camel-hair round-nosed brush as needed.

**Ants.**—*We are troubled, as I find many of my friends and neighbours are, by numbers of little ants, and cannot get rid of them. Sir John Lubbock could only suggest carbolic acid or chloride of lime; these I find useless, as also is whitewash.*—The chief difficulty with ants is that you cannot properly get at them to apply the remedy; they would hardly stand carbolic acid, if it could only be got home to them. Persian powder persistently laid about everywhere and shaken down the cracks or holes may have effect, being fatal to small insects if it reaches them. Another remedy sometimes effectual is oil of pennyroyal, soaking bits of wadding in it and laying about wherever the ants are seen, and renewing them from time to time. In the season fresh green bunches of the herb have much the same effect. We have, however, been beaten several times by this problem, and if any of our readers can help us shall be very glad.

**Dyeing Feathers.**—*Could I dye some red feathers myself? I washed them with soap and water and then curled them; but some of the red came off and they looked as if they were dirty.*—Judson's Dyes will answer very well in the ordinary way, but we do not feel sure how the washing and former dye may affect it. Probably it will not.

**Sponge-Cakes Sticking.**—*Can you please tell me how to make a sponge-cake in an ornamentally shaped tin that will turn out without any of the crust remaining in the tin? I have made dozens of experiments in every way that I can think of, and my cakes are light and right in every way, except that while about two-thirds of the cake turns out perfect, the crust of the upper part always adheres to the bottom of the tin, and so spoils the appearance of the cake.*—It is often a difficulty, but the probability is that you do not butter the bottom part of the mould thickly enough; it takes quite a thick coat of butter. Very often a good sprinkling of finely-powdered loaf sugar over the butter, before pouring in the cake-batter, is a great help. Finally, it is possible you finish the baking with rather too fierce a bottom heat under that part of the mould.

**Furmety or Frumenty.**—*Please tell me of a good recipe for "Furmity." Can you also tell me how to clean the metal of an ordinary banjo? It has become very yellow, and a leather will not brighten it.*—Take a quarter of a pint of dry wheat and boil in milk till tender, but not to a pulp. To the swelled wheat add a quart of new milk, a stick of cinnamon, and a little nutmeg (the spice to taste), and about three ounces each of sugar and washed currants. Boil all together again for a quarter of an hour, then take off the fire and stir in the beaten yolks of three eggs, non-teetotallers adding a wine-glassful of brandy. It takes about three hours to boil the wheat first. It is very probable that the plating of the banjo is worn through to the brass underneath; if not, you will find whiting rubbed on with a little turpentine by a leather give a good polish.

**Knitted Gloves.**—*Could you tell me how to knit a pair of winter gloves?*—Full directions would occupy three-quarters of a column, which we cannot give to it. You will find very good ones in "The Knitting and Crochet Work Book," 6*d.*, published by Thomsons Brothers, Kilmarnock; or this or similar printed ones can be bought at any shop where they sell Berlin wool materials.

**Dressing-table—Grease Stains.**—In reference to queries under these heads in our December part, a correspondent suggests that art muslins make beautiful and varied draperies; also a material called cretonnette, in various oriental designs, and oriental printed cabinet cloths, which she has bought at Whiteley's, under the name of Saxony. She has likewise found Algerian or Zulu grass cloths make tasteful and lasting coverings for various kinds of furniture. For getting out grease she prefers a red-hot poker held an inch or two above the spot, which first melts and then evaporates the grease. We have ourselves found this a little risky in the way of scorching or frizzling on some fabrics such as that described.

WAITING FOR THE CHOIR.

# THE STORY OF FRANCIS CLUDDE.

BY STANLEY J. WEYMAN, AUTHOR OF "THE HOUSE OF THE WOLF," ETC

## CHAPTER XI.—A FOUL BLOW.

"WHAT," CRIED THE DUCHESS "WHAT HAS HAPPENED?"

THEY none of them believed me, it seemed; and smarting under Mistress Anne's ridicule, hurt by even the Duchess's kindly incredulity, what could I do? Only assert what I had asserted already, that it was undoubtedly Clarence, and that before twenty-four hours elapsed they would have proof of my words.

At mention of this possibility Master Bertie looked up. He had left the main part in the discussion to others, but now he intervened. "One moment!" he said. "Take it that the lad is right, Master Lindstrom. Is there any precaution we can adopt, any back door, so to speak, we can keep open, in case of an attempt to arrest us being made? What would be the line of our retreat to Wesel?"

"The river," replied the Dutchman, promptly.

"And the boats are all at the landing-stage?"

"They are, and for that reason they are useless in an emergency," our host answered thoughtfully. "Knowing the place, any one sent to surprise and arrest us would secure them first, and the bridge. Then they would have us in a trap. It might be well to take a boat round, and moor it in the little creek in the further orchard," he added, rising. "It is a good idea, at any rate. I will go and do it."

He went out, leaving us four—the Duchess, her husband, Anne, and myself—sitting round the lamp.

"If Master Carey is so certain that it was Clarence," my lady began, "I think he ought to——"

"Yes, Kate?" her husband said. She had paused and seemed to be listening.

"Ought to open that letter he has!" she continued impetuously. "I have no doubt it is a letter to Clarence. Now the rogue has come on the scene again, the lad's scruples ought not to stand in the way. They are all nonsense. The

letter may throw some light on the Bishop's schemes and Clarence's presence here; and it should be read. That is what I think."

"What do you say, Carey?" her husband asked, as I kept silence. "Is not that reasonable?"

Sitting with my elbows on the table, I twisted and untwisted the fingers of my clasped hands, gazing at them the while as though inspiration might come of them. What was I to do? I knew that the three pairs of eyes were upon me, and the knowledge distracted me, and prevented me really thinking, though I seemed to be thinking so hard. "Well," I burst out at last, "the circumstances are certainly altered. I see no reason why I should not——"

Crash!

I stopped, uttering an exclamation, and we all sprang to our feet. "Oh, what a pity!" the Duchess cried, clasping her hands. "You clumsy, clumsy girl! What have you done?"

Mistress Anne's sleeve as she turned had swept from the table a Florentine jug, one of Master Lindstrom's greatest treasures, and it lay in a dozen fragments on the floor. We stood and looked at it, the Duchess in anger, Master Bertie and I in comic dismay. The girl's lip trembled, and she turned quite white as she contemplated the ruin she had caused.

"Well, you have done it now!" the Duchess said pitilessly. What woman could ever overlook clumsiness in another woman! "It only remains to pick up the pieces, miss. If a man had done it—but there, pick up the pieces. You will have to make your tale good to Master Lindstrom afterwards."

I went down on my knees and helped Anne, the annoyance her incredulity had caused me forgotten. She was so shaken that I heard the bits of ware in her hand clatter together. When we had picked up all, even to the smallest piece, I rose, and the Duchess returned to the former subject. "You will open this letter, then?" she said; "I see you will. Then the sooner the better. Have you got it about you?"

"No, it is in my bedroom," I answered. "I hid it away there, and I must fetch it. But do you think," I continued, pausing as I opened the door for Mistress Anne to go out with her double handful of fragments, "it is absolutely necessary to read it, my lady?"

"Most certainly," she answered, gravely nodding with each syllable, "I think so. I will be responsible." And Master Bertie nodded also.

"So be it," I said reluctantly. And I was about to leave the room to fetch the letter—my bedroom being in a different part of the house, only connected with the main building by a covered passage—when our host returned. He told us that he had removed a boat, and I stayed awhile to hear if he had anything more to report, and then, finding he had not, went out to go to my room, shutting the door behind me.

The passage I have mentioned, which was merely formed of rough planks, was very dark. At the nearer end was the foot of the staircase leading to the upper rooms. Farther along was a door in the side opening into the garden. Going straight out of the lighted room, I had almost to grope my way, feeling the walls with my hands. When I had about reached the middle I paused. It struck me that the door into the garden must be open, for I felt a cold draught of air strike my brow, and saw, or fancied I saw, a slice of night sky and the branch of a tree waving against it. I took a step forward, slightly shivering in the night air as I did so, and had stretched out my hand with the intention of closing the door, when a dark form rose suddenly close to me, I saw a knife gleam in the starlight, and the next moment I reeled back into the darkness of the passage, a sharp pain in my breast.

I knew at once what had happened to me, and leaned a moment against the planking with a sick, faint feeling, saying to myself, "I have it this time!" The attack had been so sudden and unexpected, I had been taken so completely off my guard, that I had made no attempt either to strike or to clutch my assailant, and I suppose only the darkness of the passage saved me from another blow. But was one needed? The hand which I had raised instinctively to shield my throat was wet with the warm blood trickling fast down my breast. I staggered back to the door of the parlour, groped blindly for the latch, seemed to be an age finding it, found it at last, and walked in.

The Duchess sprang up at sight of me. "What," she cried, backing from me, "what has happened?"

"I have been stabbed," I said, and I sat down.

It amused me afterwards to recall what they all did. The Dutchman stared, my lady screamed loudly, Master Bertie whipped out his sword; he could make up his mind quickly enough at times.

"I think he has gone," I said faintly.

The words brought the Duchess to her knees by my chair. She tore open my doublet, through which the blood was oozing fast. I made no doubt that I was a dead man, for I had never been wounded in this way before, and the blood scared me. I remember my prevailing idea was a kind of stunned pity for myself. Perhaps later—I hope so—I should have come to think of Petronilla and my uncle and other people. But before this stage was reached, the Duchess reassured me. "Courage, lad," she cried heartily. "It is all right, Dick. The villain struck him on the breastbone an inch too low, and has just ripped up a scrap of skin. It has blooded him for the spring, that is all. A bit of plaster——"

"And a drink of strong waters," suggested the Dutchman, soberly—his thoughts were always to the point when they came.

"Yes, that too," quoth my lady, "and he will be all right."

I thought so myself when I had emptied the cup they offered me. I had been a good deal shaken by the events of the day. The sight of blood had further upset me. I really think it possible I might have died of this slight hurt and my imagination if I had been left to myself. But the Duchess's assurance and the draught of schnapps, which seemed to send new blood through my veins, made me feel ashamed of myself. If the Duchess would have let me, I would at once have

gone to search the premises; as it was, she made me sit still while she ran to and fro for hot water and plaster and the men searched the lower rooms and secured the door afresh.

"And so you could see nothing of him?" our host asked, when he and Master Bertie returned, weapons in hand. "Nothing of his figure or face?"

"Nothing, save that he was short," I answered; "shorter than I am, at any rate, and I fancy a good deal."

"A good deal shorter than you are?" my lady said uneasily; "that is no clue. In this country nine people out of ten are that. Clarence, now, is not."

"No," I said; "he is about the same height. It was not Clarence."

"Then who could it be?" she muttered, rising, and then with a quick shudder sitting down again. "Heaven help us, we seem to be in the midst of foes! What could be the motive? And why should the villain have selected you? Why pick you out?"

Thereupon a strange thing happened. Three pairs of English eyes met, and signalled a common message eye to eye. No word passed, but the message was "Van Tree!" When we had glanced at one another we looked all of us at our host—looked somewhat guiltily. He was deep in thought, his eyes on the stove; but he seemed to feel our gaze upon him, and he looked up abruptly. "Master Van Tree," he said, and stopped.

"You know him well?" the Duchess said, appealing to him softly. We felt a kind of sorrow for him, and some delicacy, too, about accusing one of his countrymen of a thing so cowardly. "Do you think it is possible," she continued with an effort—"possible that he can have done this, Master Lindstrom?"

"I have known him from a boy," the merchant said, looking up, a hand on either knee, and speaking with a simplicity almost majestic, "and never knew him do a mean thing, madam. I know no more than that." And he looked round on us.

"That is a good deal; still, he went off in a fit of jealousy when Master Carey brought Dymphna home. We must remember that."

"Yes, I would he knew the rights of that matter," said the Dutchman, heartily.

"And he has been hanging about the place all day," my lady persisted.

"Yes," Master Lindstrom rejoined patiently; "yet I do not think he did this."

"Then who did?" she said, somewhat nettled.

That was the question. I had my opinion, as I saw Master Bertie and the Duchess had. I did not doubt it was Van Tree. Yet a thought struck me. "It might be well," I suggested, "that some one should ask Mistress Anne whether the door was open when she left the room. She passed out just in front of me."

"But she does not go by the door," my lady objected.

"No, she would turn at once and go upstairs," I agreed. "But she could see the door from the foot of the stairs—if she looked that way, I mean."

The Duchess assented, and went out of the room to put the question. We three, left together, sat staring at the dull flame of the lamp, and were for the most part silent, Master Bertie only remarking that it was after midnight. The suspicion he and I entertained of Van Tree's guilt seemed to raise a barrier between us and our host. My wound, slight as it was, smarted and burned, and my head ached. After midnight, was it? What a day it had been!

When the Duchess came back, as she did in a few minutes, both Anne and Dymphna came with her. The girls had risen hastily, and were shivering with cold and alarm. Their eyes were bright, their manner was excited. They were full of sympathy and horror and wonder, as was natural; of nervous fear for themselves, too. But my lady cut short their exclamations. "Anne says she did not notice the door," she said.

"No," the girl answered, trembling visibly as she spoke. "I went up straight to bed. But who could it be? Did you see nothing of him as he struck you? Not a feature? Not an outline?"

"No," I murmured.

"Did he not say a word?" she continued with strange insistence. "Was he tall or short?" Her dark eyes dwelling on mine seemed to probe my thoughts, as though they challenged me to keep anything back from her. "Was it the man you hurt this morning?" she suggested.

"No," I answered reluctantly. "This man was short."

"Short was he? Was it Master Van Tree then?"

We who felt almost certain that it was Van Tree started nevertheless at hearing the charge put into words before Dymphna. I wondered, and I think the others did too, at Mistress Anne's harshness. Even my lady, so blunt and outspoken by nature, had shrunk from trying to question the Dutch girl about her lover. We looked at Dymphna, wondering how she would take it.

We had forgotten that she could not understand English. But this did not serve her; for without a pause Mistress Anne turned to her, and unfalteringly said something in her scanty Dutch which came to the same thing. A word or two of questioning and explanation followed. Then the meaning of the accusation dawned at last on Dymphna's mind. I looked for an outburst of tears or protestations. Instead, with a glance of wonder and great scorn, with a single indignant widening of her beautiful eyes, she replied by a curt Dutch sentence.

"What does she say?" my lady exclaimed eagerly.

"She says," replied Master Lindstrom, who was looking on gravely, "that it is a base lie, madam."

On that we became spectators. It seemed to me, and I think to all of us, that the two girls stood apart from us in a circle of light by themselves; confronting one another with sharp glances as though a curtain had been raised from between them, and they saw one another in their true colours and recognised some natural antagonism, or, it might be, some rivalry each in the other. I think I was not peculiar in feeling this, for we all kept silence for a space as though expecting some-

thing to follow. In the middle of this silence there came a low rapping at the door.

One uttered a faint shriek; another stood as if turned to stone. The Duchess cried for her child. The rest of us looked at one another. Midnight was past. Who could be abroad, who could want us at this hour? As a rule we should have been in bed and asleep long ago. We had no neighbours save the cotters on the far side of the island. We knew of no one likely to arrive at this time with any good intent.

"I will open?" said Master Lindstrom. But he looked doubtfully at the women-folk as he said it.

"One minute," whispered the Duchess. "That table is solid and heavy. Could you not——"

"Put it across the door?" concluded her husband. "Yes we will." And it was done at once, the two men—my lady would not let me help—so arranging it that it prevented the door being opened to its full width.

"That will stop a rush," said Master Bertie with satisfaction.

It did strengthen the position, yet it was a nervous moment when our host prepared to lower the bar. "Who is there?" he cried loudly.

We waited, listening and looking at one another, the fear of arrest and the horrors of the Inquisition looming large in the minds of some of us at least. The answer, when it came, did not reassure us. It was uttered in a voice so low and muffled that we gained no information, and rather augured treachery the more. I remember noticing how each took the crisis: how Mistress Anne's face was set hard, and her breath came in jerks; how Dymphna, pale and trembling, seemed yet to have eyes only for her father; how the Duchess faced the entrance like a queen at bay. All this I took in at a glance. Then my gaze returned to Master Lindstrom, as he dropped the bar with a jerk. The door was pushed open at once as far as it would go. A draught of cold air came in, and with it Van Tree. He shut the door behind him.

Never were six people so taken aback as we were. But the newcomer, whose face was flushed with haste and excitement, observed nothing. Apparently he saw nothing unexpected even in our presence downstairs at that hour, nothing hostile or questioning in the half circle of astonished faces turned towards him. On the contrary, he seemed pleased. "Ah!" he exclaimed gutturally. "It is well! You are up! You have taken the alarm!"

It was to me he spoke, and I was so surprised by that, and by his sudden appearance, so dumbfounded by his easy address and the absence of all self-consciousness on his part, so struck by a change in him, that I stared in silence. I could not believe that this was the same half-shy, half-fierce young man who had flung away a few hours before in a passion of jealousy. My theory that he was the assassin seemed on a sudden extravagant, though here he was on the spot. When Master Lindstrom asked "Alarm! What alarm?" I listened for his answer as I should have listened for the answer of a friend and ally, without hesitation, without distrust. For in truth the man was transfigured; changed by the rise of something to the surface which ordinarily lay hid in him. Before, he had seemed churlish, awkward, a boor. But in this hour of our need and of his opportunity he showed himself as he was. Action and purpose lifted him above his outward seeming. I caught the generous sparkle in his eye, and trusted him.

"What!" he said, keeping his voice low. "You do not know? They are coming to arrest you. Their plan is to surround the house before daybreak. Already there is a boat lying in the river watching the landing-stage."

"Whom are they coming to arrest?" I asked. The others were silent, looking at this strange messenger with mingled feelings.

"All, I fear," he replied. "You, too, Master Lindstrom. Some one has traced your English friends hither and informed against you. I know not on what ground you are included, but I fear the worst. There is not a moment to be lost if you would escape by the bridge, before the troop who are on the way to guard it arrives."

"The landing-stage, you say, is already watched?" our host asked, his phlegmatic coolness showing at its best. His eyes roved round the room, and he tugged, as was his habit when deep in thought, at his beard. I felt sure that he was calculating which of his possessions he could remove.

"Yes," Van Tree answered. "My father got wind of the plan in Arnheim. An English envoy arrived there yesterday on his way to Cleves, or some part of Germany. It is rumoured that he has come out of his road to inquire after certain English fugitives whom his Government are anxious to seize. But come, we have no time to lose! Let us be off! Let us go!"

"Do you come too?" Master Lindstrom said, pausing in the act of turning away. He spoke in Dutch, but by some inspiration born of sympathy I understood both his question and the answer.

"Yes, I come. Where Dymphna goes I go, and where she stops I stop, though it be at Madrid itself," the young man answered gallantly. His eye kindled, and he seemed to grow taller and to gain majesty. The barrier of race, which had hindered me from viewing him fairly before, fell in a trice. I felt now only a kindly sorrow that he had done this noble thing, and not I. I went to him and grasped his hand; and though I said nothing, he seemed after a single start of surprise to understand me fully. He understood me even better, if that were possible, an hour later, when Dymphna had told him of her adventure with the Spaniard, and he came to me to thank me.

Ordered myself to be idle, I found all busy round me, busy with a stealthy diligence. Master Lindstrom was packing his plate. Dymphna, pale, but with soft happy eyes—for had she not cause to be proud?—was preparing food and thick clothing. The Duchess had fetched her child and was dressing it for the journey. Master Bertie was collecting small matters and looking to our arms. In one or other of these occupations—I can guess in which—Van Tree was giving his aid. And so, since the Duchess would not let me do anything, it chanced that presently I found myself left alone for a few minutes with Anne.

I was not watching her. I was gnawing my nails in a fit of despondency, reflecting that I was nothing but a hindrance and a drawback to my friends, since whenever a move had to be made I was sure to be invalided, when I became aware, through some mysterious sense, that my companion, who was kneeling on the floor behind me, packing, had desisted from her work and was gazing fixedly at me. I turned. Yes, she was looking at me; her eyes, in which a smouldering fire seemed to burn, contrasting vividly with her pale face and contracted brows. When she saw that I had turned—of which at first she did not seem aware—she rose and came to me, and laid a hand on my shoulder and leaned over me. A feeling that was very like fright fell upon me, her manner was so strange. "What is it?" I stammered, as she still pored on me in silence, still maintained her attitude. "What is the matter, Anne?"

that has been laid carefully enough. What is this tale of an English envoy on his way to Germany? Rubbish! Rubbish, I tell you."

"But Clarence——"

"Bah! It was all your fancy!" she cried fiercely, her eyes for the moment flitting to the door, then returning to my face. "How should he find us here? Or what has Clarence to do with an English envoy?"

"I do not know," I said. She had not in the least persuaded me. In a rare moment I had seen into Van Tree's soul and trusted him implicitly. "Please take care," I added, wincing under her hand. "You hurt me!"

She sprang back with a sudden change of countenance as if I had struck her, and for a moment cowered away from me, her former passion still apparent fighting for the mastery in her face. I set down her condition to terror at the plight we

"STOP! STOP!" I CRIED IN HORROR; "YOU WILL RUIN ALL!"

"Are you *quite* a fool?" she whispered, her voice almost a hiss, her hot breath on my cheek. "Have you no sense left, that you trust that man?"

For a moment I failed to understand her. "What man?" I said. "Oh, Van Tree!"

"Ay, Van Tree! Who else? Will you go straight into the trap he has laid for you?" She moistened her lips with her tongue, as though they were parched. "You are all mad! Mad, I think! Don't you see," she continued, stooping over me again, and whispering hurriedly, her wild eyes close to mine, "that he is jealous of you?"

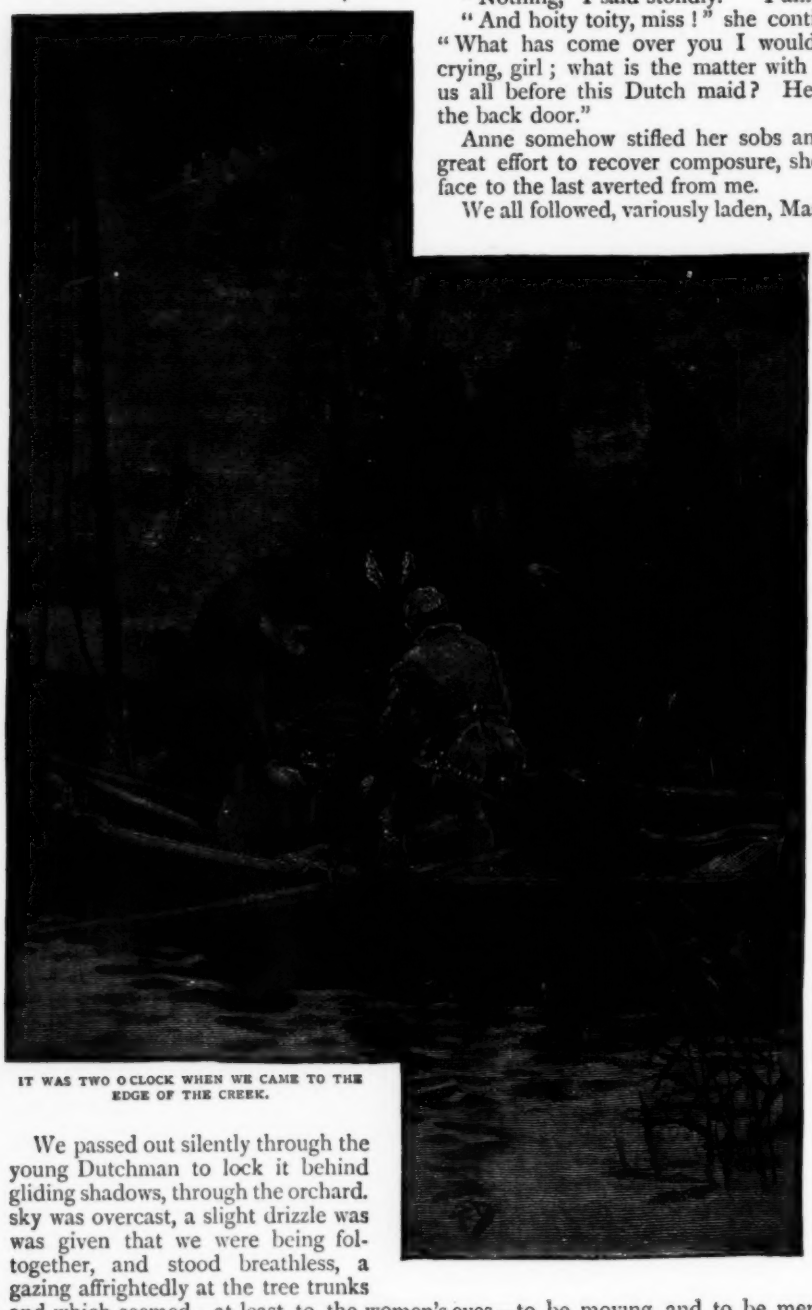
"He was," I said uneasily. "That is all right now."

"He was? He is!" she retorted. "He went away wild with you. He comes back smiling and holding out his hand. Do you trust him? Don't you see—don't you see," she cried, rocking me to and fro with her hand in her excitement, "that he is fooling you? He is leading us all into a trap were all in, or to vexation that no one would take her view. The next moment I went farther. I thought her mad when she turned abruptly from me and, flying to the door by which Van Tree had entered, began with trembling fingers to release the pin which confined the bar.

"Stop! stop! you will ruin all!" I cried in horror. "They can see that door from the river, and if they see the light, they will know we are up and have taken the alarm; and they may make a dash to secure us. Stop, Anne! Stop!" I cried. But the girl was deaf. She tugged desperately at the pin, and had already loosened the bar when I caught her by the arms, and, pushing her away, set my back against the door. "Don't be foolish!" I said gently. "You have lost your head. You must let us men settle these things, Anne."

She was indeed beside herself, for she faced me during a second or two as though she would spring upon me and tear me from the door. Her hands

worked, her eyes gleamed, her strong white teeth showed themselves. I shuddered. I had never pictured her looking like that. Then, as steps sounded on the stairs and cheerful voices—cheerful they seemed to me as they broke in on that strange scene—drew nearer, she turned and, walking deliberately to a seat, fell to weeping hysterically.



"What are you doing to that door?" cried the Duchess sharply, as she entered with the others. I was securing the bar again.

"Nothing," I said stolidly. "I am seeing that it is fast."

"And hoity toity, miss!" she continued, turning to Anne. "What has come over you I would like to know? Stop crying, girl; what is the matter with you? Will you shame us all before this Dutch maid? Here, carry these things to the back door."

Anne somehow stifled her sobs and rose. Seeming by a great effort to recover composure, she went out, keeping her face to the last averted from me.

We all followed, variously laden, Master Lindstrom and Van Tree, who carried between them the plate-chest, being the last to leave. There was not one of us—even of us who had only known the house a few weeks—who did not heave a sigh as we passed out of the warm lamp-lit parlour, which, littered as it was with the débris of packing, looked still pleasant and comfortable in comparison with the darkness outside and the uncertain future before us. What, then, must have been the pain of parting to those who had never known any other home? Yet they took it bravely. To Dymphna, Van Tree's return had brought great happiness. To Master Lindstrom, any ending to a long series of anxieties and humiliations was welcome. To Van Tree—well, he had Dymphna with him, and his side of the plate-chest was heavy, and gave him ample employment.

IT WAS TWO O'CLOCK WHEN WE CAME TO THE EDGE OF THE CREEK.

We passed out silently through the back door, leaving the young Dutchman to lock it behind us, and flitted, a line of gliding shadows, through the orchard. It was two o'clock, the sky was overcast, a slight drizzle was falling. Once an alarm was given that we were being followed; and we huddled together, and stood breathless, a clump of dark figures gazing affrightedly at the tree trunks which surrounded us, and which seemed—at least to the women's eyes—to be moving, and to be closing in on us. But the alarm was groundless, and with no greater mishap than a few stumbles when we came to the slippery edge of the creek, we reached the boat, and one by one, admirably ordered by our host, got in and took our seats. Van Tree and Master Lindstrom pushed us off; then they swung themselves in and paddled warily along, close under the bank, where the shadows of the poplars fell across us, and our figures blended darkly with the line of rushes on the shore.

CHAPTER XII.—ANNE'S PETITION.

WE coasted along in this silent fashion, nearly as far as the hamlet and bridge, following, but farther inshore, the course which Master Lindstrom and I had taken when on our way to bury the Spaniard. A certain point gained, at a signal from our host we struck out into the open, and rowed swiftly towards the edge of the marsh. This was the critical moment; but, so far as we could learn, our passage was unnoticed. We reached the fringe of rushes, with a prolonged hissing sound the boat pushed through them; a flight of water-fowl rose, whirring and clapping about us, and we floated out into a dim misty lake, whose shores and surface stretched away on every side, alike dark, shifting, and uncertain.

Across this the Dutchman steered us, bringing us presently to a narrow opening, through which we glided into a second and smaller mere. At the farther end of this one the way seemed barred by a black impenetrable wall of rushes, which rose far above our heads. But the tall stems bent slowly with many a whispered protest before our silent onset, and we slid into a deep water-lane, here narrow, there widening into a pool, in one place dark, in another reflecting the grey night sky. Down this we sped swiftly, the sullen plash of the oars and the walls of rushes always with us. For ourselves, we crouched still and silent, shivering and listening for sounds of pursuit; now starting at the splash of a frog, again shuddering at the cry of a night-bird. The Duchess, her child, and I were in the bows, Master Lindstrom, his daughter, and Mistress Anne in the stern. They had made me comfortable with the baggage and some warm coverings, and would insist on treating me as helpless. Even when the others began to talk in whispers, the Duchess enjoined silence on me, and bade me sleep. Presently I did so, my last impression one of unending water-ways and shoreless, shadowy lakes.

When I awoke the sun was high and the scene was changed indeed. We lay on the bosom of a broad river, our boat seeming now to stand still as the sail flapped idly, now to heel over and shoot forward as the light breeze struck us. The shores abreast of us were still low and reedy, but ahead the slopes of green wooded hills rose gently from the stream. Master Bertie was steering, and, seeing me lift my head, greeted me with a smile. The girls in the stern were covered up and asleep. Amidships, too, Master Lindstrom and Van Tree had curled themselves up between the thwarts, and were slumbering peacefully. I turned to look for the Duchess, and found her sitting wide awake at my elbow, her eyes on her husband.

"Well," she said smiling, "do you feel better now? You have had a good sleep."

"How long have I been asleep, please?" I asked, bewildered by the sunshine, by the shining river and the green hills, by the fresh morning air, by the change in everything; and answering in a question, as people freshly aroused do nine times out of ten. "Where are we?"

"You have been asleep nearly six hours, and we are on the Rhine, near Emmerich," she answered smiling. She was pale, and the long hours of watching had drawn dark circles round her eyes. But the old undaunted courage shone in them still, and her smile was as sweet as ever.

"Have we passed the frontier?" I asked eagerly.

"Well, nearly," she answered. "But how does your wound feel?"

"Rather stiff and sore," I said ruefully, after making an experiment by moving my body to and fro. "And I am very thirsty, but I could steer."

"So you shall," she said. "Only first eat something. We broke our fast before the others lay down. There is bread and meat behind you, and some hollands and water in the bottle."

I seized the latter and drank greedily. Then, finding myself hungry now I came to think about it, I fell upon the eatables.

"You will do now, I think," she said, when she had watched me for some time.

I laughed for answer, pleased that the long dark night, its gloom and treachery were past. But its memories remained, and presently I said, "If Van Tree did not try to kill me—and I am perfectly sure he did not——"

"So am I," she said. "We were all wrong."

"Then," I continued, looking at her gravely, "who did? that is the question. And why?"

"You are sure that it was not the Spaniard whom you hurt in defence of Dymphna?" my lady asked.

"Quite sure."

"And sure that it was not Clarence?" she persisted.

"Quite sure. It was a short man," I explained again, "and dressed in a cloak. That is all I can tell about him."

"It might be some one employed by Clarence," she suggested, her face gloomy, her brows knit.

"True, I had not thought of that," I answered. "And it reminds me. I have heard so much of Clarence——"

"And seen some little—even that little more than was good for you."

"Yes, he has had the better of me, on both occasions," I allowed. "But I was going to ask you," I continued, "to tell me something about him. He was your steward, I know. But how did he come to you? How was it you trusted him?"

"We are all fools at times," she answered grimly. "We wanted to have persons of our own faith about us, and he was highly commended to us by Protestants abroad, as having seen service in the cause. He applied to us just at the right moment too. And at the first we felt a great liking for him. He was so clever in arranging things, he kept such excellent order among the servants; he was so ready, so willing, so plausible! Oh!" she added bitterly, "he had ways that enabled him to twist nine women out of ten round his fingers! Richard was fond of him; I liked him; we had talked more than once of how we might advance his interests. And then, like a thunderbolt on a clear day, the knowledge of his double-dealing fell upon us. We learned that he had been seen talking with a known agent of

Gardiner, and this at a time when the Bishop was planning our ruin. We had him watched, and just when the net had all but closed round us we discovered that he had been throughout in Gardiner's pay."

"Ah!" I said viciously. "The oddest thing to me is the way he has twice escaped me when I had him at the sword's point!"

"The third time may bring other fortune, Master Francis," she answered smiling. "Yet be wary with him. He is a good swordsman, as my husband, who sometimes fenced with him, will tell you."

"He can be no common man," I said.

"He is not. He is well-bred, and has seen service. He is at once bold and cunning. He has a tongue would win most women, and a hardihood that would chain them to him. Women love bold men," my lady added naïvely. And she smiled on me—yet humorously—so that I blushed.

There was silence for a moment. The sail flapped, then filled again. How delicious this morning after that night, this bright expanse after the dark sluggish channels! Far away in front a great barge, high-laden with a mighty stack of rushes, crept along beside the bank, the horse that drew it covered by a kind of knitted rug. When my lady spoke next, it was abruptly. "Is it Anne?" she asked.

I knew quite well what she meant, and blushed again. I shook my head.

"I think it was going to be," she said sagely, "only Mistress Dymphna came upon the scene. You have heard the story of the donkey halting between two bundles of hay, Master Francis? And in the multitude of sweethearts there is safety."

"I do not think that was my case," I said. Instinctively my hand went to my breast, in which Petronilla's velvet sword-knot lay safe and warm. The Duchess saw the gesture and instantly bent forward and mimicked it. "Ha! ha!" she cried, leaning back with her hands clasped about her knees, and her eyes shining with fun and amusement. "Now I understand. You have left her at home; now, do not deny it, or I will tell the others. Be frank and I will keep your secret, on my honour."

"She is my cousin," I said, my cheeks hot.

"And her name?"

"Petronilla."

"Petronilla?" my lady repeated shrewdly. "That was the name of your Spanish grandmother, then?"

"Yes, madam."

"Petronilla? Petronilla?" she repeated, stroking her cheek with her hand. "She would be before my time, would she not? Yet there used to be several Petronillas about the court in Queen Catherine of Aragon's days, I remember. There was Petronilla de Vargas for one. But there, I guess at random. Why do you not tell me more about yourself, Master Francis? Do you not know me well enough now?"

"There is nothing to tell, madam," I said in a low voice.

"Your family? You come, I am sure, of a good house."

"I did, but it is nothing to me now. I am cut off from it. I am building my house afresh. And," I added bitterly, "I have not made much way with it yet."

She broke, greatly to my surprise, into a long peal of laughter. "Oh, you vain boy!" she cried. "You valiant castle-builder! How long have you been about the work? Three months? Do you think a house is to be built in a day? Three months, indeed? Quite a lifetime!"

Was it three months? It seemed to me to be fully three years. I seemed to have grown more than three years older since that February morning when I had crossed Arden Forest with the first light, and looked down on Wootton Wawen sleeping in its vale, and roused the herons fishing in the bottoms.

"Come, tell me all about it!" she said abruptly. "What did you do to be cut off."

"I cannot tell you," I answered.

A shade of annoyance clouded her countenance. But it passed away almost on the instant. "Very well," she said, with a little nod of disdain and a pretty grimace. "So be it. Have your own way. But I prophesy you will come to me with the tale some day."

I went then and took Master Bertie's place at the tiller; and, he lying down, I had the boat to myself until noon, and drew no little pleasure from the placid picture which the moving banks and the wide river presented. About noon there was a general uprising; and, coming immediately afterwards to a little island lying close to one bank, we all landed to stretch our legs and refresh ourselves after the confinement on board.

"We are over the border now and close to Emmerich," said Master Lindstrom, "though the mere line of frontier will avail us little if the Spanish soldiers can by hook or crook lay hands on us! Therefore, we must lose no time in getting within the walls of some town. We should be fairly secure for a few days either in Wesel or Santon."

"I thought Wesel was the point we were making for," Master Bertie said in some surprise.

"It was Wesel I mentioned the other day," the Dutchman admitted frankly. "And it is the bigger town and the stronger. But I have more friends in Santon. To Wesel the road from Emmerich runs along the right bank. To Santon we go by a cross-country road, starting from the left bank opposite Emmerich, a road longer and more tedious. But we are much less likely to be followed that way than along the Wesel road, and on second thoughts I incline to Santon."

"But why adopt either road? Why not go on by river?" I asked.

"Because we should be overtaken. The wind is falling, and the boat," our late host explained more truly than politely, "with the women in it is heavy."

"I understand," I said. "And you feel sure we shall be pursued?"

For answer he pointed with a smile to his plate-chest. "Quite sure," he added. "With that before them they will think nothing of the frontier. I fancy

that for you, if the English Government be in earnest, there will be no absolutely safe place short of the free city of Frankfort. Unless indeed you have interest with the Duke of Cleves."

"Ah!" said the Duchess. And she looked at her husband.

"Ah!" said Master Bertie, and he looked very blankly at his wife. So that I did not derive much comfort from that suggestion.

"Then it is Santon, is it?" said my lady.

"That first, at any rate. Then, if they follow us along the Wesel road, we shall still give them the slip."

So it was settled, neither Van Tree nor the girls having taken any part in the discussion. The former and Dymphna were talking aside, and Mistress Anne was sitting low down on the bank with her feet almost in the water, immersed to all appearance in her own thoughts. There was a little bustle as we rose to get into the boat, which we had drawn up on the landward side of the island so as to be invisible from the main channel; and in the middle of this I was standing with one foot in the boat and one on shore taking from Anne various articles which we had landed for rearrangement, when she whispered to me that she wanted to speak to me alone.

"I want to tell you something," she said, raising her eyes to my face, and then averting them. "Follow me this way."

She strolled as if accidentally twenty or thirty paces along the bank; and in a minute I joined her. I found her gazing down the river in the

'YOU DO NOT SEE ANYTHING, DO YOU?"

direction from which we had come. "What is it?" I said anxiously. "You do not see anything, do you?" For there had been a hint of bad news in her voice.

She dropped the hand with which she had been shading her eyes and turned to me. "Master Francis, you will not think me very foolish?" she said. Then I perceived that her lip was quivering and that there were tears in her eyes. They were very beautiful eyes when, as now, they grew soft, and appeal took the place of challenge.

"What is it?" I replied, speaking cheerfully to reassure her. She had scarcely got over her terror of last night. She trembled as she stood.

"It is about Santon," she answered with a miserable little catch in her voice. "I am so afraid of going there! Master Lindstrom says it is a rough long road, and when we are there we are not a bit farther from those wretches than at Wesel, and—and——"

"There, there!" I said. She was on the point of bursting into tears, and was clearly much overwrought. "You are making the worst of it. If it were not for Master Lindstrom I should be inclined to choose Wesel myself. But he ought to know best."

"But that is not all," she said, clasping her hands and looking up at me with her face grown full of solemn awe. "I have had a dream."

"Well, but dreams——" I objected.

"You do not believe in dreams?" she said, dropping her head sorrowfully.

"No, no; I do not say that," I admitted, naturally startled. "But what was your dream?"

"I thought we took the road to Santon. And mind," she added earnestly, "this was before Master Lindstrom had uttered a word about going that way, or any other way save to Wesel. I dreamt that we followed the road through such a dreadful flat country, a country all woods and desolate moorland, under a grey sky, and in torrents of rain, to——"

"Well, well?" I said, with a passing shiver at the picture. She described it with a rapt absent air, which made me creep—as if even now she were seeing something uncanny.

"And then I thought that in the middle of these woods, about half-way to Santon, they overtook us, and there was a great fight."

"There would be sure to be that!" I muttered, with shut teeth.

"And I thought you were killed, and we women were dragged back! There, I cannot tell you the rest!" she added wildly. "But try, try to get them to go the old way. If not, I know evil will come of it. Promise me to try?"

"I will tell them your dream," I said.

"No, no!" she exclaimed still more vehemently. "They would only laugh. Madam does not believe in dreams. But they will listen to you if you say you think the other way better. Promise me you will! Promise me!" she pleaded, her hands clasping my arm, and her tearful eyes looking up to mine.

"Well," I agreed reluctantly, "I will try. After all, the shortest way may be the best. But if I do," I said kindly, "you must promise me in return not to be alarmed any longer, Anne."

"I will try," she said gratefully; "I will indeed, Francis."

We were summoned at that minute, for the boat

was waiting for us. The Duchess scanned us rather curiously as we ran up—we were the last. But Anne kept her word, and concealed her fears so bravely that as she jumped in from the bank her air of gaiety almost deceived me, and would have misled the sharpest-sighted person who had not been present at our interview, so admirably was it assumed.

We calculated that our pursuers would not follow us down the river for some hours. They would first have to search the island, and the watch which they had set on the landing-stage would lead them to suspect rather that we had fled by land. We hoped, therefore, to reach Emmerich unmolested. There Master Lindstrom said we could get horses; and he thought we might be safe in Santon by the following evening.

"If you really think we had better go to Santon," I said. This was an hour or two after leaving the island, and when we looked to sight Emmerich very soon, the hills which we had seen in front all day, and which were grateful to eyes sated with the monotony of Holland, being now pretty close to us.

"I thought that we had settled that," replied the Dutchman, promptly.

I felt they were all looking at me. "I look at it this way," I said, reddening. "Wesel is not far from Emmerich by the road. Should we not have an excellent chance of reaching it before our pursuers come up?"

"You might reach it," Master Lindstrom said gravely. "Though, again, you might not."

"And, Wesel once reached," I persisted, "there is less fear of violence being attempted there than in Santon. It is a larger town."

"True," he admitted. "But it is just this. Will you be able to reach Wesel? It is the getting there—that is the difficulty; the getting there before you are caught."

"If we have a good start, why should we not?" I urged; and urged it the more persistently, the more I found them opposed to it. Naturally there ensued a warm discussion. At first they all sided against me, save of course Anne, and she sat silent, though she was visibly agitated, as from minute to minute I or they seemed likely to prevail. But presently when I grew warmer, and urged again and again the strength of Wesel, my own party veered round, yet still with doubt and misgiving. The Dutchman shrugged his shoulders to the end and remained unpersuaded. But finally it was decided that I should have my own way. We would go to Wesel.

Every one knows how a man feels when he comes victorious out of such a battle. He begins on the instant to regret his victory and to see the possible evils which may result from it; to repent the hot words he has used in the strife and the declarations he has flung broadcast. That dreadful phrase, "I told you so!" rises like an avenging fury before his fancy. And he quails.

I felt all this the moment the thing was settled. But I was too young to back out and withdraw my words. I hoped for the best, and resolved inwardly to get the party mounted the moment we reached Emmerich.

I soon had the opportunity of proving this resolution to be more easily made than carried out. About three o'clock we reached the little town dominated, as we saw from afar, by an ancient minster, and, preferring not to enter it, landed at the steps of an inn a quarter of a mile short of the gates, and marking a point where we might take the road to Wesel, or crossing the river the road to Santon. Master Lindstrom seemed well known, but there were difficulties about the horses. The German landlord listened to his story with apparent sympathy—but no horses! We could not understand the tongue in which the two talked, but the Dutchman's questions, quick and animated for once, and the landlord's slow replies, reminded me of the foggy morning when in a similar plight we had urged the master of the Lion's Whelp to put to sea. And I feared a similar result.

"He says he cannot get so many horses to-night," said Master Lindstrom with a long face.

"Offer him more money!" quoth the Duchess.

"If we cannot have horses until the morning, we may as well go on in the boat," I urged.

"He says, too, that the water is out on the road," continued the Dutchman.

"Nonsense! Double the price!" cried my lady, impatiently.

I suppose that this turned the scale. The landlord finally promised that in an hour four saddle-horses for Master Bertie and the Duchess, Anne and myself should be ready, with a couple of pack-horses and a guide. Master Lindstrom, his daughter, and Van Tree would start a little later for Cleves, five miles on the road to Santon, if conveyance could be got. "And if not," our late host added, as we said something about our unwillingness to leave him in danger, "I shall be safe enough in the town, but I hope to sleep in Cleves."

It was all settled very hastily. We felt—and I in particular, since my plan had been adopted—an unreasonable impatience to be off. As we stood on the bank by the inn-door, we had a straight reach of river a mile long in full view below us; and now we were no longer moving ourselves, but standing still, expected each minute to see the Spanish boat with its crew of desperadoes sweep round the corner before our eyes. Master Lindstrom assured us that if we were once out of sight our pursuers would get no information as to the road we had taken either from the innkeeper or his neighbours. "There is no love lost between them and the Spaniards," he said shrewdly. "And I know the people here, and they know me. The burghers may not be very keen to come to blows with the Spaniards or to resent their foray. But the latter, on their part, will be careful not to go too far or to make themselves obnoxious."

We took the opportunity of supping then, not knowing when we might get food again. I happened to finish first, and, hearing the horses' hoofs, went out and watched the lads who were to be our guides fastening the baggage on the sumpter beasts. I gave them a hand—not without a wince or two, for the wound in my chest was painful—and while doing so had a flash of remembrance. I went to the unglazed window of the kitchen in which the

others sat, and leaned my elbows on the sill. "I say!" I said, full of my discovery, "there is something we have forgotten!"

"What?" asked the Duchess, rising and coming towards me, while the others paused in their meal to listen.

"The letter to Mistress Clarence," I answered. "I was going to get it when I was stabbed, you remember, and afterwards we forgot all about it. Now it is too late. It has been left behind."

She did not answer then, but came out to me, and turned with me to look at the horses. "This comes of your foolish scruples, Master Francis!" she said severely. "Where was it?"

"I slipped it between the leathers of the old haversack you gave me," I answered, "which I used to have for a pillow. Van Tree brought my things down, but overlooked the haversack, I suppose. At any rate, it is not here."

"Well, it is no good crying over spilt milk," she said.

She called the others out then, and there was no mistaking Mistress Anne's pleasure at escaping the Santon road. She was radiant, and vouchsafed me a very pretty glance of thanks, in which her relief as well as her gratitude shone clearly. By half-past four we had got, wearied as we were, to horse, and with three hours of daylight before us hoped to reach Wesel without mishap. But for most of us the start was saddened by the parting—though we hoped it would be only for a time—from our Dutch friends. We remembered how good and staunch they had been to us. We feared—though Master Lindstrom would not hear of it—that we had brought misfortune upon them, and neither the Duchess's brave eyes nor Dymphna's blue ones were free from tears as they embraced. I wrung Van Tree's hand as if I had known him for months instead of days, for a common danger is a wondrous knitter of hearts; and he only smiled—though Dymphna blushed—when I kissed her cheek. A few broken words, a last cry of farewell, and we four, with our two guides behind us, moved down the Wesel road, the last I heard of our good friends being Master Lindstrom's charge, shouted after us, "to beware of the water if it was out!"

## THE CENSUS AND SOME OF ITS LESSONS

BY THE REV. PREBENDARY HARRY JONES, M.A.

WHEN the first Christian census was taken the whole of Christendom met in a room, and the chronicler of the Acts of the Apostles reckoned it up in a glance. There was more pressing business in hand. Nevertheless he set down the result of his rapid summary. "The number of the names together was about one hundred and twenty."

It would interest some curious people to learn what the population of this country was then. One thing we know for certain. There was not a single Christian within its four seas. Now, though, happily, a so-called "religious" census is not to be taken, we are thankful that of those that were presently "added to the Church" not a few are to be found within the islands in which we live. How many we cannot tell, and no "telling" would inform us.

Nevertheless the business which comes round this month is full of both interest and valuable information. It not merely entertains the inquisitive, but sets gravely suggestive lessons before the most thoughtful. We are bidden to "number" ourselves, and in due time shall learn, with whatever satisfaction or otherwise follows the discovery, how many we be. Busy brains and fingers will count, sort, and tabulate the contents of the papers with which each "household" has been provided, and compile as near a record as may be of the "homeless" in this Christian land.

Let us pass in review some of the thoughts, commonplace enough, which are aroused at the taking of a census. We are not really counted, but number ourselves, at once, with one short exercise of inquiry and act of inscription. The work of the enumerators, barring such assistance as is given to the ignorant (which with the growth of schools grows less at each recurring decade of years), is properly only to collect and arrange the information with which they are supplied.

Hence we may, to some extent, realise the presence of what is called civilisation. When Joab went through the tribes of Israel from Dan even to Beer-sheba that he might number the people, he, and the captains of the host who were with him, spent nine months and twenty days about their business. They would appear to have gone from city to city, and village to village, counting heads. It was simply an itinerating addition sum which they worked. Nor did they profess perfect exactness, for they brought out the total in round numbers—so many hundred thousand. Moreover, it is most notable that they were "military" scrutineers alone. No notice was taken of the sick, old, or young; women and children were not counted. When the enumerators came to give in their returns we find that, as it is put in our English Bible, they reckoned only valiant men "who drew the sword."

This may strike us as a strange way of testing the value of those who were called the people of God. In its adoption, however, we are let into the secret of David's fault, who was often too ready to count only weapons and their wearers, and make overmuch of the issue of battle alone. In contrast to this, though the preparation for and classification

of the results supplied in the taking of our census necessarily occupy a considerable time, the process of counting indicates a certain phase of civilisation, inasmuch as it is performed by ourselves, and not by the officials employed. Moreover, it is done in an hour, and really gives only the number of the "unarmed," since that of our fighting men is already known.

In looking at the procedure of April 5, there is thus something to gratify ourselves in the possession of social machinery which can be set to work with simultaneous effect and sufficient accuracy. Even failures in preparing the return required will show fairly enough the proportion of ordinary intelligence possessed by the nation, compared with that exhibited ten years ago. With this is associated a significant test of the elementary education which has been carried on since 1881. The printed forms supplied are, so to speak, national examination papers in reading and writing.

The nature of the information they supply, moreover, brings home to us, in comparison with the military census of David, the fact that we are an "industrious" people. In this country work, not war, occupies its inhabitants. This is, so far, a wholesome thought. The inquiry which is made recognises the value of those who cannot draw the sword, and sees an important significance in the total even of the sick amongst us. This last tells us something about the advancing knowledge of sanitary laws. The main purpose, however, of our reckoning is to ascertain our numbers and business. There is here no slight significance in the contrast between the numbering of the people by David and that which takes place amongst ourselves.

Let us use another scriptural comparison afforded by the difference to which I have alluded between the first given total of Christ's followers, and that to which it may amount now. At the beginning of our era, when there went out a decree from Cæsar Augustus that all the world should be taxed, the first thing that strikes us is that (however ambitious and comprehensive the order) the new-born babe at Bethlehem would not have been considered worth counting by the Roman enumerators. Here, in passing, let me remark that we have an indirect hint about the value of a "religious" census. As it was with the Son of Man, so, in their measure, is it with the sons of men. There are ever those amongst us whom we know not. The mere official eye misses, cannot indeed take account of, a presence and a power which incalculably affect the wisest and most pretentious official returns. Passing by, however, the assumption that the child Jesus found no place in the census of Cæsar, though presently the king was troubled at His birth, we find that thirty years later, after His death, when the first reckoning of His followers was made, the number was only about one hundred and twenty.

A small total. And yet it was the most valuable and effective band whose sum has ever been given. What a handful it was by the side of the great heap of the world! And yet what a change it has been the instrument of making! It is a change, indeed, incalculably short of completion; for this little leaven is far from having leavened the lump in which it was put. The influence, however, of which these one hundred and twenty became the first vehicle, has never ceased to work, showing itself in divers ways, finding new channels, taking fresh shapes, but ever, where its stream is purest, promoting the love of truth, self-sacrifice, humanity, compassion, and bringing great and endless comfort to an innumerable multitude of souls.

Whatever good has, or will, come through Christianity, began to come through these one hundred and twenty. They were the leaders in the spread of that slow but progressive regeneration of mankind which is the desire and work of the Christ. Herein this earliest census might teach us something about the value of "numbers." It is counted a great thing for nations when they can reckon their people by millions. Some see incontestably flattering prospects in a sheer increase of population, but the value of a multitude of souls must needs depend upon the individual worth of those who compose it. A crowd of fools is nothing to boast of. I am afraid, however, that the tendency of to-day is to worship "numbers." People please themselves by counting heads, without knowing what is inside them.

This is obviously the case in politics and society, and unhappily, we may add, sometimes in religion. I will not dwell over the political aspect of this fact. We are under government by Party, and whatever may be said for this, it cannot be denied that measures are carried by numbers, and that equal weight is given to the votes of the foolish and the wise. If we look at what is called "society," we see it stirred by waves of fashion, capricious as they are manifold, which affect every aspect of life and carry crowds with them; the greater part not knowing why they are moved at all. If so many can be led to agree in a project or course, those who adopt it conclude that it must be right. General acceptance is supposed to insure us against error, whereas we forget that the whole world may be mistaken, and that up to any present point (and no one can go beyond that) universal assent may be given to an error, as when it had been believed through all known time, everywhere, and by all, that the sun moved round the earth, and not the earth round the sun.

Anyhow, fashions are followed, and opinions are held, by droves which crowd on like sheep when the wayward leader has once made or found a gap in the hedge, and so far as we do this I do not see what comfort there is in discovering that there are more likely to do it now than there were ten years ago; more to follow at the heels of the plausible, more to catch up the whims of fashion, more to exhibit on a larger scale the mischief of merely following a multitude.

The worst of it is that this infection of nature is found, yea even in the regenerate, and that we are tempted to measure the value of a religious statement or creed by the number of those who accept or profess it, and the stubbornness with which they maintain their belief. Some forget that such a test would give embarrassing ascendency to the claims of the Mahomedan and Buddhist. We may indeed be thankful when we see an increasing number ready to be taught intelligently, but what

we want is the spirit of willingness to learn facts, and more about them, rather than to hold some view or opinion which has been found acceptable by the "majority." Real Christianity has advanced, not by the following of crowds, but through that individual perception of the mind and work of Christ whereby living stone after stone has been added to the temple of God. There have, no doubt, been outpourings of the Spirit, and bursts of adhesion to the visible Church: meanwhile the true apprehension and growth of the kingdom of heaven has ever been personal and gradual, and cannot be tested by numbers. The crowds who first followed John and then Jesus Himself, were the mere semblance of success. John was left in prison, and presently all the disciples of Jesus forsook Him and fled. The height of the first reaction in His favour, the Roll Call after the Battle of Calvary, showed the names of some hundred and twenty instead of the thousands who had followed Jesus in the way. And this sifting has ever since gone on. The occasional multitude has been disintegrated and weeded, sometimes wholly dispersed. We might learn some lessons concerning the value of numbers when we think about the teaching of a census.

Another comes as we remember that our enumerators desire to know not merely the names and ages of the whole household, but the business, place, trade, calling, or profession, of each. Those who are not quite young children and have no distinct employment may appear as students, scholars, or apprentices. It is desired, in short, that we should know what every one's vocation is.

And under this head will appear a number who have nothing to do. It is not that they will be set down as "unemployed," for a carpenter who is out of work will nevertheless make mention of his craft. A large proportion of the unoccupied who give their names and ages alone will consist of unmarried women who are not compelled to earn their bread, and who nevertheless have received what is called a superior education, though sometimes this does not fit them to manage a household with intelligent and instructed economy, teach their children well if they should be married and have families, or procure a living for themselves if necessity should arise. This will lay bare a stratum in society which reveals a suggestive feature of our modern insular life, and set some to ask whether female education in England, and the potential state of all women among us, does not need further improvement. Many "men," too, who are assumed to have been well taught at our universities and elsewhere, and who are, in the census papers, forbidden (with unconscious irony) to describe themselves as "gentlemen," will be required to state that they are of "no occupation." Without doubt this column will contain the names of such as are presently about to become responsible for duties which admit of no definition, but are as exacting as those of any recognised profession. Nevertheless, after due allowance has been made for these exceptions, and for those who (though without a specified calling) employ their leisure in doing unpaid work for the good of their fellows, there will be too many compelled to set themselves down as virtually idlers.

One use of this questionable forecast in our returns might be well suggested if each were to ask himself or herself, "What am I doing? I am put here for some purpose beside my own amusement and the agreeable killing of time. How am I filling my place in my family, circle, society, world?" If there could be a printed list of those who are usefully employed and discharging the inevitable duties of life well, should I be found in it? And if those in this list were entered according to merit, where should I appear?

This leads to a still larger and more august inquiry. The Bible, especially that part of it which we know by the name of Gospel or good news, has some grave hints and striking pictures of a close and comprehensive scrutiny ever being made and approaching completeness. Jesus Himself said much about stewardship, a rendering according to talents or pounds received, profitable and unprofitable servants, final divisions and separations when the great net is emptied and the worthless thrown away, or nations paraded for individual inspection and retributive discernment. It is no wonder that we find the first commentators on gospel revelation, such as St. Paul, writing down that all must receive the things done in the body, each "according to that he hath done, whether it be good or bad;" and that every one of us shall "give account" of himself to God. So it is. We are always filling in our own paper for the great Enumerator. The leaves of the Book of Judgment are the returns of the individual conscience, and we need wander into no speculations about a future day of Doom in order to be sure that the testimony of this goes to make up the great census of right and wrong, and to bring sadness or joy of heart.

This is probably the chief instructive use which will be made by Christians of the present numbering of the people, and we must not put it aside because it is obvious. We are all called to render some account of ourselves. What is the true and full one, such as each of us alone can give?

Another thought, suggested by the written returns now required, arises from the fact that they are "comparative." In this indeed our main interest is aroused. We already have the census which was taken ten years ago. What changes will this one reveal? What mood of dissatisfaction with widespread country life and work will be shown by the shrinkage of old villages and the growth of new towns, or fresh additions to the fringe of our already overgrown metropolis? There are materials for serious thought in the social transformation of which we are thus reminded. The old order changes in many ways, giving place to new. What shiftings in the demand for articles which have been formerly used will be displayed? What increase in the means of locomotion and intercourse will be indicated? What novel crafts will make their appearance, what others disappear? What sign of growth in letter writing and literary productions will be seen in a greater number of paper makers, authors, and editors?

These and such like interesting speculations will

presently find an answer in the summary of the returns that are made. But the thoughts of many may well be most deeply stirred as they realise with importunate distinctness that they are ten years older than they were when they last filled in the blank columns of a census sheet. Time marches on with steady strides. The unit disappears from corporate life. The regiment remains, though all in turn drop out of its ranks. A thousand grey old churches stand through winter winds and summer heats, while new men minister within their walls, fresh voices sing the familiar hymns or say the old prayers, and other ears hear the ancient word of the Lord. The "nation" has lived long, and keeps its stubborn life while the individuals in the national procession move quickly into and out of sight. How many who wrote their names ten years ago have now laid aside their pens? How many of us will sit down to fill up the census paper in the year 1901? Some have come and gone without ever finding place in a return of the living—a touching thought, considering how precious they may have been to those who rejoiced in their arrival and short life. Some are now counted for the first time. As for the rest of us, who have already been reckoned, it is a tame inadequate thing to say merely that we are ten years older than we were in 1881. In that time some have begun to feel that bodily and mental change which marks the passage from childhood into the passions and the thoughts of maturity, though they may not yet be what is called "of age." Are they realising that more is required of them in self-control and responsibility towards the older world which they have already entered, or on the threshold of which at least they stand?

Others have taken the chief steps which determine life. Their trade or profession has been chosen. Perhaps they have been married. Their place has been fixed. But as they look back over the irrevocable years, they might do worse than ask themselves how far they share the blame (if there be any) for such failure in contentment or progress as may have been felt. Are they making the best of the positions, pursuits, and relationships which have been settled for them? It is possible to obtain unexpectedly good results from unpromising material if only we look within, rather than without, for encouragement.

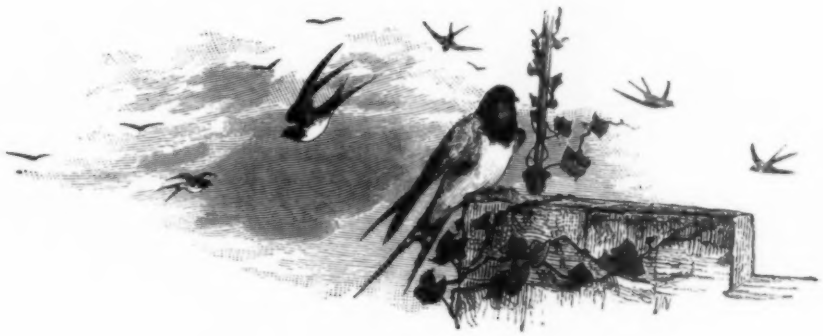
In contemplating the succession of the decades at which the people are numbered there is another thought we might well lay to heart. Some who have been counted several times are apt to consider themselves older than they are, and to talk as if the time has passed for them to indulge in aspirations. This is wrong. As we realise and use our kinship with God we defy the dulness of age. A time may come when the earthly house of this tabernacle is being consciously dissolved, and a veil descends upon all mortal concerns and powers of observation. But meanwhile the mere passage of years has no business to shrink our true vitality, or lessen what is called our "interest in life." Those who talk about their "disillusions" while they are yet in the midst of their course, will possibly some day look back upon the period through which they are now passing, and see it really as full of opportunity as youth appears to the despondent among the middle-aged. We must not be misled by conventional sentences, not even by the most weighty and distinguished. The "days of man" may be "as grass," which "withereth and fadeth away," but we might remember that the grass meadow gives a more permanently abiding growth than that of the wheatfield, and that the seed of the clover lasts as long as, or longer than, that of the most enduring corn.

It is well indeed to live in a state of readiness for departure, but we do that (without incessantly thinking of death) when we are honestly doing our work with trust in the living God, and His laws—bodily, moral, and spiritual. Few habits are more depressing than one of dwelling on the shortness of life and the inutility of human purpose. There is no limit to the power of the righteously confident. "All things," said Jesus (in one of those sayings which have incalculable applications) "are possible to him that believeth." Let that be a lesson to some who are tempted to shorten sail before their time, being impressed by the recurrence of a census, and compelled to realise that they are markedly older than they were.

Moreover, any prolonged reflection on the brevity of human days is apt to make our work superficial. Every so-called mortal should labour for immortality; doing what he has to do on the lines of the Great Worker, the eternal God. Life is real. This life is earnest. It is not an overture before the play begins, but the first act of the drama. It is no preliminary period, in which we may be content to live from hand to mouth. Even in the doing of his passing duties a man may not discharge them as if he were merely filling up a gap in a wall which was soon to be thrown down. They form part of a connected whole, and are virtually in union with the great laws of life and growth. To work thus is to labour "in the Lord," and this labouring is not in vain. Let us lay this to heart, though the census day may have come again and again.

There are some, indeed, whom it takes almost by surprise, their road has been so flat and straight; for the speed of life grows when we reach its levels. Still, the laws of living hold in their case, and they might yet sometimes ask themselves what wholesome resolution made ten years ago remains unfulfilled.

What shall I say of the unquestionably old who cannot expect to be counted again? The procession will be marching on, but their place in it will know them no more. The arrival of the census date should make them very thoughtful and silent. The sun is low, and must set soon. It is not a question of possible sickness or accident which may cut the thread of life. The inevitable shears which sever it are open now. I do not ask the conventional question whether they have made their "peace with God," as if He were an enemy to be feared unless we had made terms for an undisturbed settlement in the land where we would be. That is secured, and if we will believe and accept it, we shall rejoice.



Perfect love casteth out fear. We have an immeasurable assurance in the words, "there is

now no condemnation for them that are in Christ Jesus." That is a saving faith.

And yet, with some, the statement of it seems to belong to the world of religious or ecclesiastical sayings, and sounds more or less unreal. But the "reality" of departure is at hand. They are like people on the quay waiting for embarkation on a voyage to a land from which there is no return. The signal to sail will soon be given, and they must be gone, with perhaps some hasty last farewells, after which our friends who stand to see us go will walk away.

What shall these do, these who wait upon the shore? Do? While we "live" we are called to do our work on the lines of righteousness, not expediency, in union with Him who came not to do His own will, but the will of Him that sent Him; and when the task of life is dropping from our hands, there is nothing to be done better than to keep the book of our lives open before our Father's eyes, holding nothing back, covering nothing over, claiming no selfish dues, and simply saying, "Father, into Thy hands I commend my spirit."

That is, truly, a mood which is ever needed, but when we realise a time of reckoning, it might well come home closer to us, and be gladly welcomed, even in this month of the census, with special fitness and blessing to our souls.

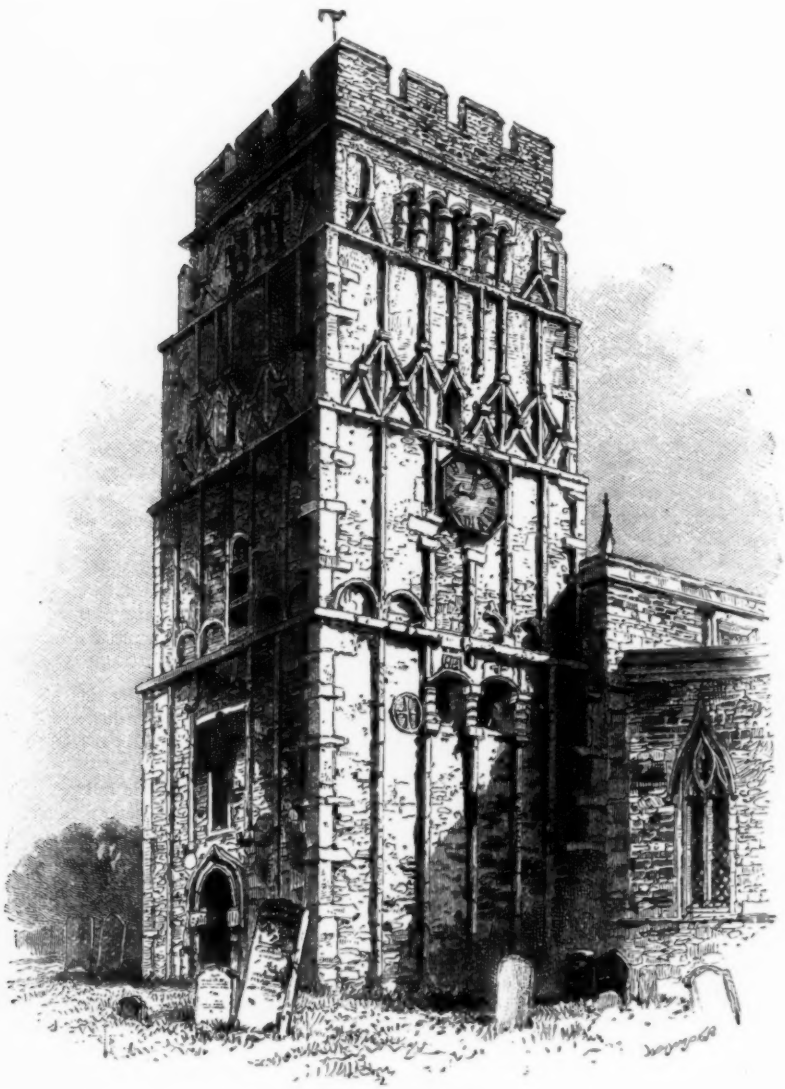
## The Swallow's Song.

*From the French.*

I've seen! I've seen!
(The swallow cries.)
"What have you seen
'Neath Spring's cold skies?"
The children in the fields at play,
The flowers coming up this way,
The gay green things, more green each day,
I've seen! I've seen!

I've seen! I've seen!
(The swallow said.)
"What have you seen?
Last year is dead,
And clouds are driving overhead."
I've seen the birdies line their nests
With yellow catkins' silken crests,
And warm their dear eggs 'neath their breasts.
I've seen! I've seen!

I've seen! I've seen!
(Comes twitteringly.)
"What have you seen?
*I* cannot see."
The deserts where tall palm-trees rise,
The wide blue water; and the skies
Where warmth of summer ever lies;
I've seen! I've seen!



I've seen! I've seen!
"Oh, glad true song!
I've nothing seen
My whole life long.
A child I've been with blinded eyes;
Teach me, O birdie, to be wise;
To know that after cold and rain,
The sweet green gladness comes again,
And even during winter's reign
Love's law is strong."

CRONA TEMPLE.

# THE STORY OF THE ENGLISH SHIRES.

BY THE REV CANON CREIGHTON, BISHOP DESIGNATE OF PETERBOROUGH.

## NORTHAMPTON.

EARL'S BARTON TOWER.

IN early times the rich meadows of Northamptonshire were covered with brushwood, and the whole district was a tract of inaccessible upland rising above the sluggish waters of the Wash. Its two extremities were traversed by roads of communication which the Romans raised. On the eastern side, the Ermine Street coasted by the side of the Wash, and crossed the narrow strip between the valleys of the Nen and the Welland. In the Nen valley, the experienced eye of the Roman found clay which was suited for making pottery, and the station of Castor became the seat of an industry whence blue and grey earthenware were exported to various parts of Britain. Similarly, on the western side, the

Roman road of Watling Street traversed the district on its way to Chester, and the Romans left the marks of their presence in the name of their station on the river Tow, now called Towcester. Between these lines of communication lay the forests of Holdenby, Rockingham, and Yardley Chase, which were scarcely inviting to the Roman colonist.

When the English invaders began to make their settlements, the upland that rose above the Wash was exposed to the invasion of the Gyrwas who sought a home along its inhospitable shore. Another body of English who had mounted the valley of the Soar, sent out an offshoot who made their way along the Watling Street to the valley of the Nen. There, on a spot where the ground was somewhat cleared, they set up the "home town" of their tribe, which in later days was called Northampton to distinguish it from the other Hampton on the Solent. Thence they pushed their settlements along the valley of the Nen till they reached the land occupied by the Gyrwas on the coast.

These little tribes were soon absorbed into the great Mercian kingdom. The great warrior king of Mercia, Penda, was a heathen, but on his death, in 655, his sons embraced Christianity, and showed their piety by founding on a tract of meadow-land, which rose above the neighbouring fen, the abbey of Medeshamstead, on which they conferred large domains. The Abbey, which was dedicated to St. Peter, afterwards changed its name to Peterborough, and with its neighbours of Crowland, Thorney, and Ramsey, was the great means of introducing agriculture into this waste district. Hard by, at Barnack, was a quarry of excellent stone, which had been worked by the Romans. This the monks soon learned to use for their own buildings, and it is this fact which has given to Northampton its chief distinction amongst English shires. Nowhere in England are so many stately churches to be found as along the valley of the Nen. The monks gave the impulse to church building; the stone was near at hand; and carriage by water was comparatively easy.

But it was long before church building on any large scale was possible to the little settlements along the Nen, though the example of Medeshamstead soon led to the formation of other monastic houses along its banks. Bishop Wilfrid founded a monastery at Oundle, where, in 709, he finished his adventurous career. Round the monasteries there was a slow growth of agricultural life and prosperity, which in the ninth century was checked by the horrors of the Danish invasion. Then it was the wealth of the monasteries which marked them out as the prey of the heathen plunderers. At the end of 869, a Danish army marched from York, burned down Medeshamstead and slew all the monks. The eastern district was again reduced to a waste, but on the western side the Danes occupied Northampton and planted settlements in the lands which lay around it.

When the West Saxon King Edward undertook the recovery of central England from the Danes, he began a series of campaigns in which he slowly drove them northwards. In 919 he was master of the valley of the Ouse. He next seized and fortified the site of the old Roman station at Towcester. The Danes of Northampton summoned their brethren to drive out the invader, but they were beaten back from the palisade which protected it till Edward secured his new town by building a wall of stone. Then he advanced against Northampton, which surrendered in 921. It was after this recovery that the Mercian kingdom disappeared and its lands were divided into shires. The country round Northampton, corresponding to the old settlements along the Nen, was made into a shire by itself, and strove to bring back its old life as it was before the Danish invasion overthrew it.

The sign of this restoration was the revival of the abbey of Medeshamstead after it had lain desolate for a hundred years. Ethelwold, Bishop of Winchester, was a great promoter of monasticism, and begged of King Edgar that he would give him all the minsters which the heathen had destroyed. At Medeshamstead he found only ruined walls and wild woods, but he obtained from the king a grant of lands "to Christ and to St. Peter," and the revived abbey took the name of Peterborough. We can still see the influence of this revival in the architecture of the churches of Brixworth, Brigstock, Earls Barton, Barnack and Whittering, which can all show work that dates before the Norman Conquest.

In the days of Edward the Confessor Northamptonshire, together with the neighbouring county of Huntingdon, were given to the earldom of Northumberland, but were soon separated and conferred on Waltheof, the last great Englishman under William the Conqueror. Waltheof died on the scaffold, and his daughter married a follower of William and Simon of Senlis, who became Earl of Northampton, where he built a castle and founded the convent of St. Andrew in the town.

This shows one way in which the Norman occupation of England was carried out. The fortunes of the abbey of Peterborough show no less clearly how William the Conqueror employed the power of the Church to secure his hold of England. In 1069 he set a new abbot in Peterborough, Turold, a Frenchman, chosen for his military skill. The rebellious English of the east, aided by the Danes, hearing of Turold's coming, attacked Peterborough under the leadership of Hereward. They sacked and burned the monastery, and dispersed the monks, so that Abbot Turold, when he arrived with his troops, found only one man left sick in the infirmary. Turold fortified his monastery by building a castle, and led a life of much quarrelling with his monks. Other misfortunes soon befel the abbey. The church, the monastery, and all the town caught fire and were burned down in 1116, and to the rebuilding, which was then undertaken, is due the massive Norman architecture which distinguishes the Cathedral Church.

In the northern part of the shire was built the royal castle of Rockingham, on the brow of the hill which rises above the valley of the Welland; behind it stretched the dense woodland of the great forest which sloped towards the Nen. In the reign of William Rufus Rockingham Castle was the scene of one of the most notable events of English history.

William II carried to its furthest point the royal power, and used it to gather money from every source. He disdained restraint, especially that of religion and morality, and on the death of Archbishop Lanfranc refused to nominate another archbishop in his place. For five years the English Church was without a primate, and William took to himself the revenues of the vacant sees. At length a serious illness brought him to death's door, and he was urged to make reparation for his ill-doings by making an archbishop.

ELEANOR CROSS, NORTHAMPTON.

Anselm, abbot of Bec in Normandy, famous alike for learning and piety, was then in England, and the nobles urged him upon the king. Sorely against Anselm's will the office was thrust upon him, for he was a quiet man who did not wish to struggle against the violence of the king. When William recovered from his illness he wished to be rid of Anselm, and sought every means of annoying him. At last he charged him with disloyalty and summoned a Council at Rockingham. Anselm was deserted by the other bishops through fear of the king, and at last appealed to the Pope as the only power which could place a check upon the tyrannous use of the royal power. It was in this way that the custom of appealing to the Pope grew up. In an age of lawlessness and violence it was thought necessary that there should be some appeal to the public opinion of Europe, which only the Pope could express. There was no other way to curb a king who threatened to crush men's liberties by force. Anselm was fighting single-handed for the cause of righteousness and order.

But the appeal to Rome against royal decisions was a custom which might work well or ill, and was by no means to be trusted. Its dangers were shown when Archbishop Thomas Becket upheld against Henry II's wise legislation the exclusive privileges of the clergy to be tried only in ecclesiastical courts. If the Council of Rockingham showed the power of the Church to oppose tyranny, the Council of Northampton showed how it might interfere to prevent useful reforms. There Archbishop Thomas appeared, carrying his own cross, in sign that he

expected a personal attack to be made upon him. "A fool he always was, and always will be" was the remark of the Bishop of London on seeing this needless striving after dramatic effect. The archbishop appealed from the king to the Pope, and solaced himself under the disapproval of his peers by the acclamations of the people gathered outside the castle. He made his bed in the Church of St. Andrew, but in the night fled away, and escaped abroad, where he spent six years in exile and only returned to England to meet a violent death.

These were episodes in the history of the shire, which continued to prosper. In 1184, the line of its earls of the family of Senlis came to an end, and the earldom was not renewed. The position of Northampton on the great road of Watling Street made it important, and it still keeps a memorial of its importance in the cross which Edward I erected over the resting place of the body of his queen, Eleanor, when it was borne from Lincoln to London for burial. It was this central position that gave Northampton its trade of shoemaking, which is of very long standing. The town was well situated as a centre for distribution of an article which was universally needed, and hides could easily be obtained from the rich grazing meadows which surrounded the town on every side. It was an old saying that "Northampton stood on other men's legs."

The same cause seemed likely for a time to give Northampton another claim to fame. In 1260, there was a quarrel between the University of Oxford and the town, which led to a secession of the students, many of whom fixed on Northampton as their new abode. But it was not thought well in those days that seats of learning should be multiplied. The king interposed to heal the quarrel at Oxford, and the students were bidden to return thither. The infant university of Northampton was rudely crushed. There were political

motives also in this suppression, for in the stormy days of Henry III the students of Oxford were eager for reform and sided with the barons in opposing the king. Northampton Castle was held by Simon de Montfort, and was attacked and taken, in 1264, by Henry III. The king gained entrance into the town by the help of the prior of St. Andrew's, whose convent garden joined the town walls, which the monks secretly undermined, supporting it by wooden props.

Like other midland counties Northampton did not take a conspicuous part in the history of England during the middle ages. Its people were mainly employed in agriculture, and in the gradual clearing of the ground which spread northwards from the valley of the Nen, a process which can be gradually traced by the dates revealed by a study of the architecture of the parish churches. At the beginning of the fifteenth century Edmund of Langley, Duke of York, founded a collegiate church at Fotheringhay, where he rebuilt the castle. His grandson, Richard, claimed the crown of England against Henry VI, and so caused the Wars of the Roses, which laid England waste and destroyed the old nobility. In 1460, Henry VI was defeated and made prisoner by the Earl of Warwick in a bloody battle fought just outside the walls of Northampton, and the capture of the king led to the assertion of the Duke of York's right to the English crown. York's triumph was short, for next year he fell at Wakefield. Fotheringhay was made the burial place of the Yorkist line, and Edward IV there celebrated the obsequies of his ancestors and made the castle his headquarters against his northern foes.

The restoration of peace by the Tudors was the beginning of the making of a new England. Few counties show more traces of this process than does Northampton. The grave of the luckless Katharine of Aragon in Peterborough Cathedral tells how Henry VIII condemned his discarded wife to lead a life of solitude and neglect at Kimbolton, whence she was carried for burial to the nearest abbey. The bones of Katharine were the last relics which the monks of Peterborough were to receive. The great abbey was dissolved, its treasures went to the king's coffers, its buildings were handed over to the destroyer. Yet Peterborough was lucky above most of its neighbours; and Northamptonshire was one of the few counties which could boast that at least a portion of the monastic plunder had been converted to the public good. The abbey church was spared that it might become a cathedral, and the two shires of Leicester and Northampton were cut off from the unwieldy diocese of Lincoln, and received a bishop of their own. It is, however, worth noticing that the last abbot was made the first bishop, apparently without much consideration of fitness, that the king might be spared the expense of granting him a pension.

Still more important was it for the prosperity of the shire that its fair meadows attracted the men who were replacing the old order of the feudal nobles which had been almost swept away in the Wars of the Roses. The new nobility sprang from the class of gentry who served the crown as officials and used the opportunities offered by the social changes which were passing over England to pick up eligible manors and add field to field. The great revolution of the sixteenth century was largely founded on economic causes. The central government had grown powerful enough to rule England without being dependent for help on local magnates. The days of the barons, who were strong through the castles they possessed and the number of retainers whom they could lead into the field, had passed away. The day had come for a new order of nobles who were important through their large estates and long rent-rolls. The feudal lord made way for the landholder, the fortified castle for the stately mansion. So the fertile meadows of Northamptonshire largely passed into the hands of three families which steadily rose in wealth and importance. The Spencers settled at Althorp; the Comptons at Castle Ashby; and Elizabeth's great minister, William Cecil, built in the east of the shire the mighty pile of Burleigh House which is still the greatest architectural memorial of the great aspirations of the Elizabethan age. Perhaps few incidents bring before us more clearly the change which passed over England in the sixteenth century than does a quarrel which broke out in the reign of James I between the Earl of Arundel, who represented faintly the old traditions, and Lord Spencer, who did not shrink from making himself spokesman of the new order. In the House of Lords Spencer appealed to the memories of the past as a motive for present action: "My lord," cried Arundel, "when these things were doing your ancestors were keeping sheep." Spencer's reply was quick: "When my ancestors, as you say, were keeping sheep, your ancestors were plotting treason."

However, Northamptonshire was not left so peaceably under the care of her new landlords as not to be reminded of the dangers through which England passed before she could ensure her new prosperity. Fotheringhay Castle, lying as it did among the lands of men bound by their own interest to support Elizabeth's throne, was chosen as a secure place for Mary Stuart's trial and execution. Burleigh drew out with his own hand a plan of the arrangements of the hall for that memorable trial. By the fireplace in the hall the scaffold was erected on which Mary met her doom, and her body was buried in Peterborough Cathedral by the side of that other ill-fated queen, Katharine of Aragon. There it reposed till James I transferred his mother's remains to the royal burying-place at Westminster. Fotheringhay Castle was allowed to fall into ruins, and nothing save the mound, below which flow the waters of the Nen amid its peaceful meadows, is left as a memorial of the saddest tragedy in England's history.

In the Great Civil War Northamptonshire was the scene of the memorable battle of Naseby which at once overthrew the cause of Charles I and established the military greatness of Cromwell. Charles, who had taken Leicester in 1645, was marching thence westward, when news was brought that the Roundheads under Fairfax were advancing to meet him. He took up a strong position near Market Harborough, while Fairfax occupied the rising ground near Naseby. The impetuosity of the Cavaliers moved Charles to leave his vantage ground

and attack. The same impetuosity led Prince Rupert to neglect military prudence and pursue the enemy whom he routed, while Cromwell used the opportunity to fall upon the rear of the body commanded by the King. The Royalist losses were great and Cromwell's victory was complete. Charles took refuge with the Scots only to be sold to the Parliament, by whom he was permitted to live in peace in his house at Holdenby, a little north of Northampton, a house which had been built by Elizabeth's favourite, Sir Christopher Hatton. However, Parliament was no longer supreme in England, and the management of affairs had passed into the hands of the army.

One day at Holdenby Cornet Joyce, with his hat on his head and a pistol in hand, broke into Charles's bedroom and ordered him to prepare for a journey. "Whither?" asked the King, and was answered "To the army." "By what authority do you come?" Joyce pointed to his pistol and answered "By this! Make haste." Charles could not hide from himself that it was the beginning of the end.

This is the last picturesque episode which the annals of Northamptonshire have to record. We need not regret the quiet days which followed, when daily toil and steady industry took the place of battles and executions. The growth of agriculture and the development of industry is a gradual process wrought out with as much heroism as are the exploits of a soldier in the battlefield; but the heroism which it demands is daily and constant, and rarely admits of relation. We may be content that in the eighteenth century political questions were settled by elections rather than by civil wars, and that great families fought for political influence by the less heroic means of bribing constituencies. Of this warfare of the eighteenth century, Northampton was a conspicuous instance. In 1768 especially there was a triangular duel between Lord Northampton, Lord Halifax, and Lord Spencer, which should have the honour of nominating the member for Northampton. The electors were entertained free of expense. When they had drunk all the champagne at Althorp and were served with claret, they rejected the "sour stuff," and removed to Castle Ashby to try the cellars there. The poll showed the remarkable result that, though there were only 930 electors, 1,149 votes had been recorded. A petition naturally followed, and the struggle was renewed on a larger scale before a parliamentary committee, with the result that the question was finally decided by tossing up. It is said that the election cost each of the noblemen who were engaged in it, considerably over 100,000*l.*

Those days also have passed away. At present the traveller in Northamptonshire is chiefly reminded of the continuous care by which modern England has been created. The smiling meadows with their flocks and herds, the ancient villages which nestle round their beautiful churches, the stately mansions of which the shire is proud, make it one of the most interesting of English counties.

OLD HOUSE AT NASEBY.

# WINTER RAMBLES IN SEARCH OF MICROSCOPIC LIFE.

BY W. H. SHRUBSOLE, F.G.S.

## MORE MARVELS IN MUD.

THE pretty little objects crowded together in the illuminated disc on the microscope stage (see "L. H." p. 247), and moving independently to and fro, as if without aim or object, are diatoms belonging to a genus different from those previously introduced in these "Rambles." These, like all other diatoms, are true plants, inasmuch as they have the capacity to appropriate carbon and to eliminate oxygen; and inspection by suitable means makes it evident that they, like many other unicellular organisms, are able within a limited range to exercise locomotive power.

The reader will probably remember that—as described on page 531 of "L. H." for Aug. 1889—a diatom is a very minute plant consisting of but a single cell, the walls of which are built up of flint in the form of delicate plates, which, when viewed microscopically, are objects of great beauty.

These now under examination were intermingled with the mud in the bottle, and it almost seems as if they were inspired by laudable ambition to rise in the world. At all events, under solar influence, they did elevate themselves a few inches in direct opposition to the force of gravity.

Advantage is taken of this heliotropic faculty to get diatoms free from earthy admixture. An experiment in separation can be tried with the material in one of our soup-plates. As this has been standing undisturbed for some hours, the solid particles have subsided, leaving the water above clear and distinct. We now remove the fluid with a syringe and expose the sediment. Its surface is overspread with a dark brown film, which, by its intensity, indicates to an experienced eye the richness of the gathering. With a soft flat varnish brush it is quite easy to lift most of the film by degrees, without disturbing the mud, and by washing the brush in water after each application we get the diatoms by themselves ready for further treatment.

Since diatoms, whilst living, readily respond to the stimulus of light, it is possible to produce a novel kind of photograph by arranging a plate of glass upon some diatomaceous mud, and then shutting off the light in places by means of any loose opaque material. The pattern of a piece of lace can thus be reproduced, as on removing the fabric from the glass the brownish hue of the diatoms will only be visible where light has exercised its subtle influence, while the variations in actinic intensity secure artistic effects in well-marked light and shade.

Nothing is yet known, positively, as to the physical means of diatomic progression. Certainly no appendages or parts that could subserve locomotion have yet been seen, although Ehrenberg thought that he saw a protruded foot; and other observers, using the less perfect instruments of bygone days, imagined that they perceived flagellate hairs, or cilia, such as are common to many minute animals, and that they could thus account for the phenomenon. A diatom in motion is still almost as great a mystery as would be a ship unprovided with sails, paddles, or other means of propulsion, becalmed on a currentless lake, and yet continually moving a short distance, first in one direction and then in another.

A reasonable hypothesis that does not clash with observed facts is, that in order to obtain from the water the silica necessary to the building up of the cell framework, each diatom, by endosmotic action,[1] imbibes the surrounding fluid in sufficient quantity for the purpose.

Prof. Bischoff has lately asserted that diatoms must take into their interior, in order to form their valves, the same quantity of water in proportion to their mass as would be swallowed by a man who drank a cubic foot a second.

It is obvious that the alternate absorption and expulsion which, on this supposition, takes place, must tend to produce the characteristic to-and-fro movements, and also to create feeble currents in the water. That these currents do exist I have no doubt, having repeatedly seen particles of débris swept along the surface of a diatom in the direction opposite to that in which it was, or had been, moving.

This current motion can be made distinctly noticeable by surrounding living diatoms, of certain species, under the microscope with indigo in solution, as was first pointed out by Prof. H. L. Smith, of Hobart College, New York, to whom microscopists are greatly indebted for much valuable information in connection with this subject.

From the foregoing considerations we may conclude that these to-and-fro movements, consequent to a vital process, combined with the light-seeking tendency, enable the little plants to separate themselves from non-living matter, and to mount upward in the jar or other vessel in which the semi-fluid mud containing them may be placed.

The preparation and mounting of diatoms for the cabinet must be passed over as being outside the scope of this article, and therefore we now proceed to examine some specimens taken from the film in the jar on the window-ledge, both before and after they have been through these preliminary processes, which, among other things,

[1] Endosmose is the transmission of fluids through a porous substance, from without inwards.

cause each cell or frustule to separate into its constituent parts—*i.e.* the two plates, generally known as valves, and the delicate band by which they were united. Here, to begin with, is an example of *Pleurosigma angulatum* (Fig. 1). This generic name was doubtless suggested by the

FIG 1.—PLEUROSIGMA ANGULATUM × 200.

longitudinal midrib which extends in a graceful double curve from end to end, and which is a prominent feature of all specimens that have been prepared in the usual way.

Although this diatom is one of the largest of the order, yet it only averages $\frac{1}{120}$ of an inch in length. The sketch represents one face of a living cell with its contents undisturbed, as seen by reflected light with a magnifying power of about 200 diameters.

Now, examine with moderately high power a single valve of a similar cell from which the protoplasm and other soluble matters have been removed. As it is now translucent, its form and structure can be studied to greater advantage by transmitted light. It is seen to be more delicate and beautiful in consequence of the denudation it has experienced, and to present features that

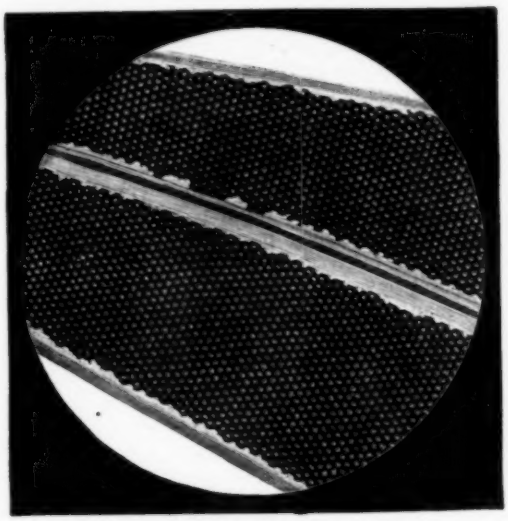


FIG. 2.—PLEUROSIGMA ANGULATUM × 2000.

were before invisible. Very faint parallel lines, closely packed together, as of a fine steel engraving, are seen extending obliquely across its surface; the lines being so densely set that 520 occupy only $\frac{1}{100}$ of an inch! When very high powers are used, a striation in regular order is made much more apparent. To show these striæ distinctly was considered a few years ago as the greatest achievement possible in this direction.

Such progress has since been made, however, in practical optics, that with modern lenses it can be shown that the supposed continuous lines are, in reality, rows of points with intervening depressions hollowed out in the substance of the valve. These appearances are partially masked, and the openings in the central film are covered, during the lifetime of the diatom, by membranous layers; but when the latter are removed by chemical or other process, the hexagonal apertures of this particular form become clearly visible.

These features are well illustrated here by accurate copies of some beautiful photomicrographs executed by several of the most skilful modern diatomists, who have kindly allowed them to be used.

The reader will please bear in mind that the object under consideration is but $\frac{1}{120}$ of an inch long, and $\frac{1}{280}$ of an inch at its greatest breadth,

FIG. 3.—PLEUROSIGMA ANGULATUM × 10000.

and then compare the mental picture with the delineations which follow. The figures appended indicate the degree of diametrical magnification in each case.

To assist the mind in grasping the import of the figures that denote the extent of amplification, it may be remarked that a page of this magazine enlarged 10,000 times would be nearly a mile and a quarter in width.

Let us now gauge the thickness, or rather the thinness, of this valve of *Pleurosigma*. Doing this in the usual manner, we find that the result can only be expressed by a fraction of an inch, whose denominator extends to several figures. Yet, notwithstanding this great tenuity, it has been ascertained, as I have already indicated, that this and other diatom valves are really complex structures built up of several layers!

Further than this, Thomas Comber, Esq., of Parkgate, Chester, has recently accomplished the unique and marvellous feat of splitting a valve into its several films, so as to be able to examine each separately!

Still more recently it has been demonstrated that the ultimate fabric of the diatom valve consists of "fibrils," composed of short bars of silex; but how these inexpressibly minute particles are bound together it is at present impossible to say.

Much more might be said about this particular diatom, but now, for the sake of variety, let us see what has gathered on top of the mud in another of the soup-plates.

NOTE.—Fig. 3 is from a photomicrograph by Dr. Van Heurck, Directeur-Professeur au Jardin Botanique d'Anvers.

When collecting this material I took care not to mix that which was taken from different rills, because in this way various species can be obtained distinct from each other. It fortunately happens so now.

The diatoms felted together in this shallow receptacle turn out on examination to be different from the one species we have been looking at, and

FIG. 4.—SURIRELLA GEMMA × 270.

are known scientifically by the name of *Surirella Gemma*. As shown by Fig. 4, the form is elliptical. The average length of a frustule is $\frac{1}{300}$ of an inch. Its fragile plate is strengthened by a longitudinal bar from which ribs extend transversely to the margin. The surface is decorated with rows of points of such minuteness that there are nearly fifty of them in every $\frac{1}{1000}$ of an inch, and they can only be made visible by the aid of high power

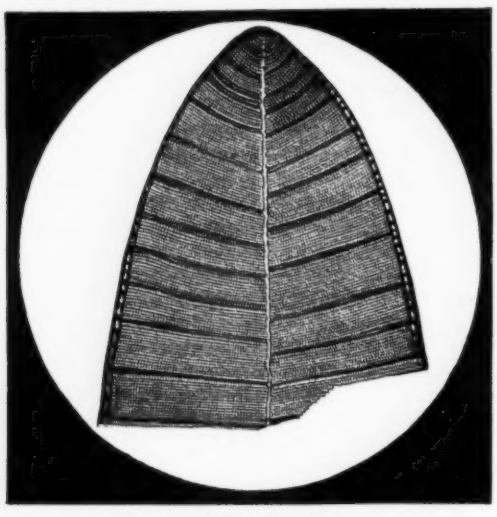

FIG. 5.—SURIRELLA GEMMA × 1000.

lenses in skilful hands. These points are shown in Fig. 5, the subject of which was fractured when pressure was applied to bring its surface into one plane for the purpose of photography.

NOTE.—Fig. 5 is from a photomicrograph by T. Comber, Esq.

Several other kinds of diatoms, either separate or associated, may be found in the saltings all the year round, but those just described are the most prominent forms, and may be regarded as being typical of the whole. The worst time to seek for diatoms in these or similar places is just after heavy rain at the time of low water, for the pelting of the raindrops on the uncovered mud lessens the cohesiveness of the diatoms and leaves them in a condition to be washed away by the next tide. Till I gained this knowledge I occasionally had a lost journey, so far as diatoms were concerned.

Once, on returning from a ramble in the saltings, I had when near home to cross a deep trench that was being cut in connection with drainage operations. The excavation was in the alluvium that fringes the uplands of Sheppey on all sides except the north-east, and marks the former extent of the tidal flow.

The stuff thrown out—a bluish-black silt—was not very attractive in appearance; still, knowing well how rich this old estuarine deposit is in remains of microscopic life, I helped myself to a handful and bargained for a barrowload to be sent to my house. A little further on in the trench relics of higher forms of life had been brought into view. Several undecayed coffins had been unearthed, and where the lids had been broken, complete skeletal remains of humanity were visible. Then it occurred to me that this was the site of the burial-ground for convicts who, in olden times, were confined in hulks close by in Sheerness Harbour, and that Parker, the ringleader of the mutiny at the Nore in 1799—who was hanged at the yard-arm—was interred here.

I also remembered that on Dead Man's Island and on the banks of some of the creeks and gullies running into the Medway it is not an uncommon thing to see coffins projecting out of the soil. These are often collected and used for various purposes by some of the waterside people. I knew one man who in this way obtained in a little while enough firewood for a winter's consumption.

Strange reflections might arise in some minds when sitting by a fire kindled by such material.

Only once in my rambles have I come across any monumental erection. This was a plain headstone standing alone in a wide expanse of desolation on the south side of Stangate Creek, which bore an inscription showing that it was to the memory of a surgeon of the Royal Navy, who died from disease contracted in the discharge of his duty as medical officer of the Quarantine Station, long since abolished. All honour to the memory of this good doctor, whose name is now unknown, for he fell at his post—perhaps from pestilence—bravely doing his duty.

I copied the inscription at the time, but the record has been mislaid. Wishing to quote it here, I sent a messenger who knew the place to transcribe it again. He found the stone gone, and that no trace of the unenclosed cemetery existed.

Such were some of the reminiscences suggested by the sight of human remains exposed to view in the trench.

Still pondering over the past, I reached home with my varied gatherings, and the barrowload of soft stuff soon followed. Some of this silt I still possess, and I propose now to show what can be got from it likely to interest students of microscopy.

The process of separating the organic remains from the purely mineral constituents is simple and easy, as the following directions for procedure will show: Put some of the silt on a clean plate in the oven, and let it remain there till thoroughly dry. Take it out, and when it has cooled down divide it into two portions, and put each into a basin and cover the lumps with water. After a good soaking, liquefy the whole and stir up freely. As the water comes to rest, a greyish film is seen on the surface. This consists of air bubbles and the little things we are in search of. Now take a tablespoon, skim the film from one of the basins, and put it into the other, in which the water had been left at a lower level. This ladling out reduces the water in the first vessel and leaves a crowd of organisms clinging to the side. Remove these to a bottle of water by means of a hair pencil, and then you have the desired objects, fairly free from impurities, available for examination. They will subside much more quickly in spirits of wine than in water. The next thing to do is to reverse the operation by lowering the water in the second basin, putting what is removed into the first one, and give its contents another stir up before making a gathering from the second. This alternate treatment can be repeated many times before the supply is exhausted.

I have just treated a small quantity of the dried silt in this way, and will now indicate the results. Foraminifera of the nautiloid type[1] are by far the most numerous, and there is an admixture of other forms of the same class. Of these, the graceful outlines of several varieties of *Lagena* readily catch the eye. A group of these (fig. 6) gives a good idea of the general appearance. The partial, yet distinct, similarity in form of some of these, and the Greek amphoræ figured on p. 232, will be seen on comparison. *Lagena* has but one chamber, and is imperforate except at the termination of the prolonged neck. From thence the delicate filaments that form the apparatus for catching food are protruded.

The next objects claiming attention are the bivalve shells, either together or separate, of small crustaceans belonging to the sub-class Entomostraca, which is represented in both fresh and salt water. In the living state these little shells, averaging about $\frac{1}{40}$ of an inch in length, serve to

FIG. 6.—LAGENA × 45

protect the body and limbs of each owner and occupant. The forms shown in fig. 7 sufficiently indicate the general character of these objects.

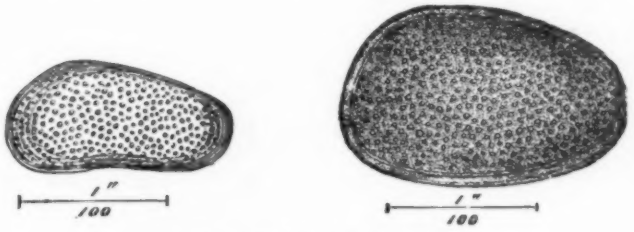

FIG. 7.—SHELLS OF ENTOMOSTRACA.

Diatoms also are here, but not in great variety. It is rare to meet with any other than the two

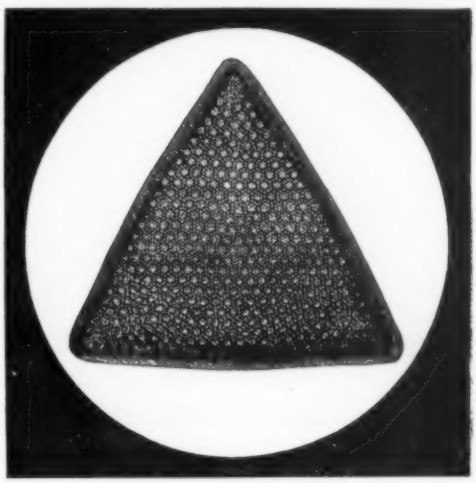

FIG. 8.—TRICERATIUM FAVUS × 300.

forms, *Triceratium Favus* and *Eupodiscus argus*, shown enlarged in figs. 8 and 11, and greatly enlarged

[1] See fig. 5, p. 247.

in figs. 9 and 10. They are so constantly present as to form a characteristic feature by which this estuarine deposit may be identified. In similar sedimentary beds on the west coast of England the one is very rare and the other is hardly known. I firmly believe that it is not possible to find a single ounce of the Sheppey alluvium in which these diatoms are not.

The following reminiscence will show that at least one of them is far from being scarce. At one of the Royal Microscopical Society's meetings, a well-known mounter of diatoms and other objects told me of the great difficulty he had in getting a supply of the triangular form sufficient for his purpose, and that, in fact, this was the one trouble of his life. On getting home I sent him about

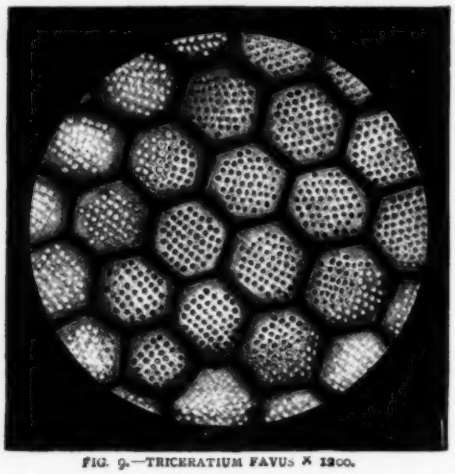

FIG. 9.—TRICERATIUM FAVUS × 1200.

seven pounds weight of this silt, and, to my great astonishment, received in return a cheque for a substantial amount, which was neither desired nor expected, and many warm expressions of gratitude,

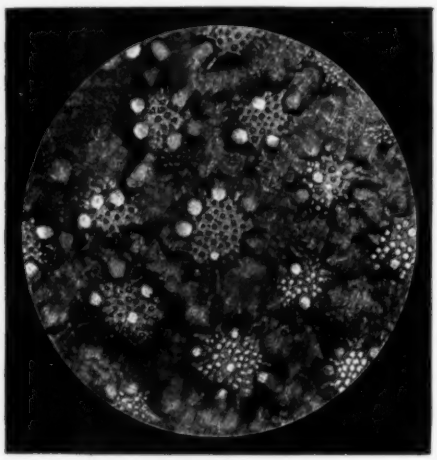

FIG. 10.—EUPODISCUS ARGUS × 1800.

coupled with the assurance that the trouble was now ended, as the parcel contained enough *Triceratia* to meet the requirements of business for the rest of his lifetime!

The plenitude of *Triceratium* and *Eupodiscus* to a considerable depth in the silt proves that they have existed hereabout for a longish period. By the use of the tow-net their presence in these waters now can be demonstrated at almost any time of the year. During the recent almost arctic winter, when this harbour was nearly frozen over, and numberless miniature bergs were drifting in the estuary outside the ice-belt along shore, on using the tow-net I found these two hardy forms healthy and abundant. They are evidently able to withstand rigorous conditions, and also to take up and appropriate for their own benefit a proportionately large quantity of silica from that held in solution by the circumambient water. So, when silted up after death, the plates, with all their ornamental details, successfully resist the action of destructive agencies. Just as now, it is probable that many other beautiful, but less silicified, and therefore more delicate, forms were associated in life with them. But such

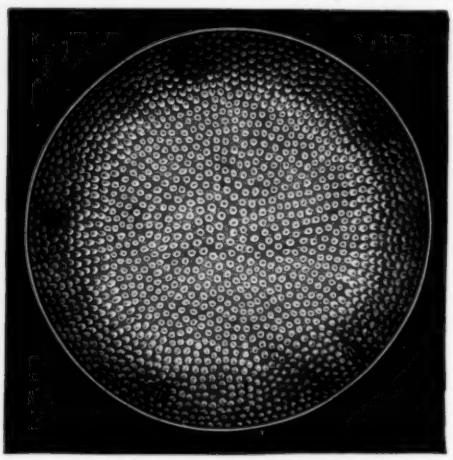

FIG. 11.—EUPODISCUS ARGUS × 250.

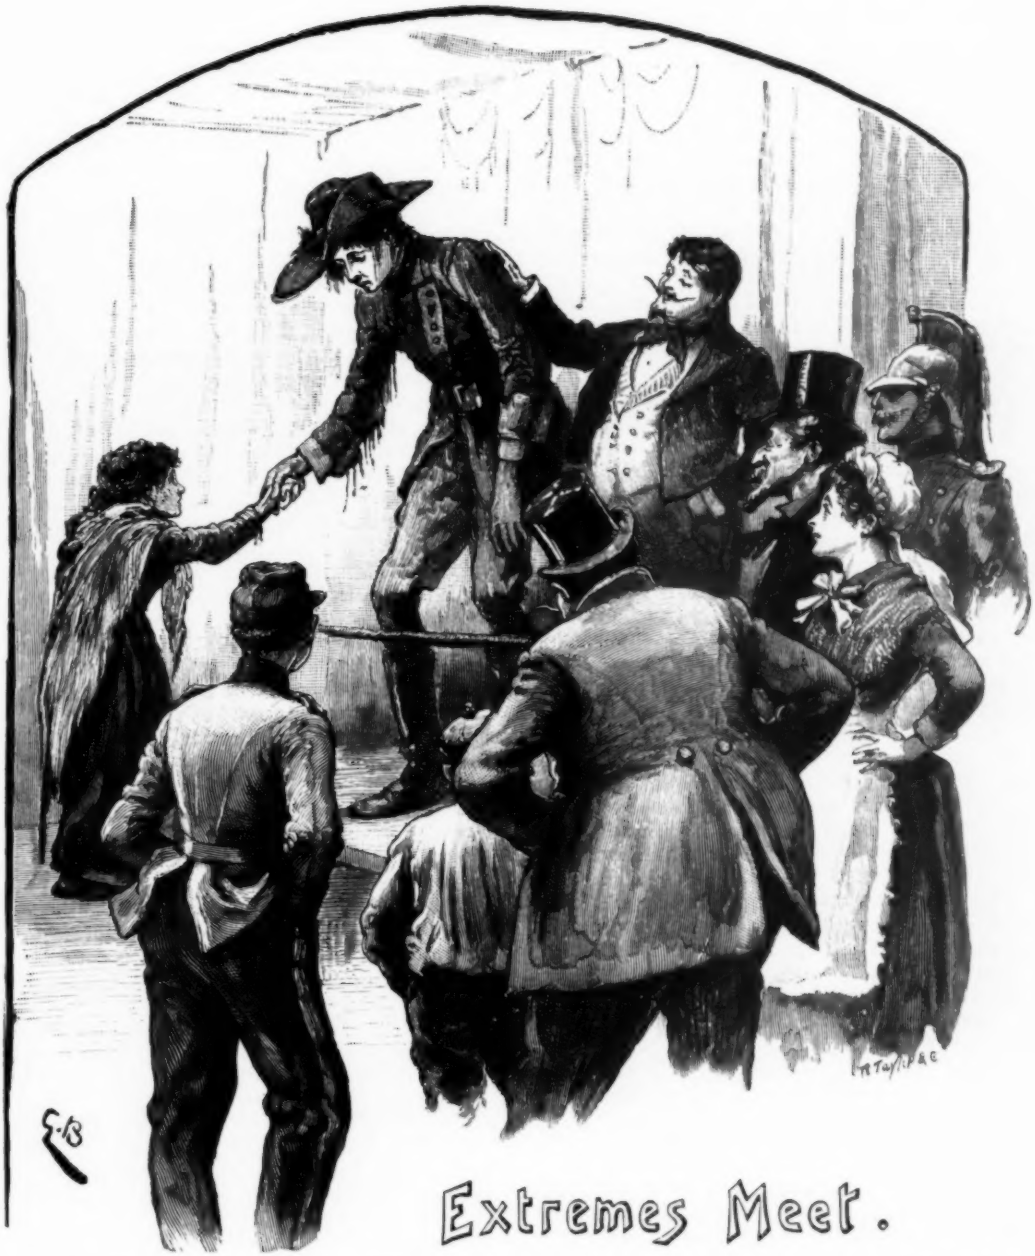
are not to be found in the silt. By their non appearance they negatively furnish an illustration of the important natural law that, even in death, the fittest only continue.

P.S.—Having a strong desire to be helpful to other students of nature who may not be favourably placed for obtaining micro-marine life, I am willing to try the experiment of distributing, *free of charge*, some or all of the organisms that have been described in this and other articles, on the following conditions:—



First, that each application for anything contained in a fluid medium be accompanied by a tube or bottle, securely packed, together with an *addressed label* and sufficient stamps for the return postage. In the case of dry silt, an addressed label and stamps will suffice.

Second, that the subject of the application be obtainable at the time.

Third, that the offer hold good for one month from the date of publication. This limitation of time is necessary in case the applications should be so numerous as to interfere with the proper discharge of my ordinary business engagements.

I can most conveniently send mud (in a semi-fluid state) containing diatoms and many other things, which can be separated according to directions given in these pages. For this material a three or four ounce corked bottle, which need not be wide mouthed, will be suitable.—W. H. S.

NOTE.—Figs. 2, 4, 6, 9, 10, 11 are from photomicrographs by E. M. Nelson, Esq., issued by the London Photomicrographic Company, 40 High Street, St. John's Wood, London.

# Extremes Meet.

THERE was a fête in the Champ de Mars. It was to continue for some days, and the attractions offered were diverse and interesting. There was the lady snake-tamer, whose portrait, displayed outside the booth, was a marvel of beauty, with eyes as large as a Waterbury watch fixed intently on what was apparently a boa constrictor transforming itself into a corkscrew. There was the shooting gallery where a procession of animals, as varied as those which populated the ark, marched with the regularity and steadiness of cardboard across the table at the end of the tent, in such manner that he who missed the elephant could not fail to strike the mouse—no great difference, since they were much of a size. And there were the performing monkeys, one of whom gave a dinner-party while the rest personated the guests and servants; and a lively dinner it was

though, whether the company discussed the Darwinian theory or only their food, it was not easy to understand. Besides these, there were acrobats and dancers, girls who swam in a tank and consumed bread and claret under water, a company of actors equally capable of comedy or tragedy, and the giant.

The giant's portrait was also hung outside his booth, but it was as much a fancy sketch as the unlikeness of the beauty. It represented a young man of muscular build, with red cheeks, black eyes, and luxuriant mustachios, who was attired in a costume that was something between that of a cow-boy and an Italian brigand, and whose smile displayed a set of teeth which would have driven an eager dentist to despair. By his side was depicted, for the sake of contrast, an ordinary individual in a frock-coat and grey trousers, whose chin was on a level with his companion's elbow, and who looked, and no wonder, depressed by his position.

This very attractive work of art was not the only advertisement of what was to be seen within. There was also a tremendous boot which was suspended over the entrance to the booth, and beneath this stood the showman.

"Behold," he said, "the boot of the world-renowned giant, Grandiosus Legrand! This boot, ladies and gentlemen, is authentic. Indeed, when Grandiosus has chilblains, and in the winter he suffers from them occasionally, he actually cannot put on this boot. We then have to supply him with carpet slippers, and these slippers are afterwards sold as beds for infants. I speak nothing but truth! His hand too! See his hand! Your hand, Grandiosus!"

At this point the on-lookers were thrilled by the sight of a large white hand with very thin fingers which was pushed through the curtain. The little boys crept closer to their fathers, and the little girls trembled at the thought of going to bed at night.

"You can form no conception of its size," said the showman, "unless I put mine by its side. I am not a small man. I cannot wear ladies' gloves."

He laid his plump brown hand against that of the giant, who closed his fingers over it and enveloped it.

"Now," said the showman, "walk in! walk in! If I have deceived you, you shall have your money back. Walk in! walk in!"

The people crowded into the booth.

Among those who had come to the fête was a little woman, a very little woman indeed. She was young, but no one would have known it, because she had neither the beauty nor the freshness nor the charm of youth, and she was deformed and twisted and ungainly. And she was sad because she knew that no one would ever love her or praise her as other women were loved and praised, even although her soul was lofty and she was pure in heart, and refined and sensitive and gentle.

Marthe gazed up at the picture of the giant. How wonderful, she thought, to be big and strong like that, to be able to look down at other people and to know that they could not despise one, to feel that one could fight against the hard world and conquer it. What a happy man the giant must be!

That was her first thought. Then there came another.

Perhaps he wished he were not so big. Perhaps he was as uncomfortable at being always the tallest as she at being always the smallest; perhaps he was as weary of looking down at his fellows as she of looking up. Who knew? And if so, how strange it was that he should have too much and she too little, and that both should be set apart.

She wanted to go in and see the giant, and yet she had hardly the courage, she was afraid that people would point at her, and she feared ridicule because she was not hardened, and because she realised all too well her own deficiencies. Yet if they all looked at the giant, perhaps they would not notice a little deformed woman, who was protected by misfortune and poverty.
